A temperature not over 60° in Summer, and not below 45° in Winter.

Perfectly clean utensils, and very little light.

It matters little how or where these conditions are secured; that they *are* secured is sufficient. The following reasons may be given; viz., milk readily absorbs odors and the odors are concentrated in the cream, with stagnant air the natural odor of the fresh milk, which is disagreeable to some persons, cannot be removed; in the dry air the cream becomes of a leathery toughness and often produces specks in the butter, and always makes an inferior quality. When milk is kept on the ground in a cellar or milk-house, it is brought into contact with the coldest air in which all the bad odors of the place are condensed. At a higher temperature than 60° the milk will sour and often thicken before the cream has risen, and to have the best butter, the cream should be taken from sweet milk. At a lower temperature than 45° the color of the cream is much lightened, and the butter will be too light in color; besides, there is danger of freezing, and frozen cream will not make good butter. If the milk pans are not quite sweet and clean, the milk will sour too soon. With too much light the butter will not have the rich, deep color that is desired.

When the milk is brought in from the cow-stable or the shed, it is strained at once into the pans, and these are put away in the place provided for them. If it is not strained at once, some cream will rise, if the milk is rich, and this cream will be caught in the meshes of the strainer and be lost. Before the milk is poured out of the pail it is safe to first pour out a quart or so and return this into the pail; this will remove any stray hairs that may have fallen on to the outside of the strainer spout or lip of the pail. This is more especially advisable with those pails the strainer of which cannot be wiped with a clean cloth. The improved strainer pail, described in the last article—which, by the way, is my own invention and is not patented—may be easily cleaned or wiped to remove any hair, dust or other impurity which may have fallen on it. In placing the milk pans on the shelves, it will be found convenient to have them arranged in regular order and to retain this order always, so that there is never any doubt about the right pans to be skimmed. The shelves may be arranged so as to make this very easy and not to move any pans; but if but one shelf

is used, the pans must be moved along to fill the place of those skimmed at one end and make room at the other end for the fresh milk. Hereafter I shall describe my method for arranging the shelves in a convenient way for this and other purposes. The pans should never be covered. If it is necessary to cover anything to exclude flies, mice or other vermin, the windows should be covered with fine wire gauze, and to guard against mice the shelves should be purposely arranged. (This will be explained by-and-by.)

When the milk has stood 36 hours the cream will have risen, and should be skimmed off. At this time the cream will be thick and adherent, and on good milk that has been set two inches deep in shallow pans, should be at least a quarter of an inch thick. This will give 12 per cent. of pure cream, which is as much as I have ever *known* any cow to give, although it has been often said that such a cow gives 25 or 30 per cent. of cream. One of my cows will show 28 per cent. of cream in a five-inch-deep test-glass; but this is not pure cream. This same milk set in a 20-inch-deep pail will show about six inches of cream; but when cream rises in a deep vessel a large quantity of milk is brought up with it and stays with it, and the 28 per cent. which is shown in a deep Cooley pail, shrinks in a Ferguson Bureau pan to 12 per cent. There is an advantage, however, in this diluted cream, which is, that it is in precisely the best condition for good churning; while in skimming the pure cream at least an equal quantity of milk should be poured off with it into the cream jar, and both be stirred up together. To remove the cream, a small, flat cream knife should be passed around the edge of the pan to loosen it, and the film of cream is then floated and pushed with the cream knife over the edge of the pan into the cream jar. This will remove enough milk with the cream to dilute it sufficiently. Every time cream is poured into the jar it should be stirred, otherwise there will be danger of having white specks in the butter.

A GOOD FAMILY COW.

I have often admired a little Alderney cow belonging to a lady friend, who modestly wishes her name not to be made public. Simply to look at such a cow is suggestive of creamy milk and golden butter. A few days since I had a talk with this friend about milk and butter, during which she showed me her account with this cow, the only one she has. A family of twelve (including servants) with occasional visitors, have to be supplied with milk; but she has generally managed to save one milking each day for butter.

She began keeping an account on the 28th of February, when the churning yielded five pounds. On the 25th of August (the day before I saw the account book) the churning gave four pounds and a half. The whole amount of butter made during the interval of six months was one hundred and ninety-one pounds. This, it seems to me, is a great show from a small cow when you take into consideration the prolonged drought, and that a large family was supplied with milk at the same time. If all the milk had been saved for butter the result would have exceeded four hundred pounds for the six months; and the lady thinks she does better than this when there is plenty of good grass. She is very careful to know that the cow is well cared for and gently treated.

I find from the dates that there were two churnings a week, those in the first week in March yielding eleven pounds, and the next week, nine and one-half pounds. In the first week of June the yield was ten and a half pounds, and in the two following weeks it amounted to nine and ten pounds respectively. The last two churnings (August 25) or one week, gave eight and a half pounds. The reader can get the weekly average from the figures before given, but he must keep in mind that only one milking a day was saved for butter, and that hay had to be used for feed during a part of the drought. I have more than once eaten the butter, and can ask for nothing more delicious. I inquired, "Do you ever use artificial coloring for your butter?" The reply was decidedly earnest and characteristic. "No! I don't want any frauds about my butter." This case is given to show what can be done with a good cow, good food, kind treatment, and a goodly share of the "know how;" and this "know how" might be learned by many who have all the requirements for keeping a nice little Alderney.

PETER B. MEAD.

THE OUTLOOK FOR CHEESE is favorable for good prices. The make in England is reported by the best authorities to be small and imported stock has been sold close up to arrival. In this city dealers say accumulation is not extra-heavy, while reports from the chief cheese-making regions indicate that the stock held back is, as a rule, comparatively light. It is probable therefore that the present slight depression will be only temporary.

The Herdsman.

NOTES.

BY A STOCKMAN.

"ROOTS are a joy to shepherds, but a cause of anxiety to masters," says the Agricultural Gazette. Unfortunately we are not in danger of suffering much anxiety in this respect, for our supply of roots is not so liberal that sheep are likely to be over-fed with them. This too applies more to these succulent, over-grown roots that have been highly manured with superphosphate, than to our more solid ones, grown upon less highly fertilized land. But the caution is worthy of regard, because an over-feeding of roots in cold weather is dangerous to in-lamb ewes and so chills the internal organs as to endanger the vitality of the fetus.

WHAT is the reason that we, handicapped as we are with high-priced labor and the enormous burthens and risks of long railroad and shipping charges, can compete in foreign markets with the native farmers and beat them by a large margin in prices, if not in quality? Perhaps the gentlemen who came from England to investigate this problem have not yet solved it completely. They have missed, it maybe, one very important condition of the problem. For instance, in a recent issue of the London Times there were two leading articles side by side; one discussing this very question as it was affected by the importation of American meat and bread, and its influence on English agriculture; and the other referring to the opening of the season for partridge shooting. To hunt and shoot, over the farms occupied by their tenants, game that has been fed upon the crops grown by those tenant farmers, and at their expense, is one of the privileges exacted by the owners of the land, and five hares consume as much as one sheep, while partridges and other feathered game consume and destroy a large portion of the grain. How large a part in the solution of this question do these facts comprise?

Do sheep owners realize the loss occasioned every year in the condition of their flocks by the abounding sheep ticks? It is rare to see a flock that is not grevionsly annoyed by these pests, and the sheep are constantly nibbling in their fleeces to allay the irritation caused by them. I have known lambs to be so pestered with ticks, after the sheep have been sheared and the ticks deprived of shelter have left them and gathered upon the lambs, that they have died in consequence. And yet there is an effective remedy, viz: dipping the lambs early in the season or both sheep and lambs later. The most effective dip is an infusion of tobacco and sulphur. The late Mr. Grant, the large sheep owner of Ellis Co., Kansas, once told me that the produce of wool was increased 20 per cent. by two dippings in the year, one immediately after shearing and one in the Fall. The sheep and lambs feed and thrive so much better from the ease given to them as to make this difference. From my own experience I am sure he did not overrate the benefit and profit.

THE French people have more ready cash in individual possession than any other nation in the world. It is not the wealth of a nation that makes the people rich, but the general diffusion of wealth. This is the case in France. The French are a nation of small farmers. There are more land-owners in that country than in America. The farms are small; the majority are under 20 acres, and a very large number under 10. It may not be that this is the only reason for the money wealth of these people; they are notably economical and thrifty. But the small farms have something to do with it. The farmers of some of the eastern counties of Pennsylvania, where the farms are comparatively small, could well compete with the French in their possession of money wealth. Almost every farmer has his hoard invested. These men have a habit of feeding a few head of beef cattle or a flock of sheep every Winter. They sell little grain but wheat, and feed their fodder and coarse grain to purchased stock. They make more profit to the head of stock than is made upon large grazing farms, and their land is rich and high-priced, because of the large quantity of manure that is made in feeding stock. The consumption of meat is continually increasing and with the extension of manufactures there are more mouths to fill every year, so that it is not probable the supply can ever become excessive.

WHAT shall be the farmer's domestic meat supply? This is worth considering as well as what he shall produce for sale. The farm should feed itself, for it is a waste of money for a farmer to employ a butcher to cater for him. Beef is out of the question unless it is salted, and salt beef is only a makeshift enforced by obvious circumstances. Poultry and mutton will furnish a constant supply, with occasional helps from other sources. Mutton hams cured and smoked are excellent for Summer use, and if the legs are cured a carcass of mutton can be easily disposed of in a farmer's family. This is a very important item for consideration, when a farmer asks himself "Shall I keep a few sheep or not, and what kind shall I keep?" If I were to advise him in regard to the latter point, for domestic use I should say, Merino grades crossed with South-Down.

The comparative value, in some cases, of sheep and cattle is curiously shown in the instance of the Falkland Island Company which occupies the island of that name in the Atlantic Ocean east of Cape Horn, and Patagonia. This company owns more than 100,000 sheep, which have been obtained by crossing the native South American kind by Cheviot rams. The income from this flock is $150,000 annually, while from nearly 30,000 cattle the yearly product is only a few thousand hides. In speaking of this company, a contemporary not quite a thousand miles from where geographies are published, mentions "the adjacent country of Buenos Ayres." It is a question if two places distant from each other more than 15 degrees of latitude can be called adjacent. This reminds me of a citizen of the Quaker City at the recent sheep exhibition, who was admiring a pen of handsome Merinos; looking at the card, he remarked to me. "These are Merino sheep; Merino? Merino? where is Merino? I suppose these sheep come from there, don't they?" To which I wickedly replied "Why yes; of course."

Sheep Husbandry.

ENGLISH MOUNTAIN SHEEP.

YOUR mention of the Herdwick Sheep (in the Fair No.) reminds me of a circumstance which happened many years ago, and which may be of interest to your readers. I was visiting England when a young man, nearly 30 years since, and passing through what is known as the Lake region, found myself in a picturesque country of beautiful lakes, but very small to an American view, embosomed in mountains and woods, with most charming dells and valleys interspersed. Here were the homes of the poets and the Cumberland mountain sheep; and the latter I must say were the more interesting to me. Rydal Mount, the home of Wordsworth; Grassmere, the home of Mrs. Hemans, and the little lodging house where Hartley Coleridge stupified himself with opium, and every night after a debauch drank up, in his burning thirst, even the water provided for his oft-forgotten ablutions, were all visited as a matter of course, but left few pleasing impressions for their human connections. The grand beauties of Helvellyn were more to my taste, and on its slopes and crags I made the acquaintance of the flocks of Herdwick sheep and the shepherds to the manor born, with their wonderful dogs.

Low down on the mountain side I came across a man gesticulating somewhat in the manner of an old-fashioned semaphore telegraph. Waving his arms and throwing his cap, with a face set steadfastly up the mountain, one could not but follow his view. Away up among the mountains small patches of gray could be seen moving over the slopes and gathering into a central mass. These were sheep which were being collected by the dogs in obedience to signals given by the shepherd at least a mile below. Having a good view of the slope, the latter could see the scattered sheep, and could direct the dogs to them, where they were grazing behind huge jutting crags, but out of sight of the sagacious animals. In a short time the sheep were collected, and not too soon, for the clouds were fast gathering on the mountain and the storm foreseen by the shepherd was near at hand. Down the mountain, pell mell, over rocks and ravines, galloped the sheep with dogs on their flanks and rear. The flock was soon on the road and driven homeward. As I followed, talking with the shepherd, another large flock appeared in front quite filling the road. Here seemed to me a dilemma—how could these meeting flocks avoid getting mixed, and if mixed what could separate such half-wild creatures again? At a word the dogs darted ahead and in a moment crowded the sheep to one side of the road; the other flock was turned in the same way to its side of the road, and, like two passing trains, the flocks scampered past each other in two long lines, separated by a narrow space in which the dogs were. It was my first experience with mountain sheep and shepherd dogs, and as I trudged along the road in company with the shepherd—one single man in charge of more than 3,000 sheep, but having a score of dogs to help him—he related to me the most wonderful stories of his dogs, and of his sheep as well.

But to make a practical application, let me say that these sheep make profitable the poorest possible pastures. The mountain sides, covered with heather and scrubby vegetation, furnish pasturage which is turned into useful wool and the best of mutton for flavor. The annual rental of such mountain pastures in consequence of this use, affords a considerable income to the owners of the land, and the farmers make good profit from their flocks Some time we shall be glad to have such sheep on our mountain ranges which are now totally useless, but which will then afford subsistence to many shepherds and much wool for our coarse manufactures. H. S.

CLOSE CONFINEMENT OF SHEEP DURING WINTER.

I HAVE a small flock of pure-bred South-Down sheep, but shall Winter only about 60. I shall let them run daily on a 100-acre pasture lot whenever the weather is not too rough, feeding them nights and mornings with rowen hay, and once a day with half a pint of grain or other stimulant. I shall give all those ewes lambing early a few carrots and a little corn meal, and I shall let these as well as the rest run out in the sunshine a few hours every day there is any; and even if snow is lying on the ground, that will not prevent them from going out for two or three hours. I will give a report next Spring and show that these South-Downs will have more and better lambs than any ewes managed in the usual coddling way. I mention this and confidently make these assertions, because through some stupid mistakes, it is over and over again repeated that English sheep cannot be kept except in small numbers; that they cannot live exposed in rainy weather, and although nobody attempts to compare Merino mutton with theirs, yet it is really thought the Merinos are hardier. The fact is, that in England every farm of about 300 acres keeps more sheep than many a thousand-acre farm in the United States, and the farms of that size also grow double the grain and support double the cow stock, in addition to the sheep, that any farms of the same size in America do.

In consequence of less roots being fed in the United States, the young sheep do not grow so fast, and the first fleeces shorn are not half as heavy as those from yearling sheep in England. I am aware that South-Downs have much less wool than other breeds, and that the Oxford-Down has much longer wool, and that the fleeces weigh about double the weight. The Oxford Down is an example showing the folly of some breeders in being so very much opposed to crossing; for this breed was perfected from crosses. G. G.

The Horseman.

BREEDING TROTTING HORSES.

IN an admirable article on this subject in the Kentucky Live Stock Record, it contends, in order to obtain those of first-class performance, for a copious infusion of thoroughbred blood, either late or remote. In this we entirely agree with our respected cotemporary, for how else could the fine form and limbs, high spirit, intelligence, indomitable will and endurance that characterize our best trotters be obtained. Not from the cold-blooded horse surely, for where have these ever been found in him to any remarkable degree? But the advocates of cold blood say that he gives the trotting action. Admit this, and what would this action amount to, when great speed and endurance were required, unless well fortified with crosses of the thoroughbred. Yet several of the latter, it is said, occasionally possess fast trotting as well as running action. This we believe was particularly the case with one or two of the progenitors of imported Messenger, the fountain-head of the best American trotters.

Although admitting the value of pacing blood in assisting to make up some of our fastest trotters, still our cotemporary prefers that of the racer, if he must choose between the two, when a fresh cross is needed. In this again we think he is right, notwithstanding the pacer has undoubtedly a large infusion of the thoroughbred in his composition. This may be seen in the fine high-spirited amblers and pacers, bred pure or nearly so, in Cuba and Spain, from the Andalusian, which is a direct descendant from the Barb brought over from Africa by the Moors, when they invaded Spain many centuries ago.

It is contended that the progenitors of the fine-limbed Narragansett pacer, so famous for years past for speed and endurance, were brought from Cuba to Rhode Island in vessels engaged then in the West India trade: and that the pacers of Kentucky and Tennessee are high-crossed descendants of the thoroughbred, which have been going on ever since the first settlements of these States.

Now as to what is thoroughbred, our cotemporary says the fifth consecutive cross from the cold-blood horse is admitted into the Eng-

lish Stud Book as pure. Not being familiar of late with this publication, we desire to ask if that is the rule which now governs it? If so, would our cotemporary admit to his Stud Book, if the editor of one, a fifth consecutive cross, originating on the dam's side from a great coarse English Lincolnshire black mare, standing perhaps 18 hands high, and weighing 2,000 pounds with little better or faster action than an old cow? For our own part, we should fear the cart-horse blood of such an animal would crop out every little while, to the injury of the racer down to four times a consecutive fifth cross from him, if not for a whole century or more.

SADDLE HORSES.

At the present moment there is a great market in England for almost every variety of agricultural produce, but prices for the general run of such animals as are exported, though satisfactory to the common graziers and stock farmers, are not high enough to tempt men of capital to breed, raise and prepare them for market.

Raising trotting and other horses does not remunerate very highly, because so few become fast enough to sell for the best prices, and as trotting is an unnatural pace to race in, a great deal of expense is necessary to keep and pay trotting men to handle the colts. Breeding race horses is no better, on account of the tendency among thoroughbreds to grow light and weedy, so that should they fail in being fleeter than the average there is no demand for them.

Now, as the best saddle horses in England are always in demand, and those of extra merit sell for very large sums, any gentleman who would go intelligently to work in selecting dams of powerful frames and using a stallion of the most fashionable blood, might secure an income of many thousands per annum by such management as would bring out from 10 to 20 young horses just fit for riding in the chase, and the thousands might be tens of thousands if with proper breeding and management, these young horses were large and strong enough to carry gentlemen of heavy weight up to the hounds.

The art of successful stock farming consists in producing such animals as will sell for great prices without being obliged to expend heavily in preparing them, and these animals can be brought out fit for sale without any expensive training.

Saddle horses commanding prices equal to those of the best trotters here will require no breaking to harness, for it would be a serious drawback to a valuable hunter to have been used in any way in harness. G. G.

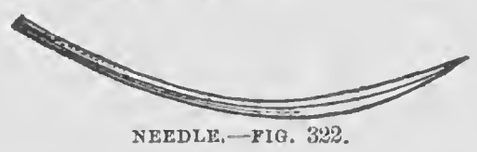
Veterinary.

TREATMENT OF WOUNDS IN ANIMALS.

Accidents *will* happen even with the greatest care. But as a rule we are not careful and run risks recklessly. It would not be so bad if means were always at hand to repair damages. Almost every careful farmer has something upon which he can lay his hand to repair a plow, a wagon or harness; but if his horse runs into a fence, or is kicked in the stable, or happens to meet with any such common accident, or a cow is hooked by a cross companion, there is running hither and thither for help, and no help at hand. And so the damage is greatly worse in its effects than it might otherwise have been, and an animal may be lost or seriously reduced in value for want of ten cents' worth of material and a very little foresight. Wounds in horses or cows are mostly superficial and consist of cuts or lacerations of the skin and subjacent tissue. These are very readily healed by prompt and proper treatment.

The first thing to be done in case of such a wound is to secure the animal, if any surgery is to be performed, as cutting or stitching. The wound is then to be cleansed with cold water, which tends to arrest the bleeding, while warm water encourages it. If the lips or edges of the cut or tear will not be subjected to severe strain by the movements of the animal, they may be held together by plasters of common black pitch, or of an adhesive mixture of melted resin and tallow or beeswax, spread upon stout cloth, such as strips of bed ticking or strong sheeting. The plaster is cut into strips about one inch in width, and is applied to the shaved skin, in such a manner as to resist the strain which would open the wound. Openings should be left in the lowest portion of the wound to permit the escape of pus that may be formed, and to inject any stimulant needed to produce healthy healing action. But it is always safe to close a wound with stitches.

Surgical stitches are made with a curved flat needle, having a thin, sharp-edged blade, which will cut its way through the skin. It is very difficult to force a round needle through tough skin, and for this purpose a needle shaped as shown at figure 322, is used. This may be used for a delicate operation and the coarser needle shown at figure 323—which is a

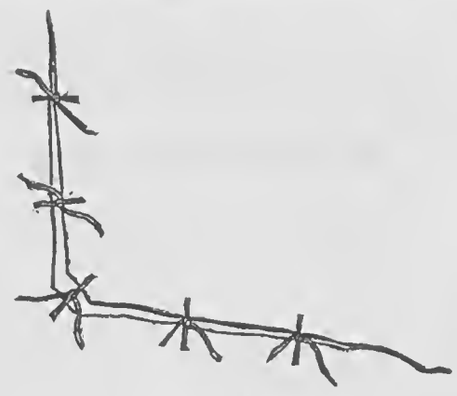


NEEDLE.—FIG. 322.

common packing needle—may serve for rougher work. The needle should be kept sharp and whetted upon a fine stone to secure smooth, keen edges to the blade, which will enable it to pass through the skin with ease and with the least pain. Usually the lips of a wound, especially when it is contused, as if made by a kick or blow, are not very sensitive and will

NEEDLE.—FIG. 323.

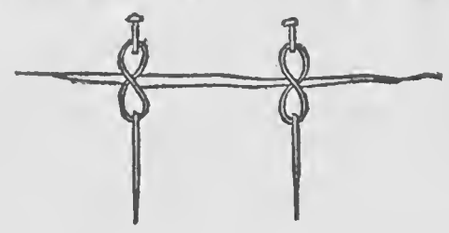
be all the less so the sooner the wound is operated on after its infliction. So that the operator need not be at all nervous about hurting his patient, and in fact the less he thinks of it the more easy will be the operation. The edges of the wound are pierced in places opposite to each other and the thread is drawn up and tied and then cut, leaving the wound as shown at figure 324, which is the form of a very



WOUND.—FIG. 324.

frequent cut or tear made by kicks or collisions with fence posts or ends of rails. If the laceration is irregular, the stitches should be placed where they will do the most good in supporting the parts and keeping them in contact until natural adhesion occurs.

Sometimes it is difficult to get the lips of a wound in contact, as where the injured part is hollow instead of prominent, and in such cases a quilled suture is made. This consists of placing pieces of quill or cylindrical pieces of wood, as sections of common lead pencil or peeled twigs of trees, upon each edge of the wound and passing the thread over these and tying the ends. This causes pressure to be exerted upon the lips which closes the wound. A very simple suture is made by passing a strong pin through the edges of the wound and winding a thread around the pin, and across the cut, in the form of a figure 8, shown



WOUND.—FIG. 325.

at figure 325. This is the usual method of closing the cut made by a lancet in the operation of bleeding.

To produce healing of a wound in a horse or a cow, some stimulant is nearly always required. This may be common spirits of turpentine or the compound tincture of benzoin or that of myrrh and aloes. Either of these may be applied with a feather once a day, or if the wound is deep, the stimulant should be injected to the bottom with a common squirt can or a syringe. Wounds should always heal from the bottom, and to secure this the opening should be kept free, by means of a plug of lint dipped in the stimulant used. Lint may be made by scraping a piece of linen cloth such as a towel, with a knife, and collecting the loose fibers. Linen only should be used, and never cotton or wool for this purpose. If pus is inclosed in a wound and the opening is permitted to close, an abscess will be formed, or the pus will be absorbed, with some future ill effect. In the case of deep, punctured wounds careful search should be made for the possible presence of splinters or other foreign bodies, and to enlarge the opening will often facilitate the search or assist in the ultimate healing.

If the wound bleeds freely during its treatment, it should be kept clear by means of a sponge or a soft linen cloth, as an old handkerchief. Profuse bleeding may be stopped by pressure by pads, or by twisting a towel or a strip of bag cloth above the wound, and sometimes by sprinkling upon it powdered sulphate of copper, or the dust of puff balls. Simple cuts may often be healed very quickly by cleansing the part and binding a pad of lint upon it, which may absorb the blood and form a clot which will protect it from the irritating effects of the atmosphere. Nothing else more irritates raw flesh than contact with air; and the first thing to be done to soothe the pain of a wound, is to protect it from the atmosphere.

Injuries to cows' teats are very common by one animal stepping upon another when the latter is lying down. Such wounds can only be treated by stitches so placed as to restore the injured parts to their natural position. To insert a silver milking tube into the teat, will help to keep it in position while the stitches are being made, and in this delicate organ the fine needle (fig. 322), should be used. The milking tube should be left in the teat so that the milk may escape as it is secreted. In such delicate operations as this, the use of photographers' collodion, which is made of gun-cotton dissolved in chloroform, will be of great benefit, as this substance painted over the wound with a soft camel's hair brush, forms an air-proof film which shrinks as it hardens and draws the parts closely together, as well as protects them from air.

The appliances needed to be kept on hand for use in emergencies are few and simple. They consist of the two needles shown; a skein of white, waxed silk; some of the adhesive plaster mentioned; some prepared lint; a small bottle of tincture of benzoin or myrrh; a piece of soft sponge; a soft, old, worn towel; a few stout pins; and, if possible, a foot or two in length of fine silver wire for making stitches, and lastly a silver milking tube. With these, kept in a safe place, ready to hand, one may always be ready to repair damages in case of accident, and possibly save a valuable animal from loss or serious injury.

Farm Economy.

CIDER VINEGAR.

The enormous supply of apples all over the country suggests the idea that a good part of them may be turned into cider vinegar with profit. Vinegar may be made direct from the apples, but it is much preferable to first extract the cider.

When cider is intended for vinegar it should be made with the same cleanliness as if intended for drinking or keeping, and the casks into which it is put for fermentation should be equally sweet, and if old whisky casks are used it improves the cider as well for vinegar as for drink.

There should be nothing added to the juice, as pure juice is best; the mustard seed, sulphite of lime, and other such ingredients used for stopping fermentation, injure the vinegar. The better the apples the better the vinegar, and cider made late in the Autumn from fruit rich in juices, is much better than that from windfalls and early-gathered fruit, as cider is better for the same reasons.

Vinegar may be made from crushed apples or from the pomace after the cider is pressed out, as is often done from the pomace of grapes and of other fruits. The apples are ground and put into shallow holders where they are left to ferment for a couple of days, then pressed and the juice put directly into old vinegar casks containing mother of vinegar. If the weather is cool the casks are placed where they will be kept warm, and in a few months the vinegar may be drawn off into clean vessels. The chief auxiliary to producing vinegar quickly is exposing the fluid to the air at a mild temperature, but for the best cider vinegar, where haste is not necessary, it is better to extract and barrel the cider, allowing it to ferment as in the best process of cider making, and then using the cider as desired. Most cider vinegar, and perhaps the best, is made by leaving the bung open and allowing the change to take place gradually, which will be in a longer or shorter time as the temperature is warmer or cooler.

Numerous methods are in practice by large manufacturers who purchase large quantities of cider and expose it to the air in large vats in various ways. One process is to allow the cider to run slowly over beech shavings; another allows it to trickle down over boards or shelves, while still another process is to force bubbles of air through the liquor continuously.

A French method consists in scalding the barrels with water and then pouring boiling vinegar into them and rolling them until the barrels are thoroughly saturated, when the barrels are filled about one-third full of cider vinegar and some two gallons of cider poured in each seventh or eighth day until the casks are two-thirds full. In two weeks from the time of adding the last two gallons, one-half is drawn off and the process repeated. The casks are kept as near a temperature of 80 degrees as possible.

This last process gives farmers a hint for producing cider as may be desired, by keeping the barrel in a warm place and adding cider to the vinegar barrel, or by putting a quantity of sharp vinegar into the cider.

The cores and parings left from drying apples may be used as above described, or they may be placed in jars or tubs and warm water poured over them, and set in the sun or other warm place for a week or ten days and the juice added to the vinegar barrel, or used with the addition of cider. The principle of vinegar making is fermentation, and this comes from the presence of sugar, and may be hastened by yeast or similar aids, but the best agent to produce fermentation is strong old vinegar. The richer the juice in saccharine matter the stronger the vinegar, and the warmer the temperature and the more the vinegar is exposed to the air the more rapid the process.

Industrial Societies.

THE QUEENS CO. AGRICULTURAL FAIR.

First Premiums to the Rural New-Yorker for Seedling Potatoes, Wheats, Corn and Oats.

(Rural Special Report.)

All things considered, I deem this one of the most efficient and successful fairs of the country. I am far from wishing to pay the Secretary a compliment such as is usually passed as a matter of courtesy on such occasions, when I say that to his intelligent, unremitting, courteous efforts seems to be due in a great measure the happy adaptation of all the fair machinery to the purposes which are intended to be subserved. There was no confusion or disorder anywhere. I heard on the part of visitors only words of praise, and, though 15,000 persons were collected together upon these grounds during Wednesday (the middle day), there was no department, no special class of articles, which could not be leisurely examined by everyone.

Only in the stock department was there an approach to failure, and in that the failure was well-nigh complete. A Guernsey bull or so, several Jerseys and Short-horns; a few South-Down ewes and bucks and a dozen hogs—Poland-Chinas, Berkshires, Yorkshires and Chester-Whites—completed the exhibit. The poultry department was, however, as usual, varied and extensive.

Among farm implements, Kemp's Manure Spreader, described in our fair reports, attracted a good deal of attention and favorable comment. A better display than usual of reapers and mowers, pulverizing harrows, grain and fertilizer drills of many kinds, was well arranged over the lawn appropriated to this department. The beautiful "Twine Self-binding Harvester" of the Walter A. Wood M. & R. M. Co., attracted while in motion such crowds of people that its continued action was not deemed desirable.

The display of vegetables, grain, etc., was one of the best, both in quantity and quality, ever exhibited. Mangels and beets, cabbages and pumpkins were of immense size. The Rural New-Yorker took the first premium for varieties of wheats and seedling potatoes. Twelve ears of the Chester County Mammoth Corn also took the first premium for heaviest ears, and the Blount for the greatest number of ears on a stalk. The Mold's Ennobled Oats also took the first premium as the best in their class. Thus the Rural's first exhibit at fairs has proven very gratifying, everything which was entered for competition having taken a first prize.

The Rural Branching Sorghum elicited many remarks from farmers who read the explanatory labels. It is a suggestive fact that most visitors do not read labels, unless they are in conspicuously printed letters or the article itself excites the curiosity to further inquiry. Upon each plate of seedling potatoes the Rural had been at the pains of writing upon the label the number of eyes planted and the exact weight of yield in pounds. I did not observe one person who seemed to notice it—as if the potato itself, and not the yield, were all that it was worth while to look at. Again, I have never seen the fact better demonstrated that size is with judges, among vegetables as with fruits, that which determines the awards of premiums. The first premium for late potatoes was given to the largest potatoes, with large, goggle eyes and homely shape, while a bushel of Late Snowflakes of uniform, medium size and perfect symmetry, with small, surface eyes, were passed over as if they had been buried in the earth. It was the same with the mangels, beets, squashes, pumpkins, sweet potatoes, etc., etc.

Mr. Ricketts exhibited at this fair his grapes for the first time. Among them was one which struck my fancy immensely. It was numbered 97, and is a seedling of the Concord and Trentham Black. The bunch is very large, loosely set; berry very large—as large as the monstrously exaggerated pictures of Moore's Early—black, blue bloom; flesh tender, aromatic, sweet, vinous, juicy. Mr. R. says the leaves

are large like the Concord and the vine thrifty. When offered for sale, this grape, possessing, as it does, both size and quality, must commend itself to the public taste.

In speaking of potatoes, I had almost forgotten to mention the White Elephant, a plate of six of which was placed among the seedling display. I should have said *two* plates, since two were required to hold them. These were the largest potatoes exhibited, each one equaling the size of the cut in your Fair Number. It happened (when their merits were being discussed) that a lady was standing by who had eaten several of the White Elephants which had been sent to her by one of the editors of the RURAL. She pronounced them, notwithstanding their size, of excellent quality.

The floricultural display was beautiful in detail and in arrangement, occupying the entire space allotted to it and, in fact, crowding other departments. It well deserves a special report to itself, which I am aware, at this time of fair reports from all parts of the country, your space would not permit. The pomological exhibit was also full and well worthy of extended remark. It was very evident here as elsewhere that fruit of all kinds had ripened considerably earlier than in average seasons.

The RURAL tent, which was pitched in the middle of the grounds, served not only as the headquarters of the RURAL family, but as a convenient resting place for many personal friends and inquiring strangers. The venerable proprietor of the RURAL NEW-YORKER and his wife (the father and mother of its editor) now between 70 and 80 years old, were "keeping house," and as hale and happy as their children and grand-children who flocked about them. Such references perhaps may not here be in place, but I may be pardoned for expressing the hope that they may yet long live to enjoy the marked effect which their Experiment Farm, and the RURAL NEW-YORKER are exerting upon the agriculture of our country. MAJOR.

NEW JERSEY STATE FAIR.

(Rural Special Report.)

THIS fair was held at Waverly from Sept. 20 to 27. The attendance was very large throughout, and the fair a complete success financially considered. With a few things corrected by the officers of this society, the New Jersey fair might rank among the foremost of those of her sister States, and perhaps outstrip some of them in point of attendance. Officers of *this* association, as well as some others, will soon be taught that an agricultural State fair is a place for farmers to exhibit their products and to gain information from their neighbors' exhibits, and not a place for all classes of fakirs, side-show-men and horse trotting, and the sooner this lesson is learned and applied, the sooner will more of our intelligent and progressive farmers become interested in these meetings and aid in their advancement.

The show of poultry was particularly noticeable and the exhibits fine in every class, the breeds being Asiatics, Hamburgh, Spanish, American, Polish, French and Bantams. The attractions in this department were increased by the exhibition of an artificial hen engaged in hatching chicks by the dozen. The competition on cattle was confined to the State of New Jersey alone; but the exhibits in Jerseys, Ayrshires, Devons, Short-horns, Herefords, Holsteins, as well as the show of natives and grades, were fine, and did credit to the exhibitors.

There was also a very fine display of agricultural implements, and while the variety and number were not so large as at the New York and some other State Fairs, still the exhibits were good, and the exhibitors present found many purchasers for their machinery and implements. A Western Plow Co. more ambitious than some of their Eastern competitors, believing that New Jersey farmers are interested in improvements made in plows as well as in other implements, exhibited, through their general agent, a full line of plows, from a single-horse to a three-horse plow, and during the Fair sold over a car-load to New Jersey farmers. This fact not only shows that the plow was popular, but that the farmers of New Jersey are keeping up with this age of progress. R. H. Allen & Co., of New York, had a full line of the agricultural implements and machinery of which they are the manufacturers and general agents, and this was an important feature of the exhibition.

MR. A. M. FORRESTER, exhibited the Belle City Feed Cutter, made by David Lawton, Racine, Wis. This machine is simple in construction and very strongly and durably built. It cuts four lengths of chaff, varying in length from one-third of an inch to two inches, and the change is made without taking off or putting on extra wheels. By a simple device the operator can stop and reverse the rollers, in case of accident, or when a piece of iron or wood gets into the machine. Both first premiums for hay and fodder cutters were awarded to this machine at the Pennsylvania State Fair, Sept. 1880; and also the first premium at the New Jersey State fair. G. B. B.

Scientific and Useful.

SIGNIFICANCE OF ACTIVE NITROGEN FOR GRAIN.

PROFESSOR F. H. STORER.

THE importance of active nitrogenous manure for the cereals and the capacity of leguminous crops to thrive without nitrogenous fertilizers, on fairly good land, are well illustrated by some field experiments of Professor Heiden, at Pommritz, in Saxony. In so far as the present statement is concerned, these experiments prove nothing new. The facts they illustrate have been known for many years. But there is never any harm in looking at such facts occasionally from new points of view, and the well-known accuracy of Professor Heiden as an investigator gives special value to his results and insures for them a permanent place in agricultural literature. In these experiments crops were grown during nine consecutive years, both on land that received no manure and on land that was manured repeatedly with sulphate of ammonia. The experiments were made on newly broken, heavy, strong soil which had resulted from the disintegration of granitic rock. Each of the plots measured one square Saxon rod (18.44 square metres). Upon the plot which was manured, 1,000 grammes of sulphate of ammonia were distributed and worked in with the utmost care at the intervals recorded in the table. During the year 1868 the plots were spaded four times but nothing was sown upon them. The subsequent cropping will appear from the table. The weights of the crops obtained are given in grammes, as stated by Professor Heiden. Inasmuch as the figures have no value excepting as they serve to compare the results one with another, there is no incentive to change them to their equivalents in pounds and ounces.

Crop Grown.	In the year.	Manure used.	Am'ts Harvested. Grain.	Chaff and Straw.
Oats.	1869	No manure	820	2,090
		Sulphate of Ammonia applied in 1868	3,090	5,885
Oats.	1870	No manure	89	320
		Sulphate of Ammonia applied in 1868	89	322
Oats.	1871	No manure	167	523
		Sulphate of Ammonia applied in 1871	5,267	9,185
Vetches.	1872	No manure	1,666	6,399
		Sulphate of Ammonia applied in 1872	2,233	7,214
Rye	1873	No manure	825	2,523
		Sulphate of Ammonia applied in 1873	4,298	13,522
Clover.	1874	No manure	.....	12,472
		Sulphate of Ammonia applied in 1873	.....	3,942
Rye.	1875	No manure	1,595	3,730
		Sulphate of Ammonia applied in 1873	1,190	2,643
Peas.	1876	No manure	4,220	7,030
		Sulphate of Ammonia applied in 1873	2,035	6,700
Rye.	1877	No manure	970	1,902
		Sulphate of Ammonia applied in 1877	8,380	10.568

The importance of the nitrogenous manuring for the oats and the rye is most conspicuously set forth, as well as the comparative indifference of the leguminous crops, viz., the vetches, the clover, and the peas. One interesting feature is the good work done in 1869 by the sulphate of ammonia which was applied in 1868; and another is the absolute inefficiency of this old manuring in the year 1870, which appears, however, to have been an unfavorable season, anyway. In noting the better yield of clover from the unmanured land in 1874, and of peas in 1876, it is to be remembered that the soil of the unmanured plot had been less strongly cropped in previous years than that which had been manured. It is the special merit of the active nitrogenous fertilizers that they enable grain to put to profit the natural strength of the soil more fully than would be done without their aid.

Miscellaneous.

STRENGTH OR FASHION IN WAGON WHEELS.

A MAN brings his wheels to a smith and says: "Now, I don't want you to dish those wheels," "All right," says the smith, and he sets the tire, and in a few weeks they need setting again, because they were not put on tight enough, so that the person who wants his wheels kept in the fashion has to pay for it. The same is the case with axles on light wagons. The wagon is brought to the wheelwright, and the owner says; "The axles on this wagon are straight (or 'bent down,' as the case may be,) wouldn't they be stronger if bent up?" In reality what he means is, "Wouldn't they be more fashionable?" but he doesn't like to say it out. The polite reply, of course, is "Yes," and the axle is weakened in accordance with the fashionable mode. When the front axle of a light wagon is bent up, and the shafts are attached near the wheels, when the horse starts, especially if he does so suddenly, it has a tendency to turn the axle over and break the reach; whereas, if the axle were straight, or bent down a little, it would not act so. Again, as soon as the axle begins to "give down," if bent up, it gets longer and longer, and consequently tends to break the bed pieces. On the other hand, if originally straight or bent down, it tends to pull the frame together, especially if it touches the collar, as it should. Yet the majority of wagon makers seem to think the axle stronger if bent upwards, and, of course, most of the public follow the opinion of these; but who has ever seen a whiffle-tree pulled against the crook? W, V.

VARIOUS NOTES.

I Rise for Information.

WILL some one please tell me the value of a $40 phosphate on a soil receiving sufficient water to dissolve its soluble parts? Having that little matter settled, will the same or another person tell me the value of a $40 phosphate on a soil which receives only half enough water, and also upon one which receives no water. I have a faint suspicion that there is a money value in water, and the replies to the above will help to determine it. I read that all a soil needs to make it produce a crop is manure; I do not read anything upon the manner of applying it, or any suggestion that water *per se* is at all requisite. I read that old Ben Franklin, when he set sawdust pudding before his guest, was considerate enough to have it moist, and also provided water as a solvent, probably thinking that the joke would be *too* dry. Is it not the driest of jokes to inform us that we must apply $A^{50}P_{40}N_{30}W_{00}$, and never say "water" once, unless the last term in the above formula indicates that two negatives make an affirmative?

It seems as if we must trust to luck for water, and as "no water, no crop," so after all the chemicals, we depend upon luck for the crop. If that is the case, why go to the expense and trouble of applying any fertilizer? Here we come round to the starting point again. If water is so important, so absolutely, vitally necessary, why not at least hint in strong terms that to get back our $40 and our labor, and a little more as a profit, we must arrange some artificial mode of watering our chemicals, or we shall lose our labor and our pains?

How many farmers buy manure, meet with a dry season, lose faith and fall back into the old dry rut? Now the way out of all this is, to irrigate, on a small scale at first, and with the profits of the first year (which are as sure as taxes) enlarge, and ever after make money.

Destruction of Insects.

The salt question is always on the carpet, and while it is very certain that salt is not a manure, it is equally certain that its application is a decided benefit. The retardation and often complete ruin of crops by insect depredations is well known, but is not at all appreciated to its full extent. Salt can act in but three ways beneficially. It attracts moisture, and hence is useful in dry seasons: it drives away insects and, therefore, is useful in all seasons; and when thoroughly dissolved by heavy rains, it acts by assisting inert or insoluble material to become fit for plant food.

The first mode is a slight gain, not enough though to pay for the salt; the second is very valuable, paying for the salt and trouble of application from 10 to 100 times over, according to the prevalence and destructiveness of the insects; the third mode is of but little value because insolubles are generally proof against its feeble action. If we sum up the gain from the three modes of action, we perceive such a very decided gain, that one fair trial is sufficient to convince the most skeptical. The only danger is in an excess, but as five bushels per acre will do no harm, the danger is not likely ever to be alarming, as few farmers can afford to waste salt anywhere.

To Grow Morning Glories.

We have had the driest season this Summer ever known in Nebraska. It proves the axiom that "an attempt upon the life of a plant, prematurely forces it into flower and fruit." In the early Spring there was sufficient moisture to grow morning-glory vines quite well, but the intense drought since, acting as "an attempt on the life of the plants," has caused them to burst into an extraordinary abundance of blossoms, and of more brilliant colors than usual. The flowers are at the same time unusually large. Anyone can apply this principle artificially.

Another mode of producing the same result I have applied to Lima beans. When any vine is trained high on pole or string, it seldom flowers till it reaches the top and hangs down. This hanging down is an interruption of its natural mode of growth, *i.e.* an attempt upon its life. I train Lima beans to poles only four feet high, which they top in a short time, and at once burst into fruit. All vines which from their tenderness are liable to be caught by early frosts in the Fall, should be trained low and they will produce earlier and heavier.

Sour Soil or Sweet Soil?

I have growing a plant of rhubarb and a plant of Amber Sorghum close together. Both plants show their full characteristics—the rhubarb is very sour, and the sorghum is very sweet. I queried some time ago of the writers to the RURAL NEW-YORKER what sour soil was, as I had never seen any, but received no reply. Now I ask: What sort of soil is that in which both sour and sweet grow to perfection? That kind of soil out here which produces the common clover-leafed sorrel also grows sorghum, and produces catnip, horehound, sage, peppermint, and I can see no reason why, if protected by glass, with artificial heat, it would not grow oranges, lemons, and all tropical medicinal plants. Is not this "sour soil idea" only a relic of barbarism, or is it the relict herself, the wife of the old agricultural barbarian himself? It is certainly an old woman's notion, not worthy of enlightened farmers of the present day. S. RUFUS MASON.

Dodge Co., Neb.

Grasshoppers and Bird Pests.

A curious grasshopper visitation is to be noted as one of the peculiarities of the season. A section extending from the southern towns in this county through Cortland and into Broome, sixty miles in length and three to five wide, along the valley of the Tioughnioga River, was invaded by swarms of this locust pest. They are reported to have done serious injuries to all kinds of herbage and foliage.

Another singular development has taken place in this locality during the past season. In addition to the insects, larvæ and other pests that we have to fight, in order to save things that we depend upon for consumption or pleasure, we have the fruit-destroying birds to contend with. The birds in this city and its suburbs have attacked the grape crop with the most destructive effects. Many grape growers have lost almost their entire crops, and where the pests did not take all the fruit, they spoilt the remainder by picking the berries open. The maranders are the English sparrow, the robin and the oriole. The sparrows came into my grounds by the hundreds. We killed scores of them, with a good many robins and orioles, and finally drove them off. The oriole does not appear in this section in very great numbers, but he is the slyest thief of them all. The sparrow has become an unmitigated nuisance. I think some of them will get a dose next Winter, that will thin out the obnoxious swarms.

Freaks of Lightning.

I notice several accounts of the oddities of the electric fluid in the RURAL, but what occurred in this vicinity will be hardly matched. Early in August, a light shower passed over the city, nowise remarkable except for two tremendous peals of thunder. In one of them the lightning struck in the ground, in a low and level piece of meadow land belonging to me. As it penetrated into the earth the bolt seemed to break up into numbers of sparks, as some six or eight holes were made in a space of four to six feet square, the largest of which was three or four inches in diameter. I happened to be on the spot the next morning, and saw this for myself. People for fifty rods round were more or less affected by the shock. There were plenty of trees and buildings close by and a brick-yard within fifteen yards. "ONONDAGA."

Syracuse, N. Y.

AN INVITATION.—Col. F. D. Curtis writes us that the public are cordially invited to a "Pig Party" and farmers' pic-nic at Kirby Homestead, Charlton, Saratoga Co., N. Y., on Thursday, Oct. 7. No special invitation is needed. A lunch—and Mrs. Curtis is famous for her lunches—will be provided for those from a distance. Should it rain on Thursday, the party will meet next day.

COUNTRY AND CITY LIFE.

GEN. WM. H. NOBLE, OF BRIDGEPORT, CONN.

THE very name of RURAL NEW-YORKER bridges between town and country. By a mental "Rapid Transit," it takes us out of the rush and heat of busy mails, to the cool, and quiet, and delights of country life. There is a good deal in a name. To one wisely placed cling prestige and tender sentiment and heart memories, as to a torn and tattered battle flag. Such a one speaks a history of honored tradition, or a glorious purpose. I doubt a good deal whether "a rose by any other name would smell as sweet." There is more than its perfume floating on the air. It has stood for all that's lovely, gentle and refined, from Eden down. "RURAL NEW-YORKER" emblems and speaks for a close alliance of the best estate and life of town and country. No city airs or apeings are at home or wanted among the woods and fields or floods gladdened with fruit and flowers, and sheltering home trees swaying to the breeze, and golden harvests. Not polo games, or hops, the fox hunt or the race, nor the better life at spas or by the ocean's surge, promise the blood to cross with country life.

The city's need is rest, to think and gather

strength and nerve for the stir and head toil of the mart. The hope of country life is quickened brain and enterprise, born of the crush of men in crowds. To guide and commingle these streams of life is just the purpose for which "RURAL NEW-YORKER" stands an emblem and an utterance, its business and glory is to be in this a power.

To such a mission, the age and country offer wondrous helps. The life we lead, the air we breathe, the duties and empire resting on our country homes, have left on us but few markings of peasant life. The Yank don't play the peasant worth a cent. Besides, the rail and poney routes bearing to every hamlet, before sundown, the sun-up thoughts and doings of the world, the speaking fire that girts the land, the voice along the wires, and all that our better life avails, fast leave our peasant class in the dim distance as but a memory and a myth.

Yet if by peasant you mean the dwellers in rural homes, the tillers of the soil, we are in truth building up "the finest peasantry on earth." But to us the word no longer bears its import of old. It no longer means a rustic look or garb, no longer marks an humble reverence and bashful fear of those above in place, or wealth, or social chances. Our country dwellers of to day meet the situation. Self-government has educated the owners of the soil for their place and duty. Above all others in numbers and stake in the Republic, they step forward to bear up and defend this empire of the free.

To help them with brain and purpose, right methods in the field and homes, right thoughts and tastes is what the RURAL NEW-YORKER means. God speed the work!

WHAT OTHERS SAY.

KEEPING ONIONS.—A Minnesota writer says, in the N. Y. Sun, that he makes as deep a pit as he can with the plow for onions and cabbages in a dry, sheltered place near the house, scraping out all the loose dirt with a hoe, and putting in some chaff or straw from the straw stack, and tramping down well. Then he hauls the onions from where they grew and piles them in carefully on this, and puts more chaff on top and covers up with a foot of dirt from each side, and packs it smooth with the spade, where they can remain a part or all of the Winter, or until wanted. They were quoted at $1.25 last Winter and Spring in Minneapolis. If they freeze it will make no difference; they will come out all right when the frost leaves the ground. Cabbages may be pulled up on a dry day and packed in the other end of the pit, roots up, and also covered with straw and dirt, when they or the onions can be taken out as wanted. The cellar is one of the worst places to keep onions or cabbages in, as it is almost always too damp or warm.

A CORRESPONDENT of the Mark Lane Express says that he had opportunities of discussing with two experienced American farmers the price at which wheat can be produced in their country. One said that if the price should drop below 80 cents (3s. 4d.) per bushel at Chicago, the area of wheat-growing in the United States would soon begin to decrease. The other considered that a farmer in the States was paid if he received a dollar per bushel for his wheat, but that it would not answer to grow the crop for much less. He came from a district, too, where 35 bushels per acre are often produced, and where he has water carriage close to his farm.—Most farmers in the West would be willing to sell their wheat for considerably less year in and year out. It would be more satisfactory, however, if the sections were mentioned from which these farmers came.

"A DISCUSSION on the ear-marking of cattle took place at a meeting of the Bedale Chamber of Agriculture the other day," continues the same writer. "Dr. Brown, who read a paper on the subject, took up a curious position. He did not seem to object to the ear-marking of women, a species of mutilation which is a survival of savagery, and only a little more tolerable than ringing noses. At any rate, he held that if women choose to be mutilated it was no one's business but their own. When little girls are taken by their mothers to have their ears pierced, however, it is doubtful if they have much choice in the matter; and there seems to me to be more reason for the Society for the Prevention of Cruelty to Animals to interfere with these atrocities than with the ear-marking of cattle. The latter practice seems cruel; but Dr. Brown did not succeed in showing how all cattle could be permanently marked in any way which would cause less suffering. Branding on the hoofs is absurd; for, as some one remarked at the meeting, it would often be necessary to wash the animals' feet to find the marks. As to branding on the horns, that answers very well with cattle which have horns, but cannot be carried out with very young animals or with polled cattle. Cannot some one invent a little machine that would quickly clip a letter or figure down to the roots of the hair? The question of ear-marking, however, applies chiefly to sheep. According to Dr. Brown, ringing pigs' noses is excusable, while docking lambs' tails is inexcusable. Why? Both operations are performed because it answers the purpose of those who keep the animals to have them done, and the pig-ringing inflicts ten times as much suffering at the time as the lamb-docking does, besides being a perpetual source of discomfort afterwards. No, Dr. Brown, these nice distinctions "will not wash." If cattle and sheep are to be protected, it will be only fair to stand up also for girls and pigs.

IT is unfortunately impossible to get accurate statistics of the number of Short-horns on the continent of America, a writer in the London Agricultural Gazette remarks. It may be stated, however, that herds are met in every direction, and that at one sale alone this Autumn 300 head were sold in four days. It seemed to him that the Short-horn is destined to play a most important part in the agriculture of America. It seems to be the cosmopolitan of the various breeds of cattle. It thrives all over, and wherever cattle are known there it will be found. Its rapid maturing powers will give it the preference over all other breeds.

THICK AND THIN SEEDING.—The following letter was read before the Farmers' Club at a late meeting. We take the letter and the subsequent discussion from the Husbandman of Elmira, (N. Y.)

"I have learned of an instance of thin seeding with oats, the results of which I think are worth reporting. Mr. H. C. Whitewood of Canisteo, N. Y., sowed last Spring upon five acres of measured ground, two and a half bushels of oats, or two pecks per acre, and harvested and thrashed from the said five acres 355 bushels of oats, or 71 bushels per acre. The ground was a very rich piece of black mucky soil that had been marshy and covered with alders. The water had nearly disappeared and last fall Mr. Whitewood pulled up the alders and plowed the ground; he was more anxious to get the land seeded to grass than to raise a crop of oats, and sowed the oats more to protect the young grass plants than for any other purpose. The catch of grass is a decided success. About three years ago Mr. Whitewood cleared a similar piece of land, plowed and sowed to grass, sowing three pecks of oats to the acre and harvested over 50 bushels per acre. He says that the oats in this case were so thick that in many places the grass was smothered. I obtained the above statement from Mr. Whitewood in person. He is perfectly reliable and there is not the least doubt about it I am fully satisfied.—Charles Whiting."

W. A. ARMSTRONG remarked that the Club might accept the report as true, and it supports in a very striking manner the propositions made there regarding thin seeding. The ground was good, so each single plant reached out and spread by tillering until the space was occupied.

J. S. VAN DUZER said that there must be one practical good resulting from this discussion of seeding—that farmers will consider with more care the preparation of their land for the seed. Thorough fitting is stipulated by the advocates of thin seeding as the first necessity. This should not be misunderstood; yet there will be thin seeding on poor land, farmers will overlook the important requirement so often mentioned here—complete preparation—they will scant the seeding and be disappointed. He was satisfied that rich land does not require so much seed as poor land, whether the crop be wheat, barley or oats; but he was not sure that a reduction in the amount of seed commonly used, without corresponding advantage in better preparation, would result in profit.

J. BRIDGMAN.—In the Spring of 1879, I begun sowing oats at the rate of two bushels to the acre. After drilling a portion of the field I added a peck, and after proceeding over a considerable strip farther I set the drill for still another peck, making two and a half bushels to the acre, with the purpose of noting what difference might appear in the yield. As the result of my observations, I came to the conclusion that two and a half bushels were about right, and I sowed that amount to the acre last Spring. The crop was 70 bushels to the acre, and I think it would have been less if I had sowed less seed.

W. A. ARMSTRONG.—Yet we have a greater yield reported from two pecks of seed.

J. BRIDGMAN said it was true, and he thought the statement worthy of belief, for he has some knowledge of Mr. Whiting whose name appears with the report, and he must say that he is a gentleman whose word is good. He tells a remarkable story, but it must be credited.

G. W. HOFFMAN last Spring sowed oats at the rate of one and a half bushel to the acre and the crop lodged, long before it was time for it to ripen, so he cut it for fodder. The land was good; it had been in beets and as a preparation had been manured. The oats were as thick as he wants to have them in any season, and it is probable that the thick growth caused them to lodge. On gravelly land two bushels of seed to the acre may be required, but he would never go beyond that. He has said that land not capable of yielding a full crop of wheat from five pecks of seed to the acre is not fit for wheat, and that is still his judgment.

THE Germantown Telegraph, the editor of which has made fruits a careful study, has somewhat revised his list of favorites. It is now as follows:

STANDARD PEARS.

1. Giffard,	10. Belle Lucrative,
2. Doyenne d'Ete,	11. Manning's Elizabeth,
3. Early Catharine,	12. Seckel,
4. Kirtland,	13. Howell.
5. Bloodgood,	14. Anjou,
6. Summer Julienne,	15. Sheldon,
7. Tyson,	16. St. Ghislain,
8. Brandywine,	17. Lawrence,
9. Bartlett,	18. Reading.

In the above list, from No. 1 to 8 are Summer varieties: from 9 to 16 Autumn (early and late); and 17 and 18 Winter, thus affording a sufficient number for each of the periods, of the best known sorts for this region.

APPLES.

1. Malden's Blush,	7. Cornell's Fancy,
2. Baldwin,	8. Red Astrachan,
3. Smokehouse,	9. Wagener,
4. Northern Spy,	10. Porter,
5. Smith's Cider,	11. Gravenstein,
6. Fallawater,	12. Tompkin's Co. King,

13. Roxbury Russet.

PEACHES.

1. Crawford's Early,	5. Crawford's Late,
2. Hale's Early,	6. Ward's Late,
3. York's Early,	7. Smock's Late,
4. Old Mixon,	8. Susquehanna.

GRAPES.

1. Telegraph,	4. Clinton,
2. Concord,	5. Salem,

BRIEFLETS.

THE Chicago Fat Stock Show will be Nov. 15th—20th. . . . . People who believe in homœopathy, instead of whipping their children very hard when they do wrong, should give them just a single, gentlest of taps. . . . . According to M. Chevreul, one of the greatest advantages of draining is to insure the free access of atmospheric oxygen. A plant cannot live without oxygen any more than an animal. Even the roots cannot perform their duties in a soil insufficiently aerated. Hence the importance of stirring the soil when it is compact. . . . . Gather squashes, beets, mangels and carrots. . . . . It is well to leave apples in shallow heaps, as they are gathered in the orchard for a day or so if the weather is fair. . . . . It is a good plan to give fruit trees a wash of lime, powdered aloes and soot at this time or a little later. Mice and rabbits are less liable to gnaw the bark. The plan of making a mound of earth about newly transplanted trees, "so as to give support to the stems" is, we think, a useless if not a bad one. It makes the bark tender and induces buds to push in the Spring. Besides, these little mounds really give no support. The earth yields to the swaying of the stem, leaving spaces which in Winter hold water or ice. . . . . Grape vines may be advantageously pruned as soon as the leaves begin to fall. . . . . The maximum of comfort and the minimum of expense should be the farmer's motto. . . . . Sweet potatoes should not be dug until after the first frost. Then it is well to leave them for several days, covering them at night, if frost is feared—with the vines. Sweet potatoes, to keep well, need a temperature over 40 deg. They should be placed on shelves in single layers and exposed to free currents of air.

CATALOGUES, ETC., RECEIVED.

FOURTH ANNUAL CATALOGUE OF THE AGRICULTURAL AND MECHANICAL COLLEGE OF TEXAS, FOR 1879–'80.—Like the other agricultural colleges, this promising young institution owes it origin to the Congressional Morrill Bill passed in 1862, donating public lands to the several States and Territories which should provide colleges for the benefit of Agriculture and the Mechanic Arts. On Nov. 1, 1866, the Legislature of Texas formally accepted the provisions of the Congressional Act, and the State received from the General Government scrip for 180,000 acres of public land, the proceeds of which constitute the present permanent endowment of the College. In 1871 the Legislature began to fulfill its obligations by the construction of suitable buildings for which $202,000 were appropriated, and the county of Brazos secured the location of the college by a donation of the college farm—a tract of 2,416 acres. Finally on Oct. 4th, 1876, the college was opened. In the present session there are, we notice, 144 students. From the report of President, John G. James, we gather that until his incumbency, less than a year ago, Agriculture and the Mechanic Arts, for the benefit of which the institution was founded, were not only neglected, but that "the college had sedulously cultivated a sentiment antagonistic to the development of these branches of study and which continually decried them." Under the present management there seems a strong probability that the object for which the institution was founded, will honestly receive a fair share of attention,—an example of reformation that should be followed in the management of more than one other falsely styled agricultural college.

THE ILLINOIS INDUSTRIAL UNIVERSITY has now 15 Professors—two chairs being vacant. There are ten Professors of the Industrial Arts and Natural Sciences. These have seven assistants. There are three Professors of Languages and Literature—one of Ancient, one of Modern and one of English. These have one assistant. There are distinct Professorships of Agriculture, Horticulture, Veterinary Science, Agricultural Chemistry, Architecture, Civil Engineering and of Mechanical Engineering.

Of the 317 young men in attendance last year, 170 were in the industrial or Natural Science courses, 100 in the Literature and Science courses, with 47 Elective, or Preliminary.

Subdividing this classification, there were in Agriculture, 27; Architecture, 12; Civil Engineering, 33; Mechanical Engineering, 37; Chemical course, 47; Natural History course, 14; English and Modern Languages, 89; Ancient Languages, 11. Each student is required to have at least one study each term, selected from a prescribed list relating to Agriculture and the Mechanic Arts. Aside from this, choice of studies is allowed.

WHEAT CULTURE.—How to Double the Yield and Increase the Profits, by D. L. Curtiss. This is a small, paper-bound pamphlet of 72 pages, 12 mo., which is a compendium of what is at present known on the subject of which it treats. Price 50 cents. Published by the Orange Judd Company, 245 Broadway, N. Y.

PREMIUM LIST of the State Agricultural and Mechanical Society for the 13th Annual Fair to be held at Columbia, S. C., November 9th and 12th. Thos. W. Holloway—Pomaria, Secretary.

J. T. LOVETT, Little Silver, N. Jersey—Catalogue of the Monmouth Nurseries, Strawberries, Raspberries, Blackberries, Gooseberries, Currants, Grapes, Cranberries—also fruit trees.

BOWKER FERTILIZING COMPANY, 81 Exchange Street, Rochester; 3 Park Row, New York, and 43 Chatham Street, Boston. Bowker's Grain Phosphate Circular.

CIRCULAR NO. 70.—Illinois Crop Prospects. Consolidation of Reports returned to the Department of Agriculture, Aug. 2, 1880.

Everywhere.

BEYOND THE MISSISSIPPI.

JUST as I was trying to collect my scattered thoughts, and bring them into readable form, my tympanum was assailed by an ominous grunt; and as visions of a devastated cabbage patch danced through my excited brain, I sprang up from my study chair, catching a *towel* that hung near wherewith to cover my auburn locks, and rushed frantically to the fray. By dint of the exercise of lung and limb, and with the help of Nick—not *Old Nick*—the garden was soon cleared of intruders, the hole in the picket fence patched as none but a woman can do it, and once more I was seated ready to enjoy the glory that belongs to the conqueror. This is some of the variety that is said to be the "spice of life," but for my part I am willing to dispense with condiments, and live on plainer fare.

But some reader is saying, "What has this to do with life 'Beyond the Mississippi?'" A great deal, I assure you. It is the frequent experience of thousands that are living in the West, and who are but just making a beginning. They have purchased either a tract of wild land, having all the fencing to make, or are trying to bring some old, neglected, half-fenced, and poorly improved farm, into a better condition. In either case the fences are insufficient to protect the growing crops. There is work enough for three, and only one man to do it, and in undertaking too much, his strength fails, sickness follows, and as other evils in their turn are heaped upon him, he

despairingly turns his face toward the old homestead. He has lost all desire to remain in a locality which has brought to him only vexation and disappointment. What wonder, then, that the little farm is sold for less than the cost of the improvements, that the few articles of furniture are packed in a covered wagon, and the family turn their faces eastward. "Going back to see my wife's people," is the reply of nine out of ten of the eastward-bound emigrants. They are sick, discouraged, yet hoping for better times that never come, and they wend their way back to their old native hills and valleys, perhaps to fare no better. But if poverty and disappointment should still be theirs, yet it is with old friends and familiar scenes around them, and the graves of their loved ones near.

The vast number of emigrant wagons that line the roads with their white covers, is almost beyond belief. Some are well equipped for the trip, and "Go West" rejoicing. Alas! that so many should return, sorrowing! Nearly all who travel westward through this section at present are bound for Southwestern Missouri. Last Spring the great movement was towards Kansas, and the greater part of them are going back now, and most especially those who went to Western Kansas. The great complaint seems to be "want of water," and the prevalence of hot, scorching winds which dry up all vegetation, and literally blow the wheat ont of the ground. The first time I was told this, I was extremely incredulous, and I ventured to inquire: "Might it not be a canard?" but it has been corroborated by hundreds of others. Though seemingly incredible, yet as they relate it, it is not impossible. What a Missourian would consider an extremely high wind, the Kansas citizen can enjoy all the time, with an occasional gale thrown in by way of variety, and a cyclone or two, when the inhabitants need a new sensation. Their land is very sandy, and the continuous winds blow the sand away from the roots of the wheat plants, until they are entirely bare. It is the last straw that breaks the camel's back, and so it continues to blow and blow and blow, until the poor wheat finally succumbs plant by plant, until the places that once knew them know them no more.

We, too, have dry weather, hot suns, an occasional cyclone, the potato beetle, the chinch bug, snakes and the curculio; but we never have had the "army worm," nor has our wheat ever been blown to "kingdom come," roots, stalk and head. Our railroads have never been compelled, through fear of having their tracks demolished, to carry a starving population out of the State *gratis*. This has been done in Kansas. Eastern Kansas is doing better, though emigrants report drought there also. That that great State has great resources, and that it has a prosperous future before it, I do not deny. But to succeed there, a man should have money enough to carry him through while he weathers the gale. Emigrants certainly make a great mistake in passing the fertile and beautiful prairies of Illinois and Iowa, and the well wooded and finely watered lands of Missouri, with its inexhaustible mines of coal and a whole mountain of iron, its Normal schools, its numerous railroads that cross the State in every direction, in fact, a State that has within itself an independent support for all its inhabitants; that only needs the skilled hand of the mechanic and artizan to bring forth and develop its vast wealth; emigrants, I repeat, make a mistake in passing by these for other and less desirable locations. But now the tide seems to have turned, and is flowing in our favor.

Crops in the river counties of Missouri have all turned out well, as far as I have reports, though in this section corn will be light owing to a very dry and hot July and August. There was rain as often as every two weeks, and sometimes more frequently; but the hot sun blistered every green thing. The celebrated "Oldest Inhabitant" never before experienced such a hot Summer. The ground was so hot that a person could not hold his hands on it without experiencing a burning sensation. No wonder that the corn dried up and turned yellow, and the grass turned brown: but the first cool days and refreshing rains of September changed all this, and the earth rejoices in a carpet of lovely green. Wheat is a good crop, and on all sides you see the carriers piling up the golden straw, and hear the short, shrill toot-toot of the engine that occupies the place of the ten horses that of yore furnished the power that separated the wheat from the chaff. The steam-thrashers hereabouts hurry the work so rapidly that they fail to do it well. Complaints are numerous of wheat being wasted, and one farmer near here says his wheat is badly cracked, averaging a peck of cracked wheat to every two bushels. "The more haste, the less speed," and "Haste makes waste," are two maxims which it would be well for them to observe.

The fruit crop is immense. Peaches are plentiful at 50 cents a bushel, though very fine named varieties being $1.50. The Heath is the most sought for, though there are a great many sold under that name that never had a right to claim the remotest kinship to the Heath. Grapes are abundant, though there are but few on the market, as they are manufactured into wine. The owners of vineyards, as a rule, do their own manufacturing, and consume a large share of their own product. Wine is plentiful at 75 cents a gallon. The population is largely German, and, of course, wine, beer, Bologna sausage, and Limburger cheese find a quick sale. The county seat contains, or claims, 7,000 inhabitants, and nearly all the stores, shops, saloons, restaurants, drug-stores, etc., are kept open Sunday forenoons. A person can buy anything on Sunday, about as easily as on any other day. Nearly every Sunday since warm weather commenced, there has been an excursion from the county seat to the chalybeate springs, about twelve miles out of town. I am told that dancing, billiards, croquet, horse-racing and kindred amusements are the order of the day.

Farmers in this vicinity are just on the eve of wheat sowing, and the wise ones are postponing it as long as possible to prevent the ravages of the Hessian fly, which is said to injure especially early-sown wheat. The ground is in splendid condition and pulverizes well. The dry weather prevented most farmers from plowing the ground twice.

Just now the "Young American" is reveling in the delicious flavor of paw-paws and persimmons, and his pockets vainly endeavor to rival his stomach in plethora, while mothers are anxiously replenishing their bottles of paregoric, and stores of hops, hoping thereby to alleviate the pains of insulted and overburdened nature.

The mocking birds and bobolinks are feasting on the luscious sweetness that awaits them, growing fat and clumsy, and forgetting their songs in their gormandizing, preparatory to their flight homeward.

But what can be finer than this glorious September weather? The days are perfect. The nights over whose darkness the twinkling stars shed their radiance, are cool and refreshing, soothing the weary toiler to quiet slumber. A few slight frosts have cleared the atmosphere of all malaria, and all nature rejoices in the pleasure of existence.

Adair Co., Mo. BESSIE VICTOR.

RURAL SPECIAL REPORTS.

GA., Washington, Wilkes Co., Sept. 20.—Cotton is being picked, ginned and marketed very quickly hereabouts. In a late article in the RURAL it was said that hitherto cotton seed had to be planted by hand, as the adherent lint prevented its uniform deposition. Thousands of cotton planters, however, are now used in the South. In this section three patented planters are successfully used in planting the crop. J. C. L.

IOWA, McGregor, Co., Clayton, Sept. 23.—Wheat at thrashing time is turning out a very poor yield per acre—from three to ten bushels generally. A couple of days ago I got from the mill 133 pounds of flour from four bushels of wheat, or 44⅓ pounds per bushel. A good deal of sorghum has been raised in this township and two or three mills are working it up into molasses and sirup; they are not yet prepared to make sugar; but they make a fine golden sirup. The owner of one of the mills tells me he is making 100 gallons every 24 hours. All the mills are running night and day, each having two sets of hands. The juice runs from the press first into a large pan where it is heated to the boiling point; then let off by means of a cock into two settling pans where it stands to settle a while. Next it passes into the main boiling pan where it boils, being constantly skimmed until it becomes thick enough for the finishing pan. There it is again constantly skimmed until it is considered thick enough, when it is let off into the cooling pan where it stands until it is cool enough to be put up in kegs or barrels. J. R. J.

KANSAS, Harlan, Smith Co., Sept. 14.—Away out on these Western prairies we are trying to build up a home. The past year has been discouraging, on account of the severe drought; but we are still hopeful, for we have had rains again, and we cannot think the Lord took pains to make this country so fertile and beautiful, without intending it to be settled up. The wild plants of this country are, most of them, very different from those that grow in the East. Many of them are of exquisite beauty, and a few are adapted to, and are well worthy of general cultivation. The Sensitive Rose is a favorite with everyone here. It is a perennial trailing plant with delicate, pinnate leaves. The leaflets shrink from the touch as if endowed with sensation. They also fold up at night, as if for sleep. The flowers are numerous, are delightfully fragrant, and resemble silk tassels of pink and gold. There are two kinds of cactus—curious and unique in form, bearing strange and beautiful blossoms.

L. B. H.

KANSAS, Council Grove, Morris Co., Sept. 20.—It is very dry here. This is thought to have been the driest year since that year when the grasshoppers devastated Kansas. This is a nice section, and, in spite of everything, I think a fair crop of corn will be raised here.

J. H.

OHIO, University Farm, Columbus, Franklin Co.—We have had almost a perfect season for corn, which is now being harvested. Wheat was a fair crop, over a large acreage. Less will be sown and more of that after corn, this Fall, consequently next year's crop will probably be smaller. Potatoes are a good yield; but we do not raise enough for the home market. Fruit of all kinds is and has been very abundant. Our demand for northern apples will be very light this winter. Business brisk, manufacturers far behind orders, and everybody happy—except professional croakers.

C. E. T.

OHIO, Little Hocking, Washington Co., September 18.—Wheat in this region was only fair; corn is good; early potatoes are a partial failure, late ones promise well. Very few oats were raised, and but little sorghum. Fruit is so plentiful that it is a drug in the market; thousands of bushels are being dried in patent evaporators—price twenty cents per bushel delivered. Farmers in the Ohio Valley are largely engaged in raising potatoes, many of them planting 100 acres, and as a natural consequence we are all striving to get the best, so send along your White Elephant. A. L. C.

OREGON, Canby, Clackamas Co., Sept. 12.—Grains of all kinds are good here. Wheat was a good yield but brings a low price. Oats and barley are fair. The weather for harvesting crops has been unusually good; but advices from Great Britain indicate that low prices will rule for this season at least. Fruits of all kinds are scarce and high, dried apples selling at 12½ cts, per pound, plums as high as 20 cts. The apple crop is a failure in this part of the State. Potatoes are scarce and high, selling readily at 60 cts. per bush. Onions, one and one-half cents per pound. What Oregon wants is a European immigration in place of the hordes of Chinese coolies that swarm to these shores. The Pacific Slope will be the tail of the Union kite until the Burlingame Treaty is abrogated.

J. S.

TEXAS, College Station, Brazos Co., Sept. 23.—Corn and cotton are the main crops in this section of the country. The former will yield only a medium crop, mainly for lack of cultivation. In passing through the country, nearly every corn field one sees is covered knee-deep with a dense growth of grass and weeds. The cotton has suffered severely by the ravages of the cotton worm, but, in spite of this, the crop will be good. Picking is now going on, and laborers are scarce. Planters pay 75c. per 100 pounds, and a good picker can pick 300 pounds a day. At this season the whole colored population, men, women and children, resort to the cotton fields, and those who do not divide their earnings with the bar-keepers, or in other ways spend their money foolishly, can earn almost enough to keep them till next cotton-picking season. Generally the land is rich. In the bottom lands of the Brazos River cotton grows as tall as a man on horseback. Late equinoctial rains have retarded picking and damaged the crop to some extent. Apples will not succeed here, but grapes, peaches and pears grow and fruit luxuriantly. C. C. G.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

The European Cabbage Worm.

W. S., Syracuse, N. Y., asks what sort of a worm is the European Cabbage Worm; is it the worm that bores through the head of the cabbage and cauliflower and which has caused so much loss thereabouts the past season.

ANS.—The European Cabbage Worm—Pieris rapæ—was first introduced from Europe into Canada in 1857, since which time it has spread widely over the Eastern, Middle, and some of Southern and Western States. The caterpillar or worm is of a pale-green color, finely dotted with black, with a yellowish stripe lengthwise along the back, and with a yellow stripe formed of small yellow spots along each side. When full-grown it is from three-quarters of an inch to an inch long. The worms may be found from April to October, of all ages, feeding on leaves of cabbages, mignonette, stock, nasturtiums and other members of the cabbage or mustard family. They are supposed to have four or five generations in the course of a year, the last generation passing the Winter in the condition of crysillds. In the butterfly form, this pest is of a white color with a black dash at the top of the fore-wings and a black spot on the front edge of the hind-wings above, with two black spots on the underside of the fore-wings. Besides these spots, the male has one in the middle of the fore-wings above, and the female has two. The Spring butterflies are much whiter than those produced later in the season, and sometimes lack some of the black spots. Occasionally light yellow males are found, but hardly ever yellow females. From the above description of this pest, our friend can easily decide whether the insect that has troubled him is the European Cabbage Worm.

Cleansing Amber-Cane Juice.

A. A. H., Corry, Pa., asks how to cleanse the juice of Amber-Cane so as to make a good sirup.

ANS.—As the juice comes from the crusher strain it to remove the coarser matter. Have a pan made with galvanized iron bottom and wooden sides to hold 100 gallons, placed on an arch; heat the juice to 180 deg. Fah., and add five pints of cream of lime, stirring it in thoroughly, and remove the fire—do not let it boil. Remove the scum from the top, and when it settles or coagulates, draw it off with a swing pipe or siphon. The sediment can be strained through a coarse bag. When this clear liquor cools to, say, 110 deg. Fah., some preparation should be added to neutralize the lime. F. L. Stewart of Murraysville, Pa., puts up a powder which is probably as good as anything that could be got at once. There is, however, an aluminous jelly being used quite extensively at present. This is made from porous alum and sal. soda. A quantity of the alum is placed in a tub of water and a similar quantity of the soda in another tub of water—six pounds of each. After they are dissolved, enough of the soda water is added to the alum water until effervescence ceases, then a jelly forms in the bottom. The water is dipped off and the jelly used to destroy the excess of lime. After this, boil down as fast as possible to a sirup.

Queries about Peach Trees.

G. H. Bozzardsville, Pa., says he has a peach orchard of 700 trees planted three years ago last Spring, 21 feet apart, and he asks, 1, would it be advisable to plant as many more trees next Spring on the same ground between those now growing; 2, would the borer be likely to be more troublesome on these trees than on those planted at a distance from a peach orchard; 3, which are the better—peach trees brought from a warmer or a colder climate.

ANS.—Peach trees are usually planted about 20 feet apart. They are then allowed to grow as they will. If cut back every year or so—as it is well to do—perhaps 15 feet would be a sufficient distance. The plum stock dwarfs the peach somewhat so that thus worked and cut back the trees might be set as close as every 10 feet. In your case we should not recommend that you set trees between those already growing. 2. Not necessarily. The trunks should be washed in Spring and Midsummer with lime, potash, &c. 3. If there be any choice, we should prefer the colder climate. Other queries will be answered in due time.

Miscellaneous.

T. H. B., Windsor, Ohio, asks, 1, what is the value of road dust as a fertilizer; 2, is bone that has been softened by remaining in wood ashes as good a fertilizer as ground bone.

ANS.—1. This question can hardly be answered definitely; for the value of the road dust will depend upon the nature of the soil, the amount of travel over the road and of foreign fertilizing material consequently mingled with the dust. 2. Yes.

A. N. L., East Orrington, Me., sends for name a plant which is becoming a serious pest in meadows thereabouts. Its root resembles a parsnip both in appearance and odor, but it is only about six inches long, and scarcely three-quarters of an inch in diameter.

ANS.—Daucus Carota, Wild Carrot. This is becoming more and more a vile pest. It is a biennial plant and might be exterminated by persistent mowing.

L. B. H., Harlan, Kan., asks why shouldn't RURAL subscribers exchange seeds and plants through means of our columns.

ANS.—For the first year after the paper came under the present management there was a special Exchange Department for this very purpose; but it was abused in so many ways, that it was thought advisable to discontinue it.

W., Morehead, Kansas, asks whether we could sell a bushel of Blount's White Prolific Corn.

ANS.—No. We sell absolutely nothing but the RURAL. The sale of this corn has been advertised in our columns by several seedsmen, and doubtless will be again before seeding time.

P. D. G., Lancaster, Ky., asks where seed of the old Mediterranean bearded wheat can be obtained.

ANS.—From B. K. Bliss & Co., 34 Barclay Street.

ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, OCT. 9, 1880.

SILVER CHAFF WHEAT.—We have now thrashed our Silver Chaff wheat. This it will be remembered was of all kinds that most injured by the Army Worm. It was upon this plot that our chickens were turned which, while feasting upon the worms, destroyed also a good deal of the wheat. The yield of two plots of Silver Chaff—together less than two-thirds of an acre—was but ten bushels. Nevertheless our own impression is that under the same favorable conditions, it would have yielded more grain than any of the others. Acting upon this we have sown Silver Chaff instead of Clawson which for six years had been our choice, as it is at the present time that of three-quarters of the farmers of Long Island. We regret that the press of our own farm work did not enable us to commend this wheat to our readers earlier in the season.

THE APPLE CROP.—This is unprecedentedly large this season, and thousands of bushels of the early crop are said to be rotting on the ground at the West, as they are not paying there even as stock-feed, or to be made into cider. If properly gathered, packed, and shipped, the larger sizes of fair, smooth Winter fruit, may find a good market abroad. The English Magazine of Pharmacy says, if a soft kind of tissue paper is soaked in a solution of salicylic acid, and dried before it is used, and each apple be enveloped in three or four folds of this, and precaution be taken to prevent the bruising of the fruit in gathering, storing, packing and shipping, the salicylicated tissue paper envelopes assist much in preserving the fruit and retaining its fresh, aromatic taste. This tissue paper is very cheap, and the method of preparing it is very simple. It has only to be dipped once in the solution and then dried.

DRILL BROADCASTING WHEAT.

AT the solicitation of one of our implement friends, we were induced to try a set—or rather part of a set—of drill tubes so constructed as to sow wheat broadcast. The tube is spread out at the lower end V-like, while a round center piece and a wire are so fixed as to scatter the seed as it falls. This it does with more evenness than it could possibly be sown by hand, while the seed is deposited as deep as need be and well-covered. Five of those tubes were put in the place of the ordinary tubes, leaving four of these. Thus, it may be seen, ten of the broadcast and eight of the old tube drills would alternate in the field. Thus far we are only enabled to note that the seeds sown by the old tubes were the first to germinate. The theory of the broadcast drills seems to us a very reasonable one. It seems to combine the advantages of both drill and broadcast sowing. Our test has been upon a four-acre field, and we shall in due time report results.

ANOTHER OLEOMARGARINE FRAUD.

FOR a considerable time the conviction has been inevitable here among dealers in butter and others interested in honest transactions in agricultural products, that a large amount of oleomargarine was annually exported under the name of butter. Every day the stuff is fraudently sold in hundreds of stores in this and other cities under this name; and it was only natural to suppose that those who, reckless of exposure and punishment, barefacedly perpetrated this fraud upon their fellow-citizens would not hesitate to repeat the swindle in foreign markets in which their cheating would subject them neither to disgrace nor chastisement. Investigation has fully confirmed this supposition, and lately President Parker, of the Produce Exchange, in behalf of the butter dealers of this city, and indirectly of the dealers and producers of butter all over the country, wrote to Secretary Sherman complaining of the lack of discrimination between butter and oleomargarine in the statistics of exports from this port.

In reply to this letter, Mr. Joseph Nimmo, Jr., Chief of the Bureau of Statistics of the Treasury Department, writes that the statistics of domestic exports *now* give the quantities and values of butter separately from those of oleomargarine, and that the acknowledged exports from the port of New York during the year ending June 30, 1880, amounted to 31,061,610 pounds of butter, valued at $5,179,071; and 19,833,320 pounds of oleomargarine worth $2,581,317. These figures make the butter average only about 16⅔ cents per pound, and the oleomargarine a trifle over 13 cents. Even this margin, however, is amply sufficient to induce such unscrupulous men as some of the oleomargarine dealers, to ship their concoction as butter, so as to get butter prices for it.

The law under which our export statistics are at present obtained give ample opportunities for such fraudulent transactions, inasmuch, as they merely require that the "manifests" of the exports shall be sworn to, before a clearance shall be granted for a foreign port, without providing for any examination of the merchandise to verify the correctness of the representations made in the manifest. Accordingly, the difficulty in obtaining the correct statistics of the exports of these two products—one of the dairy and the other of the shambles—lies not in any culpable carelessness in the Customs officers, but in the fraudulent description of oleomargarine as butter in the sworn manifests. To remedy this defect, it should be provided that wherever any doubt exists of the character of goods exported, they should be examined by experts before shipment, just as, under like circumstances imports are frequently examined to prevent impositions upon the revenue.

THE GREATEST YIELD OF INDIAN CORN ON RECORD,

Produced under Inexpensive Cultivation, without Farm Manure! (?)

OVER 150 BUSHELS OF BLOUNT'S CORN (SHELLED) TO THE ACRE!

No less than 300 bushels of Chester Co., Mammoth Corn (ears) per acre!

(The following dispatch from the RURAL FARM comes to us as we go to press. Eds.)

RURAL FARM, Oct., 2nd, 1880.

We were prepared for a great yield of Chester and Blount. But the yield is so remarkable that we shall not ask our readers to accept our statements alone, but shall have them examined and corrobated by well known agriculturists whose testimony cannot be doubted. The Chester Co. *must* yield, from estimates thus far made, not less than 300 bushels of corn in the ear to the acre. We have hopes it may yield as high as 325 bushels. The Blount, judging from what we have already measured, will yield over 150 bushels of shelled corn per acre. Readers will bear in mind that these estimates are not based upon the product of small plots which have been richly manured and carefully tended. We speak only of the yield per acre. The field upon which the Blount corn has been raised, has received no farm manure in seven years. It had been mown and in pasture during that time. The sod was plowed under in early Winter and and this Spring was thoroughly harrowed and rolled. The corn was drilled in twelve to fifteen inches apart, the drills four feet three inches apart. One dressing of concentrated corn fertilizer at the rate of 300 pounds to the acre, was given previous to the last harrowing. When the corn was several inches high, it received another application of the same fertilizer, at the rate of 100 pounds per acre, and when eighteen inches to two feet high, another of 100 pounds of concentrated potato manure. The field was cultivated four times—twice with cultivator, twice with hoe—always flat, all hilling up whatever having been carefully avoided.

The field under Chester we have always considered the poorest of the farm. It had not been cultivated in fourteen years. The sod over a portion was quite worn-out and the soil, which is gravelly, was as hard as a brick-bat. This was plowed and only 300 pounds per acre of corn fertilizer sown (all in one sowing), no farm manure of any kind being used. Like the field under Blount, it was thoroughly harrowed and rolled, the seed drilled in, the drills *three and a-half* feet apart. It was cultivated the same as the Blount field in all respects. Whether the Blount or Chester will yield the more *shelled* corn has not yet been determined. RURAL readers, when all the facts of this immense yield are presented, may judge for themselves to what it is due. It is apparent that it is *not* due to rich soil or high manuring. The kinds of corn, method of planting, and cultivating, alone remain to be considered.

THE RAILROAD POWER.

THE West has a vital interest in the strict guarding of the growth of the great railroad power of the nation. To curb or restrain that power there are two methods which may be used. The first is to enable the country to become as far as possible independent of these growing institutions of wealth and power, and second to create such a competition as will regulate traffic to some extent in the interest of those having goods to be transported. In the last instance the railroads become a great middle power, living out of the profits between the producer and consumer no less than before, although their profits may be diminished.

In the first instance, so far as each section may become self-contained and independent, so far may the profits be kept at home, or not paid to a power living upon producer and consumer, but producing nothing and consuming but little.

And here the whole question of railroads is opened. There is no doubt of the benefit of the railroads, both to the far-apart sections of a country, and to the morelocal traffic. But the prosperity of a railroad is in the necessity one locality has for the products of another, and of each for the markets of distant sections.

Did each section produce all it consumed, it would pay no profits to railroads. Did each section consume all it produced, it would not be obliged to search for markets abroad. The question then arises, does each section so produce and consume as far as is practicable? We think not, as is illustrated all the time in the growing of new manufactories all over the interior, rendering the transportation of raw material and provisions to the seaboard less and less necessary, and also causing less demand for the return of manufactures.

It is steadily becoming more and more aparent that it is better to move the machinery and the consumer to the raw material and the provisions, and to export the surplus manufactures, than to carry the raw material and provisions to the machinery and consumer and then return the product. So far as this economy is practised so far the country is independent of railroad traffic.

Whether it is for the interest of the nation to create and support a gigantic railway system of long transportation, for the sake of the division of labor, and the greater number of consumers thus provided, with the market for iron and mechanical labor thus afforded, is for the public to decide, but that decision will no doubt be in favor of the greatest economy to each section. Did the East raise its provisions, and did the West use up its raw material of various kinds and in so doing make its manufactures and consume a large portion of its provisions, the dependence upon railroads would be reduced to a minimum, and this is the influence gradually but steadily at work threatening the supremacy of the railroad power which would otherwise amount to a monopoly.

A THREATENED HORSE DISTEMPER.

IT depends very much upon the condition of the season, whether we shall be discommoded by a prevalent epizootic among our horses. Indications that an outbreak of this kind is immiment are already appearing in this city where upwards of 4,000 horses are now sick. The distemper has also appeared in Boston and in other cities, and some rural districts. There is little doubt that this disease, a true influenza, is malarial; or what is understood by that term. It is epizootic because the conditions which produce it are prevalent and affect all those animals whose systems are prepared for it by a previously enfeebled or abnormal condition. This has been produced by the rigorous heats and dryness of the past Summer; and now if the fall season should turn out changeable, from warm to sudden cold, with rain storms and damp weather, we shall have every physical and atmospheric condition favorable to the development of this disease, which is a catarrh of the mucous membranes of the respiratory organs accompanied with a low fever of typhoid type.

There is no doubt that this disease, like all those which are known as epidemic or epizootic, are preventible by good sanitary precautions. It is well to be forewarned. "It is in the air" already, and the precise moment when half the horses in a wide locality may be prostrated as by a sudden blow, everywhere instantaneously effective, cannot be indicated. To strengthen the animals and put them in a condition of robust health is the first thing to be done; the weak and worn need rest and good nursing; the plethoric and strong require to be cooled by laxative and antiseptic medicines. Every stable needs to be cleansed, ventilated, disinfected and drained. Generally stables are too warm and close and the abundant pungent vapors constantly irritate the tender membranes of the throat, nose and lungs, and prepare these in the readiest manner for the attacks of disease. This defect requires immediate attention.

When exposure to storms cannot be avoided, water-proof covers should be provided for the horses, and good care be taken to rub the coat dry after returning to the stable, and by careful attention prevent chilling of the body. Such chilling is wonderfully productive of what are known as malarial diseases. The germs and causes of these diseases, we believe, enter not so much through the lungs, as through the pores of the skin, or rather, being already in the blood, are prevented from escaping through the infinitely numerous pores in the perspiration by its sudden stoppage, through a chill. The sudden stoppage of this excretion through the skin throws a large quantity of poisonous matter brought to the surface for ejection, back again into the circulation, and also produces all the febrile and congestive results. Our domestic animals are so much exposed, by our thoughtlessness, to these evils that the wonder is, not that they are sometimes stricken down suddenly and without warning, but that they escape diseases so well.

The present opportunity is one that may well be used to impress upon our readers this fact, and to urge its careful consideration upon them.

BREVITIES.

THE White Elephant potatoes, six in number, displayed at the Queens Co., Agricultural Fair, weighed eight and a-half pounds.

PROF. BLOUNT: You advise in selecting seed corn to select only the topmost ear when there are more ears than one. Suppose the topmost ear is not so large; the kernels not so perfect as the others—would you still select it?

WE read very favorable accounts of the Beauty of Hebron Potato in the agricultural press of many different sections. We hope our second venture in the dissemination of new potatoes may prove as gratifying as the first.

OF the 12 ears of Chester County Mammoth Corn, grown at the RURAL FARM, which took the first premium at the Queens County Agricultural Fair, five of the best weighed eight and a quarter pounds. They bear 4,984 kernels or an average of 996 4 5 each. They are from 16 to 22 rows and average one foot in length. The longest is 13½ inches.

OCTOBER 1st.—We have to-day completed the sowing of 64 different varieties of wheat—for the most part new varieties or those very little known. While indebted to many of our subscribers for specimens sent, our first thanks are due to the farm Superintendent of the Ohio State Agricultural College, Mr. Thorne; Prof. Tracy of the Missouri Agricultural University, and Prof. Blount of the Colorado Agricultural College.

A REMEDY for itching tails and manes of horses is to wash the parts thoroughly with strong carbolic soap-suds as hot as the hand can well bear. If this, repeated two or three times per day for a few days, does not effect a cure, then dress the parts with petroleum lamp oil. But if the itching in the tail comes from worms in the rectum, then inject strong salt water into it and rub the outside of the same, directly under the tail.

An excellent way of disposing of some of our superabundant apple crop is attaining extensive dimensions. Last Saturday the fleet of steamers leaving this port for Europe took out the largest quantity of apples ever exported in one day. Of the vessels bound for Liverpool one had on board 7,500 barrels of apples and another 5,000. The low price at which the fruit can be sold in Europe must obtain for it a large sale, and its fine quality once known is sure to maintain for it in future a profitable market.

MAJOR FREAS advises to pack apples in dry barrels, and keep them under a shed, protected against rain or moisture, to remain there until late in November and freezing weather approaches; then to remove them to a cold, dry cellar, and headed-up the barrels, is as good a way way, where the quantity on hand is large, and the purpose is to keep them over winter for Spring sales. In fact, he has known apples put up in this way, that have been preserved sound and good into June!

MR. JOHN CLAY, JR., of the English Agricultural Commission, which visited the United States last year, says in his report: "The splendid herds showed an immense wealth among the farmers, and the labor of years in improving these will result, undoubtedly in a *great financial success, and a lasting benefit* to the country, because we have always observed, that a country which abounds in flocks and herds supports a well-to-do race of people." These remarks are no less true than encouraging to our live stock breeders of all kinds.

Literary Miscellany.

THE INDEPENDENT FARMER.

LET sailors sing the windy deep,
Let soldiers praise their armor;
But in my heart this toast I'll keep,
The independent farmer.
When first the rose in robe of green,
Unfolds its crimson lining,
And 'round his homely porch is seen
The honeysuckle twining,
When banks of bloom their sweetness yield
To bees that gather honey,
He drives the team across the field,
Where skies are warm and sunny.

The blackbird clucks behind the plow,
The quail pipes loud and clearly;
Yon orchard hides beyond its boughs
The home he loves so dearly,
The gray old barn, whose doors infold,
His ample store in measure,
More rich than heaps of hoarded gold,
A precious, blessed treasure;
But yonder in the porch there stands
His wife, the lovely charmer,
The sweetest rose on all his lands;
The independent farmer.

To him the Spring comes dancing day,
To him the Summer blushes,
The Autumn smiles with mellow ray,
His sleep the Winter hushes;
He cares not how the world may move
No doubts or fears confound him;
He smiles in calm content and love
On children gathered 'round him.
He trusts in God, and loves his wife,
Nor grief, nor ill may harm her,
He's Nature's nobleman in life—
The independent farmer.

INMATES OF LESTER HALL.

(Continued from page 662.)

CHAPTER VII.

THE sun is sinking slowly to its rest behind the western hills, changing the blue of the Summer sky into a gorgeous mass of gold and purple and red, and tinging the hills beneath with a rosy glow. Everything is very still in this evening hour—the laborer has left work; the "plowman homeward plods his weary way;" the bells are ringing out softly the call to evening prayer, and as the soft chime reaches over hill and dale, it steals into the room where Rex. Lester lies, with his face turned towards the window which opens on the west, and the red light falls on his pale face, giving it a strange, unearthly beauty, which may linger until he has passed through the dark valley which he is entering now.

Yes, Reginald Lester is dying; this is the last sunset he will ever see, which is shedding a stream of golden light on the couch on which he lies, on Mattie's head as it is bowed on the pillow near her brother's, and on Cecil's beautiful pale face, which is turned towards the window, white and still, and tearless, but full of a sorrow too deep for tears

It is but the day after that on which Cecil Lester found her brother prostrate on the greensward; but the two girls know the truth now—know that their brother is dying—dying, too, from the effects of the life he has led in that great city which swallows up so much that is good, and noble, and beautiful, for Rex. has not spared himself. He has told them freely all; he has made confession with faltering, broken voice truly, and great drops of pain on his brow, and the two girls who love him so truly find no room in their hearts for blame, only for pity.

But now, in these his last moments, there rises within him all the bitterness of his blighted hopes, of his ruined life; and while he owns that he has sinned, and sinned grievously, he blames bitterly the man who has taken advantage of his weakness and led him yet deeper into temptation and sin. He is telling Cecil of him now, in the weak, hurried accents of extreme weakness, and Cecil listens with the anger and pain in her eyes deepening, and the proud lips taking a yet more determined fold.

"Were it not for him I should not be here, dying, disgraced, ruined," he murmurs, bitterly. "He tempted and me when he had led me on to disgrace and shame, he threw me over without a word of regret."

Cecil's white teeth meet under her red lips and her eyes flash.

"This man, who is he?" she says, softly, as she bends over her brother and wipes the death-dew from his brow; and Rex. looks up at her with a sudden gleam of resentment in his dying eyes.

"His name is here," he says, feebly, putting out one weak hand, and feeling in the pocket of the loose coat he wears. "When I was dying—dying through him—he sent me this. Heavens! if I could only find strength to take my revenge—once!"

"I will find strength!" said Cecil, calmly. "I will revenge! I promise it, Rex."

He looks up for a moment into her face, so pale and set and stern.

"You will do it, Cecil?" he murmurs feebly. "And yet no! What a legacy for you, poor child!"

He has taken a little slip of paper out of his coat pocket, but he does not give it to her.

"I will do it! He shall suffer, even as he has made you suffer!" says the young girl, impetuously. "Why should he be exempt?"

"Cecil—Cecil!" says Mattie's low, broken voice, "Rex., my dearest brother, forgive him now!"

Reginald turns away from her a little impatiently. Consciousness is fast failing him, but he holds the little slip of paper tightly in his feeble fingers.

"Were it not for him I should not be dying here!" he says, with a last effort of strength. "It is he who has killed me, he through whom I am dying—Cecil—remember—this is the name—Ca—Ca——!"

His voice fails him, a dreadful spasm contracts his face, and he falls back exhausted, while Mattie puts some reviving cordial to his lips which the doctor has left when he called an hour ago, and told them that Rex. was dying.

"I will not forget, Reginald," says Cecil, steadily, as the dying eyes meet hers.

One hour, two hours slip by, the sun has set, the gorgeous golden clouds have died away; the gray evening shadow steals into the room, and the shadow of death creeps over Rex. Lester's face.

Suddenly he opens his eyes and gasps forth:

"Mattie—Cecil—forgive!"

The words die away, the heavy eyelids close; a long sigh, a shudder which passes all through the prostrate form, and all is over.

Mattie sinks down by the bedside, sobbing passionately; and Cecil, as she stoops and puts her tender lips to those which can never again return her caress, draws gently from the stiffened fingers the paper which is clasped in them, and slips it into her dress.

"I will remember, Rex," she says, softly. "I will keep my vow."

And thus she makes a vow which will color her whole life hereafter, and in the keeping of which she will sacrifice all the brightness and beauty of her life.

Poor Cecil!

CHAPTER VIII.

A NEW LIFE.

Mr. Daton's house was a very stately and magnificent mansion—as magnificent as it was possible for wealth to make it; but superb as it undoubtedly was, it was neither artistic nor in the most correct taste. Mr. Daton himself cared very little about it; so long as he had one comfortable room to himself, he did not take much interest in the rest of the house; and it created considerable surprise in his household—most of his servants had been with him for years—when he became possessed with a mania for altering and redecorating the reception-rooms of his house, and on becoming the convert of a certain great high-art, upholsterer, who had orders to completely metamorphose the drawing rooms, and to furnish a charming little boudoir in the newest style.

Well and thoroughly did the great man fulfil the great merchant's requirements. The drawing-room, from being a heavy, old-fashioned room, hung with crimson velvet and gold, became a fairy-like apartment, and was made altogether the most charming combination of high art and real elegance that could be imagined.

Mr. Daton could hardly believe that he was in his own house when he entered the room, but he looked pleased, and expressed his satisfaction in a manner which must have been agreeable to the great man who had made the change.

About the boudoir he was rather dubious; he did not quite appreciate the hangings, the dado of black and gold, and the quaintly-shaped chairs, but he supposed it would be all right; while the dining-room was in its way quite as great a success as the drawing-room.

The household were naturally thrown into a state of excitement by these preparations, and many were the discussions in the servants' hall as to the master's future plans; and of course the conclusion of the servants in general was, that these alterations and improvements pointed but one way—that their master was going to take to himself a wife.

"He was so dreadfully cut up at Mr. Lester's death," said the housekeeper, as she and Mr. Forbes the butler sat over a cup of tea in her comfortable sitting-room down stairs, "that I thought he would never take any interest in anything again; but lor', the poor young gentleman—a sweet young fellow, to my mind—has not been dead a year, and the master is quite himself again."

Quite himself again! Mrs. Bradley was perfectly right, for Mr. Daton seemed more cheerful than he had done for many a long month; and he was neither of an age nor of an appearance to preclude the notion that he was about to take a second wife, and give his stately home a mistress.

But the one did not necessitate the other; and although the house was to have a mistress, Mr. Daton had no intention of taking a wife, as Mrs. Bradley soon ascertained from her master's own lips.

"My two nieces are coming to live with me," he said, quietly, one morning, when she was summoned to his presence. "I wish you to give directions that they should have every attention paid them. Miss Lester is a most amiable young lady, and I have no doubt that you will all find her a kind and considerate mistress."

There was a slight emphasis on the last sentence which showed that Mr. Daton meant his eldest niece to be really the ruling spirit of the household, and which Mrs. Bradley was too sharp a woman to misunderstand or to neglect.

By-and-by Mr. Daton went away for a few days, and returned with two beautiful girls, exquisitely dressed in mourning, and attended by a French maid, who was extremely pretty, and soon made herself a favorite in the servants' hall, although Mrs. Bradley looked rather unfavorably on her slim waist and coquettishly-arranged hair.

"We have been in Paris since our dear brother's death," said Miss Lester, in her first interview with Mrs. Bradley; "and I am quite unused to the management of a large household, so I shall be glad of your advice and assistance, Mrs. Bradley."

Which speech, accompanied by one of Mattie's gentle smiles, quite won the housekeeper's heart, and made her declare that "though Miss Cecil was a trifle haughty, Miss Lester was the sweetest of young ladies."

His nephew's death had given Mr. Daton a great shock; the news came upon him with the suddenness of a thunder-clap, and he had traveled north immediately, and had arrived in time to see the marble face of the young man he had so much loved before the coffin was closed upon it. And although, in truth, he had nothing to blame himself for, there was much self-reproach mingled with his grief.

Very soon, however, when its first bitterness had passed away, he transferred the affection he had conceived for Reginald to his two sisters, and more especially to Cecil, who on her side grew to love and esteem this new-found uncle with all her heart; and when he urged the girls to give up their lonely existence in the old home, and to live with him, Cecil seconded the proposal strongly.

And so it was arranged that they should leave Lester Hall, and take up their residence with their uncle, after spending the first year of their mourning in Paris, where Cecil, at eighteen, threw herself into studies with a passionate ardor and energy which surprised her sister, who—while Cecil was going heart and mind not only into the mysteries of languages, but into the study of deportment, manners, and elegance—confined her study to that of music alone.

Mr. Daton was very frequent in his visits; and as months went by he was more and more struck with the alteration and improvement which Paris life was making in his youngest niece. Her style was perfect—her manners, always graceful, perfectly self-possessed, quiet, a trifle languid perhaps, and always tinged by that air of *hauteur* which is only not objectionable in a beautiful woman. Her dress, too, was unexceptionable, Mattie teased her sometimes for her study of the toilette, but the result was so charming, so artistic, and Cecil herself so lovely, that her vanity—if vanity it were—was perfectly excusable.

"I don't see why you need care so much about it," said Mattie, one day. "You are quite beautiful enough, Cecil."

"Am I beautiful?" the girl answered, thoughtfully.—"I am glad to be beautiful, and I intend"—a curious, darkened look came into the beautiful hazel eye for a moment, then she laughed slightly—"I intend to be perfectly irresistible!"

And perfectly irresistible Cecil was when she made her *debut* into society, at a grand ball given by her uncle shortly after the young girl's arrival in town—and a very great sensation she made. Both sisters were in white, without a touch of color, for both were in mourning still; and while Mattie's loveliness excited much admiration, her sister's more stately beauty caused general comment, and that first night's success made her an acknowledged belle.

Mattie herself was too sincerely unselfish to be jealous of her sister's superiority, and she rejoiced in her triumph all the more when she saw that Cecil herself was pleased, with a keen, eager pleasure Mattie did not quite understand. As for Mr. Daton he was proud and pleased beyond measure at seeing his nieces appreciated as they deserved. He had resolved that their *debut* should be a successful one, and it was so.

Cecil had her own horse and groom, and rode daily with her uncle, who smiled with pleasure at the admiring looks which followed his beautiful niece; and in the afternoon the sisters showed themselves for an hour or two in the handsomely appointed carriage which their uncle had given them, exquisitely dressed, and the observed of all observers. Then in the evening there were half a dozen different engagements to be fulfilled, although Mattie generally contrived to spare an hour for the opera, where she would listen to the divine strains of Rossini and Bellini, sitting as quietly absorbed in the music as Mrs. Audley herself, a lady whom Mr. Daton engaged as companion and *chaperone* to his nieces.

What a change such a life as this was from the retirement of Lester Hall. It was a continual round of gaiety and adulation, wearing beautiful dresses, meeting pleasant people and hearing exquisite music. Both girls were much sought after and both thoroughly enjoyed, Cecil especially, their popularity; and it would have been small wonder if, in the excitement of this new and brilliant existence, the young girl had forgotten the sad circumstances connected with her brother's death, and the vow of vengeance on him who had led him into evil. But she did not, and in every action of her life she had been influenced by the vow—by the desire for revenge against this man whose name was written on the slip of paper her brother's dying hand held. Unknown to, even unsuspected by her sister, this ruling motive colored all her life. She had formed no definite plans of revenge, but she had some dim and vague consciousness that her only arms against this man, whoever and whatever he was, would be her beauty, her grace and her fascination—therefore these must not be neglected.

It was a strange, wild scheme to enter into any girl's head, more especially into the head of a girl like Cecil, naturally so impulsive, so true and so frank; but she had conceived it, and if ever the power of vengeance came to be hers, she would use that power, even if it broke her own heart to do so.

None could have guessed that this young girl, seemingly so brilliant, so careless, so haughty, was cherishing such a desire in her heart; and it would have surprised not only the beautiful Miss Lester's partners, but those who loved her so dearly, her uncle and her sister, if they could have seen her sometimes on her return from some brilliant assembly, where she reigned supreme. If they could have seen the color fade from the beautiful face, the light die out of the lustrous eyes, the smile leave the sweet mouth, they would have wondered; and although if Mattie had seen her sister go to her dressing-case, take out a slip of paper, on which a few words were written, and stand brooding over them with firmly set lips and eyes full of yearning sadness and pain, she might have known that she was recalling her dead brother's last moments, even Mattie would not have know the dark thoughts filling her heart.

And these were the words written on the paper which Cecil had read and re-read so often:

"You have only your own confounded folly to blame for what has happened; had you taken your measures more skillfully, D——would not have discovered anything. I can't help you; I have run 'a-muck' myself, and must keep dark for a time."

The name signed at the end of these words was "L. Carewe," and whenever Cecil read it there came before her eyes vividly, as if it had been but yesterday, her brother's death—the beautiful dying face, the broken, feeble voice, the sunken eyes lighted with one flash of resentment, as the words came, gasped forth from the pale lips:

"When I was dying—dying through him—he sent me this. Heavens! if I could only find strength to take my revenge once!"

And her own answer sounded clearly in the young girl's ears:

"I will find strength; I will revenge; I promise it, Rex. He shall suffer, even as he has made you suffer."

And though as yet, Cecil could not see her way clearly, she was resolved to keep that promise even if it cost her the happiness of her life, or her life itself.

CHAPTER IX.

A DINNER.

"MATTIE, have you made out the list of invitations for me to fill in?" said Cecil, one morning, when the brilliant season was drawing to a close, as she entered the boudoir, and threw herself into a low chair beside the fire, which the cold, damp day, in the month of June though it was, rendered necessary.

"Yes, dear," Mattie answered from her seat, where she was writing letters, "but are you not going to ride this morning?"

"No, I am rather tired," replied Cecil, listlessly as she crossed her feet on the footstool.

"Flirted too much last night, I suppose," her sister said, with a smile. "Poor Mr. Gerald, I felt quite sorry for him!"

"Did you? there was not the least necessity; he is quite well able to take care of himself. Oh, Mattie, I am getting rather tired of it all," said Cecil, wearily, as she looked into the red gleam of the fire with a tired expression on the beautiful face.

"The reaction," said Mattie, gaily. "Never mind, the drive to Richmond will quite restore you."

"To Richmond?" said Cecil, looking up. "Oh, I had forgotten. Is it to-day the dinner-party takes place?"

"Yes," said Mattie, with the prettiest blush. "How could you forget?"

"It is quite possible!" said Cecil, laughing. "You were not likely to do so, Mattie. What answer is Mr. Edgar to have when he pleads his suit? Nay, darling, I did not mean to vex you, but surely you have noticed how irretrievably gone the poor young man is."

"Are you sure he is not 'irretrievably gone,' as you call it, on Miss Cecil, sister?" said Mattie, with a little laugh, which was not quite spontaneous.

"Quite sure," said Cecil smiling. "And I think to-day will decide it. Mattie; Richmond Park is a charming place for that kind of thing."

"Is it?" said Mattie, laughingly. "You have had more experience than I have. There is the list, Cecil; and as I have finished my notes, the desk is at your service."

"Thanks!" and Cecil moved languidly across the room, and took her sister's place before the writing-table, while Mattie went to the piano, and began to play some soft, dreamy melodies, which did not interfere with her sister's work.

For some minutes the silence was only broken by Mattie's soft music, for Cecil went on languidly addressing and filling the cards for a large ball with which Mr. Daton intended to conclude the season, without comment, and mechanically as it were.

She had almost finished her work when a name towards the end of her list arrested her attention. The fair face bending over the dainty invitation-cards flashed suddenly to the roots of the bronze-brown hair, then she grew white as death, as mechanically she took up the card and filled it in with the name of "Dr. L. Carewe," and having done so, she sat with the card before her, staring at it as if something in its aspect fascinated her.

"Mattie," she said, after a pause, speaking with her usual indifference of tone and manner, "who is Dr. Carewe?"

"I really don't know, dear," said Mattie, absently. "Uncle Henry knows him, and I think he said he was under some obligation to him, and hoped we should be civil. Uncle Henry says he is one of the cleverest men of the day, and that he will make a name for himself in his profession."

"Indeed!" said Cecil, quietly, as she put the invitation-card into its envelope, and addressed it to "Dr. L. Carewe," and concluded her writing without further comment, although the color was coming and going in her fair face, and the little jeweled hands shook so that they could hardly hold her pen.

"There are the cards, Mattie," she said, as she rose; "and now I think I will go to my room. My head aches, and I do not care for luncheon; if I lie down now I shall be fresh for this evening."

"Shall I come with you, and bathe your head a little?"

"No, thank you; I shall be better alone," said Cecil, ungraciously; and she went swiftly upstairs to her own apartment, locking herself in as she closed the door.

"At last—at last!" she said, aloud, as she paced up and down the pretty room. "At last, after all this weary waiting, my time will come! Rex, my brother, I will keep my vow; even as you suffered, he shall suffer; ay, and more—a thousand times more, if it be possible! It has been hard to wait, but at last my opportunity has come—at last!"

She went over to the looking-glass, and standing before it, examined herself critically—not like a young girl pleased and proud of her own beauty, but like a connoisseur examining a picture to discover its power.

What would be the effect if she strove to please? Would she fail now?

She looked at the face the glass reflected—at

the lustrous eyes, the matchless complexion, the tender carmine lips, the graceful head.

"I cannot fail now—I cannot fail now!" she said, proudly, as she turned away and threw herself on the sofa, where she sat, lost in thought, as the hours slipped by, recalling the past, meditating on the present, and planning for the future.

Not two years had passed since her brother's death, and but a few months since she had known the life the great world lives, and tasted of its pleasures. In those few months she had been sated with homage and admiration; she had awakened love in many a heart, even in this prosaic nineteenth century, when love is supposed to be a thing of the past; her days had been filled with variety and beauty, luxury and pleasure. No trouble had come to her, no suffering had touched her but she had not been happy. In the core of her rose the asp had lain, for her vow was still unkept—her brother was still unavenged!

But now, for the first time, it seemed possible that he might keep that vow, and avenge that brother; and with the possibility came a momentary fierce joy and triumph, succeeded almost immediately by as keen a pang of suffering. The thought was hateful to her—it was repugnant to the girls' really noble nature to cherish such a thought—but she turned away from the pleadings of her better nature, and conquered them by the recollection of her promise to her brother; but, nevertheless her reverie ended in a burst of tears.

But there were no traces of emotion upon her face as, a few hours after, she left her room, dressed for dinner at Richmond; and as her uncle went to meet her as she entered the dining-room, he thought she had never looked more beautiful.

"How are you, my darling?" he said, fondly. "Mattie tells me you had a headache."

"I am quite well now, as you see, dear uncle," she said, as she lifted her face to his. "Where is Mattie? Mr. Edgar will be here in a moment."

"Mattie is not yet down," he answered, smiling. "That is rather unusual, is it not, Cecil?"

"Ah! but to-night is an unusual occasion," said Cecil, smiling. "What shall we do without our Martha, uncle?"

"Do you think she will leave us, Cecil?"

"I think Mr. Edgar will steal her!" said Cecil, smiling.

Here Mattie entered, looking very lovely in a dainty dress of cream and blue; and she was followed almost immediately by Mr. Edgar a handsome young man of large fortune, who had been Mattie's most devoted admirer ever since her appearance in society. And judging from Miss Lester's blush and sweet shy smile of welcome, he was not the least favored among her admirers.

His four splendid bays and carriage were very handsome.

The drive was a pleasant one; and Cecil, sitting beside her uncle, with her hand in his, enjoyed thoroughly the swift motion through the still, dewy evening air; and Mr. Edgar divided his attention between his other friends and Mattie with strict impartiality.

At length they reached the great hotel, and Mr. Edgar pulled up in dashing style before it.

"I hope we are the first arrivals," he said, as he relinquished the reins. "I do not like my guests to arrive before me."

"Is that one of your guests?" said Mattie, smiling, as she indicated a tall man, who was slowly pacing up and down the entrance-hall, apparently lost in thought, and so absorbed that he had not noticed their arrival.

"Yes, so it is!" said Mr. Edgar, eagerly. "My best friend. I hope you will like him. Hallo, Lawrence!" he added, calling out in his gay voice. "I'm delighted to see you! I thought you would fail me."

"Not likely, when I had promised to come," said the gentleman, in a deep, rich voice, which had a singularly pleasant tone in it, as he came down the steps to meet his friend, and shook hands warmly; while Cecil, from her elevated position, glanced down at the stranger, and saw that he was a tall man, considerably taller than Mr. Edgar, who was himself of no mean stature, largely built, with a pale face, having tawny beard and keen gray eyes.

"Not handsome," said Cecil to herself, "but very nice and rather *distingue*," she added, as she watched the introduction to Mattie, and then saw that her uncle was evidently well acquainted with the stranger, for they shook hands warmly; and then Miss Cecil had to turn her attention to her own proceeding, and to make her descent from the elevated seat she occupied.

This she felt no difficulty about as it was not the first time by many that she had done so; but to-day it so chanced that just as she put her little feet on the ladder, the horses made a sudden plunge forward, the ladder was thrown down, and but for the instant movement of Mr. Edgar's guest Cecil might have met with a serious accident. As it was, she was more frightened than hurt; and when they all gathered round her, as she stood still supported by the strong arms which had caught her as she fell, she tried to laugh and assure them that she was not hurt; but the effort was beyond her—she gasped for breath; the beautiful head fell against the arm that held her, and her eyes closed!

Still, she had not lost consciousness, and she had a dim idea that a pleasant voice said hurriedly: "It is nothing, do not be alarmed, Miss Lester; and that strong arms lifted her as if she had been an infant, and carried her into the hotel; that the same strong hands very gently and tenderly laid her down and applied restoratives; and when she opened her eyes she saw Mattie, looking pale and startled, bending over her, while the strange gentleman stood near, holding her wrist between his fingers in a strictly professional manner.

"You are better?" he said, bending down as her eyes met his; and something in his voice so cheerful and re-assuring sounded pleasant in Cecil's ears.

"Yes, much better," she said, faintly. "How foolish of me! Did I frighten you, Mattie?"

"Yes, a little; I have never known you to faint before, Cecil. I was afraid you were hurt, said Mattie, smiling. "It was fortunate we had a doctor near at hand, was it not?"

"I was very foolish," said Cecil, trying to smile. "I don't know what possessed me."

"You feel no pain at all, I hope."

"Oh! no," said Cecil, as Mattie went away to give news of his niece to Mr. Daton. "I am only very much ashamed of myself."

"There is no need," he said, with a little smile. "You might have been severely hurt. It was quite natural to faint under the circumstances."

"That I am not hurt I owe to you," said Cecil, coloring a little. "How can I thank you?"

"Nay, I am glad to have been of some slight service to you," he said, quietly. "No, you must not move yet awhile," he continued, as she made a movement to rise.

Cecil replied with a few laughing words of protest, at which he smiled; but something in his manner showed that he expected to be obeyed, and Cecil leaned back on the cushions and glanced with more interest than was usual in her at his face, he stood leaning against the open window, with his face turned towards the park, looking green and beautiful with luxuriant Summer attire. —To be continued.

NEW PUBLICATIONS.

Half a Century.—By JANE GREY SWISSHELM. Price $1.50. Chicago. Legal News Co., publishers.

The reputation of the author is wide-spread. She is a strong advocate of progressive principles and clearly asserts her opinions. This her latest work combines the historical, biographical and novel features of literary production. It portrays her own character and life—showing great activity in many fields of labor. The fifty years of experience is related in an instructive and entertaining manner; leaving the reader with the knowledge of more than personal reminiscences. One of the striking points is that of the ghost, showing the fallacy of this particular superstition. Much of interest might be quoted but we leave the rest to be obtained from a perusal of the book.

Eastward Ho! or adventures at Rangeley Lakes. By Capt. CHARLES A. J. FARRAR. Boston. Lee Shepard.

The author has succeeded in that which he has undertaken, viz.: the "instruction and amusement of American boys in this, the first of a contemplated series of books. The love of the marvellous usually indwelling in a boy's heart will be roused by this history of the brave boys who tramped amid the wilds of Maine braving danger, bears, and divers evils; enduring hardships and fatigue during their vacation instead of a luxurious rest at home. Their many exploits are told in a pleasing manner, while the description of scenery, which is illustrated by a map, adds not a little to one's geographical knowledge.

Practical Lessons in English.—By J. M. B. SILL, A. M. New York and Chicago. A. S. Barnes & Co., publishers.

These "practical lessons" in English, bid fair from the novelty of their arrangements to become attractive to teachers, and a rest to scholars, who welcome something new in the study of Grammar. The author dispenses with many tiresome features which belonged to this study in the school days of yore. As a guide to perfect composition it is invaluable.

MAGAZINES FOR OCTOBER.

THE PHRENOLOGICAL JOURNAL.—Contents: Sojourner Truth, portrait; Notes on the Psychology and Pathology of the Brain (Continued); Studies in Comparative Phrenology—The Ethmoidal and Sphenoidal Bones in the Quadrumana, Carnivora, Rodent and Bird, illustrated; The Literati of Concord; James B. Weaver, the Greenback Candidate for the Presidency, portrait; Intellect, as a Means of Obviating Our Faults; Inside and Out, a Society Sketch; O. S. Fowler, to the Patrons of the Phrenological Journal; A Weather Guide for the People, illustrated; Beer and Bread; Henry S. Tanner, M. D., the Great Faster, with portrait; The Value of Health and Life; The Young Chemist's Revelations; Notes in Science and Agriculture; Editorial Items; Answers to Correspondents; What They Say; Personal; Wisdom and Mirth; Library Notices; Publishers' Department.

LIBERAL CULTURE FOR WOMEN.—The fears entertained by certain of our old-fashioned doctors concerning the effect of high education upon young women have not, to all appearance, retarded the increase of colleges for their special training, or the growth of a public sentiment in favor of supplying all the advantages for the cultivation of the feminine mind, which are at the command of the masculine. Vassar has found it necessary to add departments for the study of sciences and languages, which are usually pursued by the few who make them special subjects of investigation. Smith College finds it expedient to expand its curriculum to meet the demand of a growing student roll and an advancing scholarship.

Even old Harvard has yielded to the pressure of influence, and opened her doors, with certain conditions not altogether fair, we think, to young women who aspire to high scholarship, and who can *pay* liberally for the instruction.

The West has been somewhat in advance of the East in affording academic opportunities to girls, mixed and special colleges having been in existence in Ohio, Illinois, Indiana, Wisconsin, and other States for twenty-five or more years; and they have performed a noble work in raising the tone of moral and intellectual character of the Western population.

The recognition of woman's equality carries with it an admission of her right to a liberal education, and her liberal education, we think, will do more toward re-solving successfully the complex problem of her sphere in society than any other method.

The thousands of cultivated women who now grace the walks of professional and even business life, have demonstrated in the most practical manner, not only their capability for good work in vocations once regarded as belonging peculiarly to the masculine intellect, but also that they may prosecute such vocations without injury to health, and without relinquishing a degree of true womanliness.

We can no longer assert that systematic study is more detrimental to the health of girls than boys for it has been found that under like conditions girls exhibit a better physical average than boys, and so are even less likely to break down under mental strain. This being considered, we would naturally expect the declaration which has been made by certain of our leading educators, that the young women are outranking the young men in the studies of the average college curriculum. To our masculine ear this utterance goes somewhat "against the grain," but we may apologize for our sex by pointing to the very manly athletic exercises which take up so much of the time of young men in our best institutions—the rowing, ball-playing, etc., which have their advocates among learned sanitarians as quite essential to vigorous physical development?

We are in favor of high mental training for American women. The character of our institutions early brings into activity the selfness, individuality, or sense of independence inherited from independent, self-helpful fathers and mothers, and they need liberal education for the general work society has for them to do, whether as wife and mother, or as one who must earn her own living.—Phrenological Journal, for October.

GOOD COMPANY, NUMBER TWELVE.—Two papers just read before the American Social Science Association are given, both on subjects which have been attracting considerable attention of late. One, about food adulterations, is by a competent authority, Prof. S. W. Johnson of the Yale Scientific School. It will doubtless relieve some people who have been somewhat alarmed by recent newspaper paragraphs. The other, Associated Charities, explains the modern method of organization by which the various benevolent societies and individuals in a town unite so that a large proportion of money given in charity need not be wasted as is now generally the case, and the deserving poor be more effectively reached. It is by an authority on the subject, Rev. Oscar C. McCulloch of Indianapolis, one of the places where the plan is in practical operation. Two other articles bearing on the same general subject are The Destruction of the Poor by President John Bascom of Madison, Wis., University, and an account of the doings of the late Conference of Charities and Corrections.

Savonarola and the Renaissance is a careful synopsis and estimate of the great reformer's work by Mr. Noble C. Butler of Indianapolis. There are three stories; When Two and Two did not make Four, by Miss Louise Stockton; The New Jerusalem, a Millerite story; and How Cherry Thought of It. One of the sketches tells of some of the great excursion places near New York where people flock by the ten thousand in Summer; another of a visit to the factory in Meissen, Germany, where such exquisite china is made.

There are also Recollections of Seward, Greeley, Lincoln and Douglas; and papers about camp meetings, in favor of family movings as a social benefit, about the servant girl question; besides other articles.

Taking Turns at the Crib has special application where public officials are about to be nominated.

Good Company, Number Twelve ($3.00 a year; Springfield, Mass.,) closes the volume, and subscriptions should be made at once. A specimen copy will be sent to any one not familiar with it for ten cents.

THE OCTOBER ATLANTIC has no serial story, but instead gives one long short story called "A Florentine Experiment," by Constance Fenimore Woolson, one of the best of American writers of stories; and another, "Deodand," by W. H. Bishop, author of "Detmold." Dr William James, brother of Henry James, Jr., writes a very interesting and thoughtful article on "Great Men, Great Thoughts, and the Environment." "Socialistic and other Assassinations," by James Henry Haynie, brings together many curious facts for those who study social phenomena. The second part of the "Intimate Life of a Noble German Family," is quite as engaging as the first part, and gives us a most interesting insight into the lives and ideas of the higher classes of Germans. The careful and valuable "Reminiscences of Washington" this time relate to President Tyler's administration. Richard Grant White discourses of the prevalent habit of drinking in England, terming it "A National Vice." The political article discusses the "Business Issues of the Presidential Canvass." "People of a New England Factory Village" is a paper of genuine interest. Mr. Whittier has a characteristic, beautiful poem, "The Minister's Daughter." Mr. Aldrich contributes a short poem, "Comedy," and there are also poems by Robert Louis Stevenson, Helen Barron Bostwick, I. Oppenheim, and Francis Ekin Allison. Several important recent books are reviewed in the careful and readable style for which the Atlantic is distinguished, and the Contributor's Club contains several bright little essays.

ST. NICHOLAS.—Contents: Frontispiece, "Ahoy, lads! Ahoy; Hap; The Lantern Fly; Robin, Good-bye! Poem; A Tired Mother, Picture; Ludovick's Rocks; A Tragedy; Jack and Jill; Concluded; Naughty Kitten: "It is the Cat!" Picture; Lily Chapel; Day-Dreams, Poem; The Naughtiest Day of my Life, Concluded; The Major's Big-Talk Stories, No. VIII.; Zack's Excursion Trip; In the Orchard, Poem; Some Man-Eaters; The Stove and the Thermometer, a fable; Charity's Charter Picnic; Slumber-land, Poem; The Cat's-meat Man of London; The Alphabet in Council; How to save Time; Discussing the Crops, Picture; The House with the Lace Front; The Little Violinist, Picture; The Fairport Nine, Concluded; Washing Dolly's Clothes, Picture; For very little Folk; Jack-in-the-Pulpit; The Letter-Box; The Riddle-Box.

SCRIBNER'S MONTHLY.—Contents: Porpoise Shooting, Illustrated; The Grandissimes, XII. (Concluded; Among the Reeds; Jean Francois Millet—Poet, Peasant and Painter, II., Illustrated; The New South; A Group of Poems; Shantytown, Illustrated; Miss Stotford's Specialty; Peter the Great, IX., Illustrated; Seven Seconds; To Bolt or Not to Bolt; "There is a Natural Body;" One Hundred Miles in Mammoth Cave, Illustrated; Sea-Side Lawn Planting, Illustrated; A Free Lending Library for New York; Topics of the Times: Communications; Home and Society; Culture and Progress; The World's Work; Bric-a-Brac.

For Women.

CONDUCTED BY MISS RAY CLARK.

WOMAN'S WORK.

DARNING little stockings
For restless little feet;
Washing little faces
To keep them clean and sweet;
Hearing Bible lessons,
Teaching Catechisms,
Praying for salvation
From heresy and schisms—
Woman's work!

Sewing on the buttons,
Overseeing rations,
Soothing with a kind word
Other's lamentations;
Guiding clumsy Bridgets,
Coaxing sullen cooks,
Entertaining company,
And reading recent books—
Woman's work!

Burying out of sight
Her own unhealing smarts;
Letting in the sunshine
On other clouded hearts;
Binding up the wounded,
Healing of the sick,
Bravely marching onward
Through dangers dark and thick—
Woman's work!

Leading little children
And blessing manhood's years;
Showing to the sinful
How God's forgiveness cheers;
Scattering sweet roses
Along another's path;
Smiling by the wayside,
Content with what she hath—
Woman's work!

Letting fall her own tears,
When only God can see;
Wiping off another's
With tender sympathy;
Learning by experience,
Teaching by example,
Yearning for the gateway,
Golden, pearly, ample—
Woman's work!

At last cometh silence—
A day of deep repose;
Her locks smoothly braided,
Upon her breast a rose;
Lashes resting gently
Upon the marble cheek;
A look of blessed peace
Upon a forehead meek!
—Richmond Christian Advocate.

SUSY'S FANCY WORK.

"I THINK it is too warm even for fancy-work said Laura vigorously fanning herself as she entered the room, where Susy was busy over pasteboard and glue, shaping rough crosses and picture frames, out of common box-board. "I wonder at you, Susy working so hard this uncomfortable day."

"I am improving my time, while the children are at the picnic, by getting some Christmas things prepared."

Christmas things this time of the year! I guess you must want to keep cool thinking about it."

"I like to be in season with my preparations then I am not hurried when the time comes, and I am not likely to forget anybody, I have a box-full of goods now all finished and labeled and tied up securely and put away in a safe place, ready for the Christmas tree. It is so easy to prepare little things as you go along through the year, and so hard when you put all off until December.

Just now I am preparing these crosses and frames for Autumn leaves. I made some beautiful ones last year and they have adorned various niches in very handsome rooms ever since. I will get my frames ready, and when the leaves turn their brightest I shall prepare a box full for use. Some leaves turn early and I have a good many already prepared. I find nothing better to fix their colors and give them a gloss than fine resin ironed over them with a warm iron, giving them only a thin coating of the substance. When I put them on a cross like this I begin at the ends of the arms all around and sew on the leaves lapping them so as to hide the stitch every time. Work towards the center. There will be a vacant space, on which fasten a pressed flower bringing the stem through a hole in the pasteboard.

You see I have not much money to spend on Christmas gifts, Laura, so I have to depend on my wits mainly to devise something that will make the little folks happy. I save scraps all through the year and it is astonishing what can be done with them. See this little box of dolls things for Lucy all made from some old trimmings aunt gave me."

It was a wonderful box, sure enough, a dainty dolls hat with satin ribbons and a downy white feather (from the breast of the white turkey, I will say in confidence) lace fichus, a fine lace edged handkerchief, and even a lace shawl; what little

girl's eyes would not sparkle over such a gift to her new dolly. Even the baby had his box of treasures fashioned by Cousin Susy's nimble fingers. And the reason why she could make everybody such dainty presents in such profusion on Christmas day was just because she bore it in mind all through the year and began in season. I hope some other dear girl will say. "I will do just that way myself." LOIS.

JUST TRY THE EXPERIMENT.

Fine rains have made the late gardens bring forth abundantly, and fruit trees are so laden in many sections that they need props to keep them up.

While we rejoice in these good things which the kind Father has given to us, let us remember those near us who have no part or lot in this abundance. The poor and struggling householders who have no ground to cultivate, and where existence seems almost a daily miracle.

What a blessing to the poor widow yonder, stitching her life away on that dreary "Southern work", as they call it, would be a basket of supplies from your luxuriant garden. A few hills of potatoes, which you would never miss, a dozen of corn, a paper bag filled with those ruby tomatoes. How her children's eyes would brighten at the sight of a basin of white harvest apples, a few pears or rosy peaches. I know the garden would be none the poorer, for I have tried, and have seen others try, this experiment of scattering and yet increasing.

Good Grandfather M. drove into town one day with a load of fine apples, but the market was full and no one cared to buy. He did not wish to take them back, so he bethought him of a poor widow who might be glad to have them, so he drove around to her little house, and told her if she could store them away she might have them. Such joy and gratitude he had seldom seen, as shown in her broad Scotch face, and in the faces of her four children. He had not even guessed her great destitution, but afterward ascertained that these apples and bread were their main living all that Fall.

Every year after that, as long as she lived in that section, she was told to come in the Fall and get a wagon load of apples from the orchard for her Winters supply. A good neighbor kindly loaned his horse, and the children helped pick up the fruit, partaking of a bountiful dinner at the farm house. It was *the* event of the year to them. Always after the good woman went away she asked for the Lord's blessing on the orchard. "May ye never want for an apple crop."

It is years ago since grandfather died, but at times the neighbors still say. "How is it your orchard always bears whether others do or not?"

"It is the old Scotch woman's blessing," is the answer.

If you were sending a gift to your Lord you would not hestate to pick out your soundest, fairest fruit. Remember he has said, "Inasmuch as ye have done it unto one of the least of these, ye have done it unto me." It seems wonderful that he should notice such little gifts, but we have his word for it. Surely that should be a sufficient stimulous. MRS. J. E. MON.

A FEW HINTS.

IN wearing shoes, always smooth out the wrinkles and the marks of the toes and ankles when taking them off at night. Then they will look new very much longer, as they will not so soon become set to the shape of the foot, and white spots will not form at the great toe and side.

Change stockings backward and forward from foot to foot. In this way they will wear evenly, and not be so likely to break out in holes on one side while the other remains comparatively good.

When taking a sponge bath in warm weather, begin at the waist first and finish with the feet. Then change the water and towels, and completing the bath, end with the face and neck. In this way one does not become all heated up with the exertion and feel scarce cleaner and fresher than before.

A lady friend has made for every sleeping room in her house a valuable convenience, in the following manner: first, she took a soap box and had it mounted upon four legs, which were originally pieces sawn off in shortening bedsteads. To the box she had attached an outer lid, with hinges. An inner lid fitted at the top upon the strips nailed in for the purpose just below the edge of the box. This inner lid was perforated in the centre, and provided with a movable piece, and both lid and piece could be easily moved whenever required. Immediately beneath the inner lid and on the bottom of the box, in the centre, was nailed a large square block, of a size sufficient to support a piece of crockery ware, and of a thickness adequate to raise it up so as to touch the inner lid from below. The whole woodwork was then stained to imitate walnut; so that when finished the article made quite an addition to the bed-room furniture. Such a one, bought at a store, would have been quite expensive; but this cost but a few cents and it looks almost as well. An article of the kind is especially valuable to those living in the country where the lack of drainage precludes other conveniences—particularly is this the case in cold or stormy weather. But those living in the country may think such a thing too costly, and, in consequence, often suffer much annoyance. To all such I would say, here is a simple, easy mode of supplying yourselves with what, once had, you will never want to do without.

MARGARET B. HARVEY.

FARM LIFE.

IN these *striking* days, when nearly every newspaper contains some article advising the "out-of-work" mechanics and laborers to leave the crowded cities and villages and try earning their bread by the tilling of the soil—there is often much wonder expressed at the reluctance of those unfortunates to take this good advice. But when I look about and see the lives that many farmers lead, *I* do not wonder.

I know men worth all the way from five to twenty thousand dollars, with fine houses, and commodious barns—few of the latter large enough to contain their bountiful harvests—whose days from early dawn till long past sunset, are spent in the most unremitting toil. True, time enough is taken to satisfy Nature's craving for food and drink, but how? why, by hurrying into a hot kitchen, taking a hasty "dabble" at the sink, sitting down to a disorderly table and sharing with the flies, of the abundant supplies, provided by the tired, and probably cross housewife, for we women are apt to be touchy when we are overworked and worried, just as *some* of our masculine companions are.

Don't imagine farmers hereabouts lack for fine parlors and shady dining-rooms, oh, no! but these cannot be used *everyday*—they must be kept for company; so, too, the pretty dresses and adornments of the mother must be saved, and the faded soiled ones worn, to correspond with the uncombed hair and untidy feet, which too often is the uniform "from morn till dewy eve." There is no need of farmers living in this way, but that many *do* we all know, some one wiser than I must say why.

But is it a wonder that sons and daughters leave such homes as these—where books and newspapers if provided, are often unread, for lack of time—and try other ways of getting a living—more enticing than farming, which should be the most pleasant of all labor?

Who can see the beauties of this lovely earth better than the farmer and his family, if they do not spend all their time in the cultivation of their land, but remember that they have heads and hearts?

It will be easy to convince these unemployed townsmen that it is good to live in the country, when we learn to appreciate, and make good use of our blessings. When our lawns are as clean and attractive as the little squares in town; our houses and families as neat and attractive as the merchants' or the lawyers' houses and families, and when farmers and their families have read, marked and learned, so that they can converse more intelligently than many are capable of doing now.

MARY MANN.

FASHIONS.

HOODS, fichus, and peterines, of various styles and dimensions are now fashionable.

COLLARS are also being made immensely large; for morning wear they are not altogether white, but scolloped out and embroidered with red, black, blue, &c. This, well and tastefully selected, gives much harmony to the toilet. The cuffs are either plain or plated, but always matched to the collar.

THE deep sailor-collar in surah of two shades of color, plain or figured, fastened with a somewhat loose bow of the same, is very pretty. It is worn with the high-necked dress, either of the same or of another color, according to taste, provided the colors, if contrasting, are selected with care.

HATS for morning wear are made very simple, with little ornaments; as a rule they have neither flowers nor feathers, but only a large bow of soft surah in front upon the crown; below this a thick quilting of unbleached tulle or lace, coming a little beyond the border; behind, the ribbon or surah, twisted so as to become quite small, is passed through the straw and then tied under it in a bow, which droops over the chignon; this is a very clever arrangement, for with the small knot of hair which it is now considered pretty to wear at the back of the head, there is under the hat, with its lowered brim, an empty space unpleasing to the eye.

A DUCHESS hat is of Leghorn straw, open border, lined with a band of dark red velvet slightly gathered at both edges. Two long shaded red feathers trim this hat, one droops over the crown, the other comes forward over the edge of the border; a bow of palest pink satin placed on the right side completes the trimming.

THERE is also a bonnet of fine black English straw, edged with a jet bead border, finished with a bead fringe; semi-wreath of large closely-pressed red poppies round the front part; aigrette of black and old-gold feathers at the sides; bow and very wide strings of poppy-red satin.

To these very new and stylish bonnets and hats may be added the pretty little Creole hat of rough-and-ready straw, bent down in front and at the back, and trimmed with a Madras kerchief in rich warm colors, coquettishly tied on one side. For young girls the kerchief is sometimes exchanged for an enormous Alsacian bow of velvet or satin ribbon.

Plaids, not in the Scotch but Madras style, prevail in new Autumn goods. Here colors are so blended together as to form an harmonious whole. Uncertain shades of green and blue, with every possible shade of yellow; deep reds, with flesh color, dull shades of lilac, grays and browns; such are the favorite mixtures, as different as possible from the bright tints of Scotch plaids.

Madras plaids are extremely fashionable. They are now reproduced in silk and woolen fabrics. When not entirely of this plaid, the costume is very generally trimmed with plaid kerchief-borders effectively disposed, so as to show to the best advantage round the outline of double skirt or tunic, blouse or casaquin-bodice.

A dress of Madras plaid in attenuated shades of green and blue, with a few touches of bright red and yellow, is made in the Princess shape behind and with a basque in front. It is trimmed in the shape of a fichu with bands of bluish-green velvet finished with a flowing bow of satin ribbon to match; a pointed tablier, trimmed at the edge with a similar band, and is finished at the back into two shawl-points, which form the tournure. The skirt is trimmed round the foot with a deep fluting, edged with a band of velvet.

BE INDEPENDENT.

A Word to Young Farmers' Wives.

THE unavoidable labor on a large farm can be much more easily met and accomplished if every mistress of a house would cultivate sturdy independence with regard to her household affairs.

A woman with half a dozen children ought not to expect to have as many nice things or as many leisure hours as the neighbor who perhaps has none, or only one.

Every woman should plan her affairs with an eye to her own income, and not wish to copy from her friends.

Happiness and peace lie in the path of independence. If your neighbor makes four kinds of cake when she expects you to tea, set her a better example when she returns your visit, by getting a less elaborate meal, and by this means save your time and strength. AUNT RACHEL.

No matter what your feelings or ailment is, Hop Bitters will do you good. Prove it.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

MENTAL AND SOCIAL IMPROVEMENT.

M. H. L.

How interesting and full life becomes when we have well defined aims—how listless and unhappy without them. The poor factory girl toiling day after day, thinking of Saturday's pay, and how much comfort she can give to those who depend upon her, is far happier than the well-to-do person without any purpose in life. Is it not because boys are usually educated with a definite aim that they are mentally stronger and better able to meet the rubs of life than the girls who often pass much time in listless dreaming over their possible future, the result perhaps of reading silly novels which tend to give perverted and false views of life, weakening instead of giving vigor to the brain? Let the girls be educated with a practical outlook and how different their future would often be, and would we not have fewer unhappy marriages where the wife is full of fancied neglects, often imagining herself a victim to misplaced affection?

This is an age of progress, and instances can be adduced to show that the time has passed for discussion about whether or not the girls can be educated side by side with the boys. This has been fully tested, and when women vote we shall not hear so much of wife beating.

In "The Popular Science Monthly" for May, 1878, is an article on wife torture in England, in which facts are given that would startle the most credulous. I am glad our English sisters are up and doing in the women question. I spent a short time in a somewhat isolated country village this Summer, and the simple villagers were surrounded by the most charming scenery. Nature had been lavish in her gifts to them, but they plodded along day after day, never seeming to look up and drink in the grand and beautiful about them. I could not help thinking that if Charlotte Bronte had had such surroundings, instead of that barren moor whence she sent out Jane Eyre, a book full of imagination and fire which has thrilled the civilized world, how she would have appreciated it. The trouble with the villagers seemed to me to be that they had so few wants. They eat, drank and slept, living only to gratify their lower instead of cultivating their higher natures; in short, without a well defined and exalted aim in life.

The long Winter evenings would soon be upon them, and I ventured to suggest that it might be a good plan for some of the younger and more intelligent among them to organize a kind of literary society where they could converse freely on some topic previously agreed upon. For instance, take some city—Paris, London or New York; or, if preferred, take a famous individual—Wesley or Luther—and let each member read up and use all available means of finding out on the subject what will be instructive and interesting at their meetings. In this way the latent talent will be developed and an influence will spread abroad which would open up a desire for still further investigation on other topics. I was gratified to learn on my next visit that the project had been favorably received, and on Sunday I had the pleasure of hearing the minister announce from the pulpit that on such a day and hour the first literary meeting would take place. Is not this a step in the right direction?

WHAT TO DO IN AN EMERGENCY.

A PERSON accidentally got a fourpenny coin into his windpipe. It was wedged in edgewise, and his breathing was not interrupted, except that it produced a kind of wheezing noise, similar to that of an asthmatical person. He sought a surgeon, who administered an emetic, and said that nothing more could be done. The emetic failed to remove the coin. The next day he called on another surgeon, who by auscultation could detect the coin at the bottom of the windpipe. He was told that no more could be done for him, and that mortification would soon set in. A lady told him of a similar accident, and the way it was removed was by placing the gentleman on his head, and giving him a violent slap between the shoulders at the bottom of the windpipe. A cushion was placed on the floor for his head, his legs held up and a violent blow given on his back soon made him exclaim, "Here it is!" The coin fell from his month to the floor.

HATTIE HOPEFUL.

SPONGE CAKE—AND STIR PANCAKES.

THE following recipes were given us by Mrs. G. T. H., of Long Island. Mrs. H. has become noted, and justly, in her neighborhood, for her sponge cake, and her directions for making it are in this wise: Nine eggs, the weight of eight eggs in sugar and the weight of four in flour, a tablespoonful of lemon juice and a little of the grated rind. Separate the yelks from the whites, adding the yelks, one at a time, to the sugar and beating each thoroughly with the sugar, then stir in the lemon juice and rind, next the whites whipped to a stiff froth and, lastly, the flour—puttingit all in at once—after which stir as little and lightly as possible. For baking use the ordinary round bread tins or bar cake tins. Line with paper, grease or not, at pleasure, and bake in an oven suitable for bread baking (an oven that will brown bread within 10 minutes after placing it in oven) 40 or 45 minutes. Try with a bent broom whisk. As soon as taken from the oven turn out of the pan and *slide* onto an inverted sieve—this requires dexterity. Mrs. H. always frosts the bottom of the cake, that being the smoothest.

The recipe for "stir pancakes" originated in her immediate family and these are a very popular dessert with them. She remarked that in times of unexpected guests, when there was not time for a more elaborate dessert, these cakes filled up the gap and were always sure to be appreciated. Take a quart of sweet milk, four eggs, a pint of sifted flour, slightly heaped, and a little salt. Beat the eggs, add a little of the milk, then a little of the flour and so on until all are in. Put a piece of butter the size of a walnut, into a frying-pan; when heated put a teacupful only at a time of the batter into the pan, and at once commence to stir up with a knife, exactly as one would when scrambling eggs. Work into a round cake about the size of a small tea plate, and as soon as nicely browned, turn with a griddle-cake turner and brown on the other side. As they are taken from the frying-pan do not pile one upon another. Serve with butter and sugar—granulated or powdered.

DOMESTIC RECIPES.

To Clarify Fat.

Cut into small pieces, fat of either beef or mutton. Put into a saucepan and cover the pieces with cold water. Stir until the water boils, skim carefully and allow to boil until the water has all been discharged in vapor—the fat will then be of the color of salad oil—strain, and it will keep any length of time.

MRS. L. JONES.

Apple Batter Pudding.

Four beaten eggs, one pint of rich milk, two cups of flour, one teaspoonful of salt, two even teaspoonfuls of baking powder. Peel and core eight ripe, tart apples; put into a deep, baking-dish; fill the center of each with sugar and pour the beaten batter over them. Bake an hour and eat with cream and sugar, flavored with nutmeg or lemon.

Good Apple Butter.

Boil a kettleful of new cider until reduced two-thirds. Have a quantity of tart, juicy apples pared, cored and sliced, and put in as many into the kettle as the cider will cover. Cook slowly until tender, skim out and put in a second supply of apples. When tender turn all out and let stand over-night. In the morning return to the kettle and boil down until quite thick. Add whatever spice you please. It requires almost constant stirring.

MRS. J. J. K.

Quince Preserves.

Pare, quarter and core, saving the skins and cores. Just cover the quarters of quince with cold water and simmer until tender. Take out the pieces carefully, and lay on flat plates. Add the parings, etc. to the water, cover tightly and stew an hour. Strain through a jelly-bag and to each pint of the juice add a pound of granulated sugar. Boil, skim, add the pieces of quince and boil gently 10 minutes. Turn out and let stand over-night. In the morning skim out the pieces, boil up the sirup, put in the pieces, simmer 10 minutes, take out onto flat dishes and set in the sun. Let the sirup boil until it begins to jelly, then fill the glass cans two-thirds full of the fruit and cover with the sirup. MARY B.

To Bleach Ferns.

A 10-year subscriber asks some of the RURAL readers, who have experience, to give directions for bleaching ferns.

The greatest nourishing tonic, appetizer, strengthener and curative on earth. Hop Bitters.

News of the Week.

HOME NEWS.

MONDAY, Oct. 4, 1880.

Dr. Buchanan of Philadelphia, of bogus medical notoriety, has given up the fight his colleges and their charters have been annulled. The Doctor is safe in jail.....Job Chadwick, son of a wealthy farmer at Cresswick, N. J., while attempting to stanchion a ferocious bull, was gored so severely that he died on the 30th.....Mr. John Murray of Greenville, N. J., went to his barn on the evening of the 27th to water his cattle. He had not been gone long before Mrs. Murray heard groans from the direction of the barn. She ran out of doors and called her husband's name. There was no reply, except another groan, that unmistakably came from the barn. Mrs. Murray hastened to the barn, and as she approached a ferocious bull bounded out of the stable and ran into the open lot. She found Mr. Murray lying on the stable floor, with his hand upon a wound in his left side. He had been pierced by the horns of the bull so that part of his intestines protruded. Mrs. Murray called for help, and her sons came and aided her to carry Mr. Murray to the house. Dr. Wilkeson was summoned, and the wound was sewed up. He says that three days at least must elapse before he can announce positively whether Mr. Murray is out of danger.

James Hanna and a male companion at a hotel in Stroudsburg, Pa., blew out the gas when retiring and were suffocated.....James Forrister and his wife retiring at the hotel at Indianapolis, blew out the gas. Forrister was found dead. There are no hopes of his wife's recovery..... The clearings of the Associated Banks of Chicago for the month of September were $142,000,000, or or $28,000,000 greater than for September, 1879. The clearings for the nine months ending in September were $1,195,000,000, an increase compared with the same period last year of $343,000,000. Business is lively in every branch and department, and the prospects for commercial activity during the Fall are more favorable than usual during a Presidential campaign.....At Hoboken, N. J., the famous Stevens battery, on which nearly $2,000,000 have been spent, was sold on the 28th to William Laimbeer of New York for $55,000.....The Brush electric light has been introduced in many places in Pennsylvania and Ohio iron mills; New England cotton, woolen and silk factories; Western iron mines, seaside hotels, public parks, Mississippi and Sound steamers, circuses and the streets of two or three Western cities. New York city is to have a headquarters, near Madison Square, from which half a dozen machines will work as many circuits and supply 300 lights. In the district to be illuminated are thirteen hotels, five club houses and many large restaurants and stores. The electric light is used in a few isolated places in Philadelphia.

Boston capitalists have organized a company to continue the Atchison, Topeka and Santa Fe railroad to the city of Mexico.....A lawyer, Horace Wilbur, and his client, Mrs. Lynhall, of Philadelphia, were found drowned at a broken wharf, on the 29th. It is a mooted question whether it was murder and suicide or accidental death on the part of both. No one witnessed the going overboard, and their final end is shrouded in mystery.

INDIAN TROUBLES.

Indian massacres in the far West continue to be reported at intervals. A dispatch from Tucson, Arizona, says two miners report that Gen. Carr had a fight with a small party of Victorio's band, 18 in number, in the Hatchet Mountains, killing them all.....A dispatch from Fort Ellice, British America, dated September 15, says the Stoneys are now following the Mandrills. It seems that the Saiteaux made a desperate resistance, killing 13 of the Mandrills. Ocean Man, the chief of the Stoneys, is among the killed, and a head man of the Saiteaux. Fifteen Stoneys came in Sept. 14, and have gone north, to Riding Mountain, for help. They were in war paint, and came in yelling like demons, with a scalp on a pole. As far as known, 21 have been killed on both sides, and the Indians say the plains are strewn with dead horses and bodies of the slain. The Stoneys were driving the Mandrills so hard toward the boundary that they were leaving the scalping to be done on the return. Thirteen Mandrills had been killed when the runner left. He brought the one scalp as proof of his story, and says he found the brave it belonged to dragging in the stirrup and shot through the heart. He has the dead man's horse and saddle also. The Saiteaux and Stoneys fought all day before they were all killed, and the band of Stoneys now in chase came on their scalped bodies next day.

The influenza, which has for sometime prevailed among horses at Boston, roached New York, and a small percentage of animals among the street-car horses show signs of disease by coughing, but their appetites are not affected; they yield readily to treatment, and a recurrence of the epizooty of 1872-73 is not generally anticipated.....Anna Stroker, aged 17, on trial at Manitowoc, Wis., for the murder of Miss Nancy Heywood, her employer, confessed her guilt to her mother, who visited her, crucifix in hand, and adjured her to tell the truth. The girl, who cannot read or write, repeated the confession in Court, saying that Miss Heywood called her "crazy," which so exasperated her that she pushed her down on the floor and crushed her head with an axe..... ....President Hayes and party are in Oregon.....Epidemic diptheria has caused the schools to close at Bennington, Vt..... ...The Statue of Admiral Farragut, by Mrs. Vinnie Ream Hoxie, was placed in position in in Farragut Square, Washington, on the 29th.... ..Hough's saw mill, furniture store and adjoining stables, Hull's cabinet shop and Hughes' slaughter houses, at Prescott, Ontario, were burned on the 29th. Loss, $15,000; insurance, $6,000.....Frank Beeron, former land agent of the Burlington and Missouri railroad, who perpetrated extensive frauds by selling worthless land certificates, was arrested at Omaha on the 29th.... ....A fire at Fort Dodge, Iowa, on the 27th destroyed the dry goods store of Hall & Julius, the boot and shoe store of Crosby & Co., the hardware store of Prussias and the First National Bank, besides some smaller buildings. Loss, $100,000; insurance, $55,000.

On Sunday, Sept. 19, Mrs. M. Hazzard, wife of a popular and well-known merchant of Monticello, Ill., became the mother of five well formed babies, two of whom were alive at birth. There were four boys and one girl, altogether weighing 19½ pounds. The two living, a boy and a girl, weighed nine pounds, about 4½ pounds each. The remaining boy died in about two days from the time of birth. The mother is rather a delicate woman, about 35 years old, and weighing about 115 pounds. She is getting along as well as mothers ordinarily do under such circumstances. She was the mother of six children previous to this numerous affair. None of her people were ever known to have even twins.....The steam-ship Castello cleared from Savannah, Sept. 30th, for Liverpool with 7,118 bales of cotton, the largest cargo of cotton ever cleared from any Atlantic port..... A fire at Schuylerville, N. Y., on the 30th, burned the following business houses: Oliver Brisbin & Co., E. Washburne, dry goods; J. Horin Brook, hardware; Seth Lawrence, drugs, and the Western Union Telegraph office; Joseph T. Smith, jeweler; Miles Root, furniture; Seward Winney, meat market, and the Schuylerville Standard printing office. The total loss is estimated at $50,000. .....Frederick Billings of Vermont, was on the 28th, elected president of the Northern Pacific Railroad. The stockholders adopted a resolution urging the directors to provide for the speedy completion of the railroad from the western terminus on the Montreal river to Puget sound.

At Wilkesbarre, Pa, September 29, Justice Hoffman pleaded guilty to the charge of murdering his child, and was sentenced to the Eastern Penitentiary for nine years. Hoffman shot at his wife five times in July last and killed a child in her arms.....A skeleton, supposed to be that of a tramp, has been found in the woods near Millerstown, Butler county, Pa.....The clothing of a workman was caught between cogwheels in a mill at Davenport, Iowa, and he was being slowly drawn in, when two comrades grasped his arms, and a desperate "tug of war" ensued. The wheels would not let go, and the men braced and pulled with all their might. The workman was finally rescued, but without a particle of clothing about him.....Jay Gould has paid the travelling expenses from the Indian Territory of 16 young Indian girls who are to be placed in Mr. Moody's Seminary at Northfield, Mass., educated at the Federal expense and returned to their homes.

S. M. Waite was arrigned in Court on eight indictments at Bellows Falls, Vt., and pleaded not guilty to each. He is charged with larceny, forgery and negotiating forged notes. The time of trial has not yet been fixed.....F. M. Shaw, late President of the First National Bank of Paoli, Kansas, which went into liquidation some months since, was arrested at Paoli on the 28th, charged with making false entries in the report of the condition of the bank.....The corner stone of the new State House of Indiana was laid on the 29th, at Indianapolis, with appropriate ceremonies, under the auspices of the State officers and State House Commissioners. Ex-Governor Hendricks delivered the oration.

The famous Oneida Community has purchased water power at Niagara Falls, organized itself into a joint stock company and is now no longer a "community."....Miss Sarah A. Brown, of Lawrence, a Massachusetts girl of mature years, having received the democratic-greenback nomination for county superintendent of schools, will now, it is said, withdraw from the democratic State ticket on which she has been named for the State superintendency.....The ceremony of fastening down the connecting rail in the Northern Pacific railroad extension, between Montana and Dakota, will take place Oct. 5. Two handsome silver spikes have been already forwarded to give the occasion gorgeousness.....The coal hunters at Red Oak, Iowa, are now down four hundred and eighty feet, and think the prospect very encouraging.....It recently cost Harrison county, Iowa, $70 to place a fine of $5 on a man who had bruised and battered a neighbor.....Bishop Hennesy, of Dubuque, will lay the corner-stone of the new cathedral at Keokuk next week.....It is estimated that over two hundred families have moved into Ida county, Iowa, since last March.....The Northwestern railroad will soon build a new depot at Des Moines.....A Lincoln, Iowa, man caused the arrest of of two boys for stealing watermelons. Then he compromised with their father upon payment of one dollar, and coming before the justice to withdraw the case, he was handed a bill of costs for $15.80.....Old Simon Cameron, who has lately been on a visit to Indiana, called on Dr. J. G. Kennedy, in Acton, near Indianapolis, a companion of his youth, but whom he had not met for sixty-two years.....Preliminary surveys for a ship canal from Toledo to Fort Wayne are now being made under an appropriation of $15,000 by Congress.....The body of a woman buried near Indianapolis, thirty years ago, and recently exhumed for removal, was found to be petrified.

A watch factory is projected either at Madison Wis., or Baraboo, and it is said that capitalists of Madison have agreed to take $100,000 stock, while Baraboo, which can furnish by far the best water power, has offered to take $40,000 stock and furnish water power and buildings.....The business of Helena, Ark., for the last twelve months is estimated at $2,500,000. The cotton receipts were 55,000 bales, and it is expected that for the ensuing year 75,000 bales will be received.....Dr. Tanner has been outdone by a Dakota bull belonging to Captain Hadley, of Fargo, which ran off into some woods with a chain attached to his horns, and got fastened to a tree, where he remained six weeks without water or food of any kind; when found he was still alive and happy! .... Near Deadwood a bull leisurely entered a house, probably to get away from the flies. The woman fled in terror and summoned several men, who found the bull in a bedroom quietly chewing his cud, and so well satisfied with his surroundings that it was necessary to twist his tail until it kinked before he would vacate the premises..... At Pala, in Southern California, the anniversary of St. Louis is celebrated by religious ceremonies and bull fights, all under the auspices of the monks belonging to the mission of San Louis Rey. This year a great concourse of Spaniards and Indians gathered. After each day's mass for the week there was bull-fighting in the churchyard. These encounters did not amount to much, but a fight between a bull and a bear proved more satisfactory.....A completion of the census from best sources shows a population fully 50,000,000 in the States and 800,000 in the Territories of the United States.

[La Fayette Journal.]

Such Reports Do One's Heart Good.

Mr. Frank Wilke, North and 9th Streets, stated, that it was not only highly praised by his customers, but the St. Jacobs Oil has not failed to give satisfaction in a single case.

FOREIGN.

The most exciting topic across the Atlantic is still what will Turkey do with regard to surrendering Dulcigno to the Montenegrins. Three or four days ago the Porte asked the Powers to delay until to-day before sending the combined fleet to enforce its surrender. The delay was granted, but no news has yet arrived of the Sultan's final decision. The Ambassadors at Constantinople are most pressing in their efforts to make the Head of the Faithful comply with the wishes of the Infidels, but the Ottoman priests—300 of them—have already besought him not to yield an inch, and they are backed up by all the most pious or bigoted of the Turks. Doubtless the Sultan fears that if he gives way to Europe his own subjects may depose and assassinate him before the Powers could interfere; yet the probability is that he will yield. There is little doubt but that he thought that the combination of the Powers would be broken by the delay, but in this he has been deceived. Christendom cannot now in honor fail to enforce its demands through fear of anything that can be done by the "unspeakable" Turk. If war results, however it may turn out for others, it will certainly be much to the loss of the semi-barbarous Ottoman.

There seems to be a species of "reign of terror" among Irish landlords. A week or so ago Lord Mountmorres—an Irish Lord with no seat in Parliament—was assassinated. He was reduced by his own early extravagance and that of his forefathers almost to poverty, owning only 300 acres, and was grasping and very unpopular as a landlord and magistrate. The English public attribute his "taking off" to the inflammatory harangues of the Irish agrarian agitators, but the latter maintain that the Land League is in no wise responsible for it. Anyhow other landlords are in a "funk." It is as yet doubtful whether the Government will take any severe measures with regard to the island. A couple of men have been arrested for the murder, merely because they had lately been evicted by the dead man; but it is doubtful whether any one will ever be convicted for it—none has ever suffered for the murder of Lord Leitrim some time back, though that caused as great a sensation.

The "news-makers" of England are holiday-making. There is a good deal of talk about several strikes, chiefly among the cotton mills of Lancashire; but as winter is approaching they may not take place. In France the excitement about the religious orders is abating, the Government having decided to act quietly but firmly against them. There is a strong impression that Gambetta is preparing to advocate a warlike policy—against Germany, of course. Public opinion, however, at present is decidedly against any such a policy, although a triumphant war with Germany is the hope and prayer of nine out of every ten Frenchmen. In Italy there is some fear lest old Garibaldi should cause trouble. His son-in-law was imprisoned some weeks ago for taking part in a public demonstration against the government and in favor of a Republic. Garibaldi demanded his release which was refused, whereupon the old warrior left his island home, Caprera, and went to Genoa, some say to attempt to release his son-in-law by force; while others suppose he intends to head a Republican up-rising. The newspapers say, however, that he is too patriotic for that and that he meant nothing at all by his movement—and, of course, they know everything. In South Africa the English have another war on their hands—this time with the Basutos—some killed already on both sides. The main question now in Afghanistan is "Shall Candahar be kept by the British or handed over to their new Ameer, Abdurrahman Khan." The probability is it will be abandoned. Ayoob Khan is on his way to Herat whence he threatens to return and attack Candahar once more. After all, the danger of war between Russia and China is by no means over.

[Cleaveland Plain Dealer.]

Mr. Theodore Hively, tobacco and cigar dealer, 109 Seneca street, was recently laid up with rheumatism so that he couldn't walk. After liberal use of various preparations he purchased a bottle of St. Jacobs Oil, and, to use his own expression, "It was the first thing to afford him anything like relief." He has completely recovered by its use.

AGRICULTURAL NEWS.

AFTER paying all expenses of the late Ohio State Fair, the amount remaining in the Treasurer's hands is $10,208.59.....Reports from 54 central points in the cotton districts of Louisiana, Mississippi, Texas, Alabama, Georgia and Tennessee, giving the condition of the cotton crop to September 24, showed that bad weather damaged the crops in all these States except Georgia.....Of our $824,000,000 of exports of home productions, $680,000,000 consist of the products of agriculture alone, or 82½ per cent. of the whole.....The Des Moines Glucose company has purchased 14 acres just east of the city limits, and will erect enlarged works thereon, with a capacity of 3,000 bushels of corn daily.....The Baltimore grain elevators have a storage capacity of 3,350,000 bushels, exclusive of the several floating elevators. The Baltimore and Ohio railway company are erecting an additional elevator, to be completed in February next, to have a capacity of 1,500,000 bushels.... ....According to Lorin Blodget, the value of the annual wool manufactures are about as follows: Six New England States, $127,500,000; New York, New Jersey, Pennsylvania and Delaware, $93,340,000; Twelve Western States and Utah, $41,200,000; California, Oregon and Washington Territory, $7,250,000; Total, $283,120,000.

The United States Consul at Lyons, France, informs the Department of State that the cereal crop of France this year will amount to 102,000,000 hectolitres, an average yield. Nevertheless there will be a large demand for American wheat. In Germany the cereal crop is a mediocre one, and in Russia somewhat of a failure.....The Virginia State Fair commences Oct. 26, instead of the 22nd as heretofore published.....At St. Louis a proposition to lower the present grades of Nos 1, 2, 3 and 4 red Winter wheat one-half a grade, to take effect Jan. 1, was voted on Sept. 30 by the members of the Merchants' Exchange, and adopted by a vote of nearly two to one. The contest was the most exciting that has occurred on 'Change for several years, and quite a number of the most prominent and influential members of the Exchange took an active part in it.....The net surplus of barley in Canada for export for five years, as indicated by the customs returns alone, has been as follows: Year ending June 30, 1880, 8,133,128 bushels; 1879, 6,077,540 bushels; 1878, 7,851,702 bushels; 1877, 6,520,406 bushels; 1876, 10,074,578 bushels. This is irrespective of stocks held over, either in the hands of farmers or in warehouses, which would not vary the exhibits in any important degree..... The "fly suffocator," an insect resembling the mosquito, is the latest affliction that has visited the Russian peasantry. Last month, in the Mirgorod district of the Poltava province, 1,142 head of cattle, 2 horses, 272 sheep, and 173 pigs were killed by it. The flies are said to enter the air passages of the animals and thus suffocate them. .....In St. Petersburg several suspensions are announced in the grain trade, the liabilities being large. The difficulties are due to shipments from America forcing down prices, after speculators had based their calculations on a deficient harvest in Russia.

It yearly takes 200,000 acres of forest to supply cross-ties for the railroads of the United States. It takes 15,000,000 ties to supply the demand, for which on an average the contractors get 35 cents apiece, making in the aggregate $5,250,000. In building a new road the contractors figure on 2,700 ties to the mile, while it takes 300 ties to the mile to keep a constructed road in repair. The average of a good piece of timber land is 200 ties to the acre and 12 ties to the tree. White or burr oak is considered the best timber for the purpose, although cherry, maple, ash, and even locust have been used. The business gives employment to an army of choppers, who are paid ten cents apiece for each tie. A single man has been known to get out thirty-five ties in a day, yet the average is only ten, while an expert will probably get out twenty.....The peanut crop is estimated as follows: Virginia, 1,600,000 bushels, Tennessee 1,100,000 and North Carolina 2,800,000 bushels. The crop at 22 pounds to the bushels, will make the enormous aggregate of 62,040,000 pounds which, at an average of four cents per pound, would reach the sum of $2,481,600.....We learn from St. Petersburg that the harvest beetle, referred to in a late editorial, which is entomologically called Anasoplia austriaca, is estimated to have destroyed nearly one-third of the Russian crops in the provinces ravaged by it. Not only the South and East, but even the centre of the empire is now attacked. Tauridis, the Don territory, the provinces or Ekartermoslav, Charkof, Pultava and Bessarabia have been visited by the insect with more or less severity. The professors charged by the Government to investigate the matter recommend an abandonment of rye and wheat culture for a time.....Kansas cattle raisers, in order to hinder competition, and prevent the spread of Texas fever among their own herds, had a law passed forbidding the passage through the State, of herds from Texas, but a United States Court has declared the act unconstitutional. .....

THE SALE OF DISEASED ANIMALS.—In the State Circuit Court at White Plains, Westchester County, N. Y., a jury on October 2, decided a suit which is of much importance to farmers and others who sell and buy cattle, horses and other farm animals. This suit was brought by Hiram Finch, a large stock dealer, of North Castle, Westchester County, against Dr. Jonathan Carpenter, of Hall's Corners, Ontario Co., to recover the sum of $900 for five cows sold him and for which he held the Doctor's notes, which were not paid when they fell due. The defence was that the cows were afflicted with pleuro-pneumonia, and that their presence among thirty-five other sound animals caused the disease to spread, so that the defendant lost every cow but two. Mr. Finch denied that the cows had the disease, and a long array of expert witnesses were called in support of each opinion. Their testimony lasted two days, resulting in the ac-

knowledgment that if the disease was not pleuro-pneumonia, it was something very close akin to it. The jury rendered a verdict for Dr. Carpenter giving him $110 damages and the notes for $900, making a total of $1,010. Thus the principle is established by this verdict that a man who sells diseased cattle, and, analogously, diseased stock of any kind, not only forfeits the pay for them but is liable for damages for any spread of the disease due to their presence among sound animals.

The Saturday Review closes a review of the English harvest, as follows: "The farmers must make up their minds to accept low prices, which, however unsatisfactory to them and to their landlords, will be regarded with equanimity and satisfaction by people who are not landowners or farmers. But in the result the depreciation in the value of arable land which has already taken place will be confirmed and generalized. There is nothing in prospect to attract capitalists to invest in farming operations in the grain-growing line."..... All reports from France and Italy agree that the silk crop in those countries will be more abundant this season than for the past ten years.....All along the Atlantic coast and some distance inland, the horse epizootic has already visited nearly all the towns from Boston to half way down between New York and Philadelphia. It does not seem very fatal as yet, however. The following treatment is strongly recommended: as a preventive give the horse twice a day one-third of a teaspoonful of chlorate of potash dissolved in one-third of a bucket of water; for treatment of disease give three doses daily. Feed and water as usual.

DR. R. V. PIERCE: Buffalo, N. Y.:—DEAR SIR—I wish to state that my daughter, aged 18, was pronounced incurable and was fast failing, as the doctors thought, with consumption. I obtained a half dozen bottles of your Discovery for her and she commenced improving at once, and is now well and strong. She took the Discovery last fall.

Very truly yours, REV. ISAAC N. AUGUSTIN.
Shipman, Illinois.

American Carpets.

Manufacturers of Carpets in the United States have within a few years so greatly improved their products, that they are now successfully competing with foreign manufacturers, and the value of the importations of Carpets, in consequence, has fallen off more than one-half.

This result is not attributable to the Custom duties on foreign goods, but rather to the improvements constantly made in design, coloring, finish and texture, until now American Carpets are considered superior to those of European manufacture, in a comparison of their positive wearing qualities, when the cost is taken into consideration.

Among the houses who have done much to produce this result may be mentioned Messrs. J. & J. Dobson, the proprietors of the "Falls of Schuylkill Carpet Mills," who occupy the large and elegant buildings, Nos. 40 & 42 West 14th Street, New York, as a salesroom.

This enterprising firm have just opened their new Fall styles and designs manufactured expressly for their own retail trade, which for beauty of patterns, elegance in finish, durability in wear, and economy in price, compare favorably with anything in the market.

These goods are shown by them in the various grades of Axminsters, Wiltons, Moquets, Velvets, Brussels and Ingrains, and are designed and colored in many instances to harmonize with the prevailing styles in Furniture, Wall Papers and Window Hangings.

Besides their own goods, they at all times have large lines of Turkish and Persian Rugs, Mats and Carpets of the different leading varieties, as well as full assortments of Oil Cloths, Linoleum, Rugs, Mats and Mattings, which they sell at reduced rates.

This store is under the personal management of Mr. John Van Gaasbeek, a gentleman long known and appreciated in the Carpet trade of New York.

Facts vs. Theory.

In regard to the method of coloring butter, the theory is that cows when well fed and cared for will make yellow butter; the fact is that not one in ten will, except in times of flush pasture.

This is just the reason that the very best Dairymen in this country use Wells, Richardson & Co.'s Perfected Butter Color. They warrant it to add at least five cents per pound to the value of white butter, a return of one dollar for every cent it costs.

MRS. LYDIA E. PINKHAM, 233 Western Avenue, Lynn, Mass., is rapidly acquiring an enviable reputation for the surprising cures which daily result from the use of her VEGETABLE COMPOUND in all female diseases. Send to her for pamphlets. Sold by all druggists.

DURING October, the price of the large type edition of the "Library of Universal Knowledge," to all who subscribe and pay in advance, as they commonly do for a newspaper or a magazine, is $20.00 for the 15 octavo volumes complete, in cloth, and $15.00 for the same in half Russia, gilt top. It is a larger Encyclopædia than ever before sold for less than $100.00, besides being the latest, freshest, and in all important respects the *best* in the field, for the general reader.

Why do Hop Bitters cure so much? Because they give good digestion, rich blood and healthy action of all the organs.

Burnett's Cocoaine is the best and cheapest Hair Dressing in the world. It kills dandruff, allays irritation, and promotes a vigorous growth of the Hair.

The Markets.

SPECIALS FROM THE CHIEF CENTERS.

Until Saturday, Oct. 2.

Cincinnati.—WHEAT steady; No. 2 amber, 96c,; No. 2 red winter, 98c. CORN dull but firm; No. 2 mixed, 43c. OATS.—No. 2 mixed, 32½@33½c. RYE in fair demand and firm; No. 2 90c. BARLEY steady, with a fair demand; No. 2 Fall, 95c. PORK unsettled at $17@18.75. LARD firmer at $7.85. Bulk-meats dull; Shoulders, 5½c. Clear Rib. 8¾c.; Clear Sides, 9½c. BUTTER—The bulk of the sales are at 15@20c but choice stock ranges up to 25c. Packers are buying common stock at 14@15c, but it has to be pretty good to command the latter figure. Fancy creamery sells at 32c, and prime at 29@31c; choice Dairy at 24@25c. choice Western Reserve at 22@24c, prime to choice Central Ohio at 18@20c, and common at 14@16c ₱ lb. CHEESE.—The market has ruled stronger at ½c per lb advance, but the demand is only moderate; prime to choice factory selling at 13@13½c ₱ lb. APPLES. Prime to choice at $1@1.25 ₱ bbl on arrival. Inferior are difficult to sell at any price. Home-grown sell at $1.25@1.50 per barrel in prime shipping order, and some fancy stock brings a little more in a small way. POTATOES are in only moderate demand but steady. Prime to choice Early Rose sell at 45@50c ₱ bushel on arrival, and $1.50@1.60 ₱ bbl in prime shipping order from store. Hogs.—Common, $3 85@4.50; light, $4.60@4.90; packing, $4.70.

Boston.—BUTTER.—Northern—Choice creamery, ₱ lb, 30@32c; Choice New York dairy, 27@28c; Choice Vermont, 28@30c; Long dairies, 24@26; Common, 17@19c. Western.—Choice creameries, 29@32c; Fair to good, 26@28c; Dairy-packed, 20@25c; Choice ladle-packed, 20@23c; Common, 17@20c. CHEESE.—Good lots of dairy and factory cheese sell at 12@12½c; fair do. at 11c, and there is not much factory here selling below that price. Fine factory, New York and Vermont, ₱ lb, 13½c; Fine factory, Ohio and West, 12½@13c: Fair to good, 11@12c; Skims, 18@20c. POTATOES.—Northern white are selling at 45c; Northern Rose at 50@53c; Eastern Rose at 55@57c, and Houlton stock at 60c per bushel. Sweet potatoes sold from the boat at $3.50. ONIONS, $3.25 per bushel for Western yellow, and $2.75 for red. FRUIT.—Tomatoes range from 35@50c per bushel box. The market has been flooded with grapes, and prices have ruled at 3c for Concords and Isabellas, and 6c for Catawbas. Cranberries are dull at $4@6 per bbl. Quinces sell slowly at $6 per bbl for choice York State. Pears in good order range from $1.50 to $4 per bushel, the latter price for Seckels. Apples are plenty and sell at $1.25 for choice shipping fruit, and 75c to $1 for common. Choice eating fruit is scarce, and sells for $2 per bbl.

Chicago—WHEAT active and firm; No. 2 Red Winter, 94½@95c.; No. 2 Chicago Spring, 94@94¾c., cash; 94¾c., November; 95½c., December; No. 3 do., 88@89c. CORN steady and firm; 39½c., cash; 40½@40¾c., November; 40¾c., December. OATS strong and higher at 30¾c., cash; 30¾c., October; 30½@30¾c., November. BARLEY firm at 74½c. PORK easier at $18, cash; $18@18.25, October; $12.65@12.67½, November; $12 15@12 20, all the year. LARD fairly active at $7 80@7 82½, cash; $7 82½, October and November; $7 72½, all the year. BULK-MEATS dull and lower; Shoulders, $5 25; Short Rib, $8 05; Short Clear, $8 35. BUTTER—But slight change was observable in any of the features of the market. Sales; 27 sks on p. t., 27 at $5.27½, 182 at $2.34 Clover dull at $4 90.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 2, 1880.

BEANS AND PEAS.—The bean market is quiet. not much animation expected until new arrive regularly and have their customary influence upon the workings of the market. A few new marrows have sold at $1.80; do medium, $1.55@1.60. New pea and white kidney will have a clear field. Red kidney are easy and without encouragement for new; Green peas are dull; higher at the West than here, owing to scarcity of prime. The ravages of bugs have been unusually serious. Sound lots nominal at $1.50@1.55; Southern B. E. peas tending lower; last price $2 per 2 bushel bag.

Marrow beans, prime, $1.62½@1.65; other, $1.50@1.60; mediums, prime, $1.45@1.47½; other $1.35@1.40; pea, $1.55@1.75; white kidney, $1.65@1.75; red kidney, prime, $1.40@1.45; other, $1.30@1.37½.

BROOM CORN.—Now will be quotable next week. Sale at St. Louis new crop 3½c. common, and 6@6½c prime hurl.

BUTTER.—The strong prices that were pressed upon the market had only a short life, the attempt to anticipate the early advance of last Fall having proved a failure. Supplies are larger, as the trade depends largely upon a local outlet. At the close inside prices are chiefly quotable. Dairies are offering, but sales are moderate as the fine lines of some counties will not appear until the weather will not cause a deviation in appearance. At this season a few extra marks of ladle worked extra Western dairy exceed current quotations; some Michigan goes close to State tubs. Ordinary Western is steady when of table merit. Exporters name very low figures, though the market is reported firm abroad.

	Rects. pkgs.	Exp'ts, firkins.
June 1, 1880, to Oct. 1, 1880...	632,383	156,953

BUCKWHEAT FLOUR—Ranges form $2.40@2.75 per 100 lbs.

FRESH FRUITS.—Exports of apples for week, 26,883 bbls.; since Jan. 1, 178 700 do.; same period last year, 92,900 do. The unprecedented Fall trade makes the enlargement. Apples have declined; $1.50@1.52 is very extreme for special selections outside of Gravenstien.

Western N. Y., mixed, ₱ bbl., 75c.@$1: Fall pippins, 75c.@$1: Baldwins in shipping order, $1@1 25: other, 75c.@$1; greenings; 75c @$1, Kings, $1.25@1.37; Twenty Oz., 87c.@$1; Gravenstein, $1.50@1.75; common, 37@50c. Cranberries weak in price with a liberal supply. Cape Cod, fancy, ₱ bbl., $6; poor to choice, $4@5.75; boxes, $3; N. J., prime boxes, $1.25@1.75; poor, $1 $1.12. Quinces show poor quality as yet; extras, $4@5 ₱ bbl.; other, $2.50@3.50. Peaches have a prolonged quotation; extra, $2.50 per basket; other, 75c.@$2. Pears show a lighter offering; prices low but firm; Boston best boxes Bartletts, $3@4; Louise Bunce, B. Diel and B. d'Anjou, $3@4.50; Virgalieu, 3@5; Seckles, choice, $10@12; other, $6@8. Plums about gone crate, $1.25@3 the latter for table sorts. Grapes easy in price but active; Delaware, cases 18 3-lb boxes $2,50@4; baskets ₱ lb 5@7c.; Salem, 4@5c.; Catawba cases, $1.75@2.25; baskets, 3@4c.; Concords, cases, $1.50@2; bulk, 2½@3½c.; Isabella 2½@3c. Peanuts steady at last figures: 4@5½c, as to grade. Chestnuts, $2.25@2.25. New hickory nuts, $2 50.

GRAIN.—Wheat has been active, the exports for the week reaching 2,020,000 bushels, with the market ruling higher most of the week through the threatening situation of affairs in the southeast of Europe, but closing easy.

The latest prices are of No. 1 white at $1.09½@1.10; do. October, at $1.08¾@1.08¾; do. November at $1.18¾@1.08¾; No. 2 white at $1.07¾@1.07¾; ungraded white at $1.06@1.12; No. 1 red at 1.13@1.14; No. 2 red at $1 08¾@1.08¾; do. October, at 1.08½@1.08¾; do. November, at $1.09½@1 10; December, at $1.11@1.11¾; No. 3 red at $1.07@1.07¾; do., steamer grade, at $1.01; ungraded red at $1.03@1.11: No. 2 Milwaukee spring new, at 1.08: No. 2 Chicago spring, old at $1.07¾ afloat. Rye is at 95@96c. for No. 2 Western. Corn is fairly active and strong; the exports for the week have been 1,050 000 bushels; latest prices are for New York No. 2, at 51¾c.; do., October, at 51¾@5 ¾c.; do, November, at 52½@53c; do., December at 53¾@54¾c.; ungraded mixed Western at 51¾@52¾c. Oats are unsettled, closing weak; latest sales are of No. 1 white at 43@43¾c.; New York No. 2 white at 42¾@42¾c.; do. for October delivery, at 40c. bid and 40¾c. asked; No. 3 white at 40@41c. New York No. 1, 42½c. No. 2 at 41¾@42¾c.; do., October quoted at 39¾c. bid and 39¾c. asked; do., November at 38¾c, do. December at 38c. bid and 38¾c. asked; No. 3 at 40@40¾c.; ungraded White Western at 40@41¾c.; ungraded mixed Western at 38¾@42¾c.; white State at 42@45¾c.; mixed State at 42½@43c.; No. 2 Chicago at 42@42¾c.

HAY AND STRAW.—There is a good demand and a firm market.

Shipping hay quoted at 80c.; medium to prime do., 90c.@$1.15; salt hay at 60@65c.; clover do. at 65@75c. Straw at 90@95c. for long rye; 65@70c. for short rye; and 60@70c. for oat.

Yearlings, crop 1879, choice	20 @25
Olds, all growths	4 @14

POULTRY AND GAME.—Supplies of dressed are running uneven. At this season the market always suffers from the sending in of rough lots and prices are somewhat unsteady.

Turkeys, choice, 13¾@13c., ₱ lb.; fair to good, 11@12c; Phila., dry-picked, 14@15c. Chickens, do., 16@17c.; Bucks Co. do. 13@14c.; State scalded, 12@13c.; Western, scalded, 11@12c. Fowls, Phila., dry-picked, 13½@14½c.; N. J., d.-p., 12@13c.; scalded 12@12½c.; State, scalded, 11@12c; Western, scalded, 10c.; poor, 9@10c. Ducks, Spring d.-p., 15@17c.; mixed, 11½@13c. Geese, Phila. Spring 15@16c.; fair, 11@13c. Squabs, white, ₱ doz., $2.25@2.50; dark, $1.12@1.25.

Live poultry ran down so low for a number of days that shipments abated. Good lots are in demand and common thin stock irregular.

Chickens, New Jersey, per lb 11@12c.; State, 10@11c; Western, 10@11c.; Southern, 10@11c. Fowls, New Jersey, 11@13c.; Western, 10@11c.; Southern, 10@11c. Roosters, 4@5c. Turkeys, young, 11@13c.; old, 9@11c. Ducks, choice, 55c.; other, 40@50c. Geese, choice, $1.75; other, $1@1.50.

General trade for game opens slow; the weather prevents display. Venison arrives in bad condition. For all birds there is an easy tone.

Mallard ducks, 40@50c.; teal, wood and common 20@35c. Partridge, prime, $1 00; soft, 40@75c.; grouse, 90c.@$1: woodcock, 50@85c.; Eng. snipe, ₱ doz., $1.50. Sand snipe, 40c.; plover, $1.50; wild pigeons, flight $1.50: stall-fed, $2.25; venison short saddles 16@20c.; whole deer, 10@12c.

PROVISIONS.—There has been a slight speculative movement which has carried prices up sharply, and pork especially taking attention.

Mess pork at $20.25, buyers' option this month. Bacon at 8-70c. for long clear, and 9c. for short clear. Lard—Western steam at 8.85 for spot lots; 8 30c. for Oct; 8-22½@8.25 for Nov., and 8.20@8.22½c. for Dec. Strealine at 8 9.16@8 11.16c. Tallow at 6¾@6 7-16c. for prime. Beef hams at $16.50. Beef—extra India mess quoted at $19@20 for city; $9.50@10 for extra mess, and $9 00 for plain mess; $10.75@11.75 for packet, and $12@13 for family mess.

Receipts for week, beef, 422 pkgs.; pork, 1,800 bbls.; cut meats, 27,709 pkgs.; lard, 5,315 pkgs.

Exports for week, beef, 1,700 bbls.; pork, 2,675 bbls.; cutmeats, 3 089,903 lbs.; lard, 4,378,735 lbs.

SEED.—Timothy is strong at $2.70@2.80, Clover is quiet at 8¼@8¾c. for prime to very choice.

Receipts for week, 3,336 bushels.
Exports for week, 894 bags.

TOBACCO.—There is a brisk export demand and a fair home trade, with prices well sustained.

LIVE STOCK MARKETS

NEW YORK, Saturday, Oct. 2, 1880.

BEEVES.—Receipts for the week 14,817 head; do. last week, 12,749 do. An overstocked market depressed prices, and the yards were not cleaned at the close. Cherokees and Texans sold at 5@7¼c.; Coloradoes, 7@8c., though a few pretty fed of the latter brought 8¼c.; poor to fair native steers, 7 9c., to dress: 4@56 lbs.; good to choice, 9¼@10¾c., to dress 56@57 lbs.; extras, 10¾c. These prices are fully ¼c. off since Wednesday. Exporters wants were limited and a blue opening is looked for on Monday.

COWS AND CALVES.—This usually neglected market is quite firm at late rates, but there is no inducement for large receipts; range, $30@60 the latter for singles.

VEAL CALVES.—Prices are regarded high at the close; sellers look for an early change, especially as dressed will soon be a feature.

Live calves, N. J., fed, 7¼@7¾c.. State choice, 6¾@7½c.; good, 6@6½c.; poor, 4½@5½c.; Mt Holly, large, 5@7c.; buttermilk, 3@3½c.; grassers 1½@2½c.; fair to prime hog dressed 7@10c.; common, 3½@5c.

SHEEP AND LAMBS.—Receipts for week, 38,538 head; do last week, 35,189 do. Sheep quiet prime lambs in good demand. Very common sheep, 3½c.; good to prime, 4@4½c. Lambs, 5@6c., a few extras at $6.20 ₱ 100 lbs.

SWINE.—Receipts for the week, 27,529 head: do. last week, 25,934 do. Late quotations for live, $5.10@5.50; country dressed pork, 7@8c.; heavy to light N. J. city dressed and State, 7@8c.; do. Western, 6¾@7½c.

Reading for the Young.

SONGS FOR CHILDREN.

A. B. C.

THREE bright little boys
Took their A B C's,
And planted them deep,
So they grew into trees.
All the trees bore fruit,
When the boys grew up,
And knowledge poured joy
To the brim, in their cup.

JUMPING-JACK.

Jumping-Jack, Jumping-Jack, where shal we go?
Out in the garden to dig with the hoe;
To dig for potatoes and dig for red beets,
And dig for whatever the little pig eats!

Jumping-Jack, Jumping-Jack, where shall we sleep?
Under the hay with the black chimney-sweep.
Jumping-Jack, Jumping-Jack, what shall we wear?
Pantaloons made out of Nanny-goats' hair.

Jumping-Jack, Jumping-Jack, where were you born?
In the small end of a little cow's horn.
Jumping-Jack, Jumping-Jack, where will you die?
Under the rim of a gooseberry pie.

—Mendel in N. O. Democrat.

OUR NUT-BEARING TREES.—No. 1.

MAUDE MEREDITH.

ONE of the pleasantest sources of amusement to the young folks is the gathering of a store of nuts for the Winter evenings. The presence of nut-bearing trees is also one of the delights of farm life of which too little thought is given. It is a simple thing to plant a few hickory nuts, butternuts, black-walnuts or chestnuts in a convenient place in the Fall, and with a little protection from cattle, see them grow into fine, shapely trees. Yet how few do it? How is the nutting season of old New England times neglected?

The greater proportion of nut-bearing trees belong to the genus Juglans, from the Latin Jovis glans, the nut of Jove, these, together with the hickories, carya, make up the walnut family. Added to these are the beech-nut, the chestnut and some small shrubs like the hazel bushes.

On the prairies of the West, where the rapidly growing cottonwood and Lombardy poplar are set as wind-breaks about buildings, the different varieties of nut trees might be planted, as they are of rapid growth, though a little particular as to food material, preferring for growth a deep loamy soil, dry rather than moist, but the fruit has the best flavor and produces the most oil, when the tree is grown in calcareous soils, or among calcareous rock. In a wet-bottomed soil, no matter what the surface, it will not thrive.

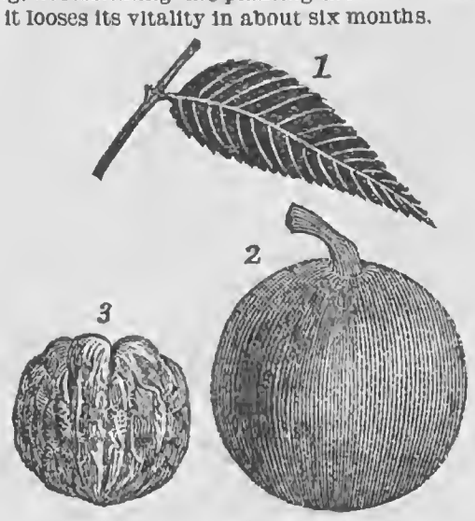
In referring to different branches of the walnut family, the Juglans regia, or European walnut, commonly called English walnut in our market, will perhaps take the precedence, although not strictly speaking, an American tree, being a native of Asia. It grows abundantly throughout Europe, but in this country it ripens its fruit only south of the latitude of Washington. In Europe much attention is given to its cultivation, and about a dozen varieties are known, distinguished by the abundance, size or shape of the fruit, the thinness of the shell and quality of the kernel. These are propagated by grafts upon budding stocks. The sap of this tree (like those of our species) contain sugar and has been used in some countries as a source of that product; and is sometimes concentrated and fermented to make walnut wine.

Where this tree abounds, large quantities of the nuts are pressed, for their oil, which is used for food the same as olive oil, the residue being used by artists and in the finest kinds of printers ink. The fruit is in great demand throughout Europe for table use as a food by the poorer classes, a dessert by the rich. While green it is sought for the purpose of preserving or pickling, when ripe as an article of export also. But leaving our foreign cousins for members of the American family proper we find the black walnut J. nigra as ranking first in importance, principally, at present, for the value of its timber, in the manufacture of furniture there being few homes in all the land that do not contain articles of furniture made from its strong, beautiful wood; being very hard fine-grained and susceptible of a high degree of finish. When first cut it is a purplish brown, but with age turns very dark, almost black.

The tree itself, is very stately growing from 60 to 150 feet in hight, growth remarkably rapid and at the age of eight to ten years it begins to bear, though age increases its productiveness. It is found, more or less in forests from New England to Florida, but is much less abundant east than west of the Alleghanies, where, especially in the valley of the Mississippi it is one of the commonest trees. When in the forest it has a clear trunk 30 to 50 feet without a branch, but in open ground it branches rather low forming a wide spreading head. There is a specimen standing on the grounds of the late William Cullen Bryant at Roslyn, L. I., the seed of which was planted in 1713; at three feet from the ground it measured 25 feet in circumference. The fruit is spherical, the surface of the husk a greenish yellow when ripe, and nutting parties can hardly imagine a more pleasing sight than the long vistas of brown wooded way, clear of low limbs or underbrush, as no tree or grass will grow in the shade of the walnut, the brown earth dotted or heaped in little colonies with the great yellowish globes, near in size and shape to a medium sized orange, and the soft thud, of nuts all the time increasing the store already fallen.

All along the Mississippi of a fine Autumn day may be seen the single express, or open buggies from town or farm starting for neighboring groves for a days pleasure of nutting, taking along their picnic lunch, perhaps a book and hammock also, but certainly a quantity of sacks to bring back the winter's stock of walnuts. The rind soon turns black, and with very little time or trouble may be taken off or if left will dry down and drop apart when the nut is cracked.

The nut has a corrugated, hard shell, with an oily kernel, which becomes rancid if kept too long, necessitating the planting the same season, as it looses its vitality in about six months.



BLACK WALNUT.—FIG. 326.

In the tree planting districts of the west, the nuts are gathered into heaps covered, with straw and earth to keep out the rain, and in Spring are planted where the trees are to stand. A better way is to plant directly, in the Autumn where the trees are expected to remain, for like the lemon and orange, most nut-bearing trees are tap-rooted, and therefore do not bear removal.

If necessary to sprout in little nurseries, a flat stone should be placed some six or eight inches below to give the root a horizontal bent, until time for removal.

PANAMA HATS.

PANAMA hats are principally manufactured in Veraquas and western Panama. Not all, however, known to commerce by that name are plaited in the Isthmus, by far a greater proportion being made in Manta, Monte Christi and other parts of Ecuador. The hats are worn almost in the whole American continent and the West Indies, and would probably be equally used in Europe did not their high price, (varying from $2 to $2.50) prevent their importation. They are distinguished from all others by consisting only of a single piece, and by their lightness and flexibility. They may be rolled up and put into the pocket without injury. In the rainy season they are apt to get black, but by washing with soap and water, besmearing them with lime juice, or any other acid, and exposing them to the sun, their whiteness is easily restored.

So little is known about these hats that it may not be out of place to give an account of their manufacture. The "straw" (paja), previous to plaiting has to undergo several processes. The leaves are gathered before they unfold, all their ribs and coarser veins removed, and the rest, without being separated from the base of the leaves, is reduced to shreds. After having been exposed to the sun for a day, and tied into a knot, the straw is immersed in boiling water until it becomes white. It is then hung up in a shady place, and subsequently bleached for two or three days. The straw is now ready for use, and in this state sent to different places, especially to Peru, where the Indians manufacture from it those beautiful cigar cases which sometimes bring as high as $30 each. The plaiting of the hats is very troublesome. It commences at the crown and finishes at the brim. The hats are made on a block, which is placed upon the knees, and requires to be constantly pressed with the breast. According to their quality, more or less time is occupied in their completion—the coarser ones may be finished in two or three days, while the finest may take as many months. The best times for plaiting are the morning hours and the rainy season, when the air is moist. In the middle of the day and in dry, clear weather, the straw is apt to break, and this, when the hat is finished, is betrayed by knots, and much diminishes the value.

BONNY.

BONAPARTE is the name of a very intelligent horse that is owned by Col. H. James, of the town of Urbana, in the State of Ohio. One of Bonny's peculiarities is that he will not bear to be hitched. Whenever any one ties his bridle-strap to a post he quietly and deliberately breaks the strap, but at the same time does not think of running off. He will stand by the post until wanted. Bonny has a different gait for each person who drives him! If he sees the young son of Col. James get into the buggy, he starts out at the top of his speed. If the little girls get in he will jog along as gently as he can, fearing, no doubt, that some harm might befall his passengers. He knows when Sunday comes, and if hitched to a carriage will trot soberly and religiously to the meeting-house, without being directed by the bit. One day recently his feet became sore because his shoes were worn. Pat, the stable boy, who has long believed that Bonny knows more than many men, took two shoes, tied them together with a string, shook them before Bonny's face and hung them across Bonny's neck. Bonny understood. Without a word from Pat he trotted out of the gate and went directly to the blacksmith shop, a long way off, where he had been shod for twenty years.

LETTERS FROM THE COUSINS.

MY DEAR RURAL COUSINS:—I think Uncle Mark, bless his kind heart, rather dared me to tell you all about him and now I'm just going to do it. I'll tell you how it happened. Mamma and I were riding down Broadway in one of those funny stages, and we came to a pretty park and such a big, big grand building. Mamma said it was the Post Office, but I never saw such a nice, lovely place before, and looking right past that we saw the name RURAL NEW YORKER, on another building, and I thought it would be lovely to go in and see Uncle Mark, so Mamma pulled a little strap to let the driver know we wanted to get out, and when we got down the little steps at the back of the stage, there were so many teams we could not stir, then a policeman came along and walked across with us. I guess the drivers are afraid of blue coats and brass buttons, for they never drive over them, but I think they would drive over me if I did not dodge.

When we went up a flight of stairs we saw the office door and when a man opened it we called for "Uncle Mark." "Oh, yes," he said, "he is in," and took us into an outer office and gave us seats and then went and spoke to Uncle Mark. Now I know you all want to know how he looked when he came in. (What if he should pull my ears if I tell you?) He has black hair cut short and the prettiest brown moustache, I like that, 'cause you see my papa wears one, and a man don't look old and cross like some men do that have lots of whiskers. His eyes are blue, and the laughingest, twinklingest sort of eyes you ever saw.

He was real pleasant and said he liked all his little neices and I guess he does, any way *I* liked *him*. He looked so young and so full of fun that I wanted to tell him all about my doilies—I've only five left—and the kitties and bird, and the goldfish and soft-shell turtles, and lots of things, but I didn't have time. Mamma said afterwards that he was older than he looked, she knew, else he couldn't be uncle to so many children, I 'spose.

Guess I'll have to send Florence a little piece of quartz I got while on a visit to my aunt's in Vermont this summer.

If this finds room—out of the waste basket—Mamma says a waste basket is a very charybdis, I'll tell you about a little girl I saw in Chicago, all alone there. Yours truly,

Dubuque, Iowa. GEORGIA G. SMITH.

DEAR UNCLE MARK:—I have been so dilatory about writing to you I hardly know whether you own me as a member of your club any more. I received those seeds you sent last Spring and now have some beautiful flowers from them. The China Pinks especially are most beautiful. The ockra came up and did well, but our folks do not care much about it. May be they do not know how to cook it just right. We have many beautiful flowers now, both in the yard and greenhouse. We have one abutilon of the Mesopotamian variety that has been in bloom ever since last February, and now has not much less than 100 buds and blossoms on it. Good bye. LETHA ABBOTT.

Clermont Co., Ohio.

DEAR UNCLE MARK:—I am a little boy five years old. I cannot print very well yet, so I will get mamma to write this time. I want to tell you about my fox. I had a fox, and his name was Charley, he got loose one night and tried to get our chickens. I caught him once, but he scratched me, so I had to let him go; and when papa came home from Mr. Collins', he could not catch him, so he took his gun and shot poor Charley. He skinned him, and stretched the skin out on a board and put it in the woodshed; then he took it to town and sold it. I cannot read, but I know my letters. I learned them from my spelling blocks that Santa Claus brought me last Christmas. I have no brother or sister to play with, but I have a big dog named Jack. SEYMOUR A. AYRES.

Michigan.

DEAR UNCLE MARK:—I will write and thank you for the seeds you sent me last Spring. Most of them grew and bloomed very nicely, considering the dry weather. My okra did better than anything else, but father had plenty of that before. My Surprise melon was splendid. I saved all the seed from it to plant next year. I read all the letters from the cousins. I like to hear from them. Father says I may meet some of them sometime. I hope I shall. It has been very dry for a long time, but now we are having lots of rain; but I am afraid this letter is too long now, so I will close. Your little niece, VIOLA GRACE DILLE.

Kansas.

DEAR UNCLE MARK:—You must think us very ungrateful for not thanking you for the seeds which you were so kind as to send us. Our seeds all grow nicely. We have 15 nice vines of the Surprise muskmelons and 11 plants of okra. The flowers are in bloom and are really very pretty. Mamma has Mold's Ennobled oats, some of the heads of which measure one foot in length. Her Golden mangels are perhaps not so large as some others, the largest being about six inches through. Greetings to all and thanks to Uncle Mark.

ROBERT, EDWIN and ANDREW GUFFIN.

Johnson Co., Iowa.

DEAR UNCLE MARK,—My China pinks are growing nicely, and I have a great many different colors. My portulucas, phlox, drummondii, Sweet mignonette and Surprise muskmelon come up very well. My okra came up very nicely. I have a nice bed of gladiolus, and I have some nice balsams and pansies, too, and I have a nice row of watermelons. We have had a ripe melon and it tasted very good. MARY E. WILD.

Ottumwa Co., Mich.

DEAR UNCLE MARK:—I should like to join the Horticultural club and become one of the cousins if there is room for one more. We moved from New York State to Virginia. We live three miles from Richmond. I like it very much here, I can raise such good watermelons, and muskmelons, and peanuts, and sweet potatoes. I have not many flowers this Summer. Yours truly,

Richmond, Va. ALICE CAREY.

Sabbath Reading.

BREAD UPON THE WATERS.

'MID the losses and the gains;
'Mid the pleasures and the pains,
And the hopings and the fears,
And the restlessness of years,
We repeat this promise o'er—
We believe it more and more—
"Bread upon the waters cast
Shall be gathered at the last."

Gold and silver, like the sands,
Will keep slipping through our hands;
Jewels, gleaming like a spark,
Will be hidden by the dark;
Sun and moon and stars will pale,
But these words will never fail,—
"Bread upon the waters cast
Shall be gathered at the last."

Soon, like dust, to you and me,
Will our earthly treasures be:
But the loving word and deed
To another in his need,
They will unforgotten be!
They will live eternally—
"Bread upon the waters cast
Shall be gathered at the last!"

Fast the moments slip away,
Soon our mortal powers decay,
Low and lower sinks the sun,
What we do must soon be done;
Then what rapture if we hear
Thousand voices ringing clear—
"Bread upon the waters cast
Shall be gathered at the last."

MORNING STUDY OF THE BIBLE.

THE best time for Bible reading is in the morning. The mind and body are fresh, after the repose of the night, and the highest powers of thought may be brought to bear upon the chapter selected. But, with most people, each recurring morning brings its own pressing tasks. Business cares, the daily toil, and the duties of the household, are the first and most engrossing concerns. Some hours must pass, with many, before they can find time to sit down to any quiet reading.

I would plead, however, with every one who may happen to look at this article, that the plan be honestly tried, of taking some words from God's book for the first meditation of the morning. If you have a fire to light, or breakfast to prepare; if you must hurry forth in the early gray of dawn to take down shutters and sweep out a shop; if you must hasten to dress the little children, or start off for a long journey to the store you attend, or the school in which you teach, or the factory where you toil, still you will be wiser, richer, and happier, if you are resolute about this.

But to the multitude whose mornings are comparatively within their own control, I would say, make for the next month a fair, steadfast trial of the plan of studying the Bible when your faculties are at what MacDonald somewhere calls "mental high-water mark." Very often there is pressing work on hand; the little dress must be finished, the cake must be made, the dinner must be ordered, the sweeping must be attended to, the letters must be written, and the newspaper must be read. By-and-by will do for the Bible reading. Thus we argue, and before we know it noon comes, guests arrive, unexpected affairs crowd upon us, and there is no room for the still hour with God, for the sweet preparation of the heart to seek him.

Every Christian admits the duty of frequent reading of the Bible. To how many is it more than a duty, even a dear and thrice precious privilege, that they are ready to cry, "how sweet are Thy words unto my mouth, yea sweeter than honey unto my taste!" This experience comes only to those who make it part of their life's work to study the Scriptures. You wonder at the familiarity of this or that friend with the Psalms, the Epistles the Gospels. It has been gained a little at a time, by patient daily reading, thoughtful and prayerful reading, too, which was hived by the soul as something worth treasuring. We shall all gain immeasurably in our influence, as well as in our own comfort, by giving more of our unwearied thought to the Holy Book. A few tired, sleepy, worn-out moments at night, and those only, are almost an insult to the Master whom we profess to serve.—Presbyterian Journal.

THERE is no hurry in eternal things. We must indeed run to do the commandments of God, but we must run cautiously, and look about us while we run. If we are not slow we shall miss things. We shall miss seeing God, and miss hearing Him, also. We can hardly be reverent unless we are slow.—F. W. Faber.

IT must be confessed that there is a great deal of preaching about God which is neither helpful nor edifying. As long as the pulpit deals in cold abstractions, there will be no kindlings of devotion no glow of spiritual life. The people are thirsting for God—for *the living God*.—B. D. Thomas.

LIFE has such hard conditions that every dear and precious gift, every rare virtue, every pleasant faculty, every genial endowment, love, hope, joy, wit, sprightliness, benevolence, must sometimes be put into the crucible to distil the other elixir—patience.

JEREMY TAYLOR says: "If Christians must contend, let it be like the olive and the vine, which shall bear most and best fruit; not like the aspen and elm, which shall make the most noise in the wind."

WE do not become righteous by doing what is righteous, but having become righteous we do what is righteous.—Luther.

PERSONAL ITEMS.

When President Lincoln was asassinated in 1865, his family being left in needy circumstances. the late Marshall O. Roberts quietly sent Mrs. Lincoln $10,000 as his contribution toward a proposed fund of $100,000.

Senator Burnside tells this story at the expense of his colleague, Senator Anthony. They were dining together one day when ham formed one of the dishes. "If I ever turn farmer," said Mr. Anthony, "I shall raise plenty of calves, so that I can get some nice hams like this."

A remarkable woman, Mrs. Mary Ann Dean, died lately in St. Louis. She was 37 years old, and had been married 20 years. She was the mother of 21 children, of whom there were three pairs of twins, two sets of triplets, and four were born at one birth. Ten of her children are living.

In spite of the denials, the statement proves to be authentic that the engagement between Ulysses Grant, jr., and Miss Flood has been broken off. The young man was seen walking with a girl that was not very "nice," and Miss Flood broke off the engagement—loss to Young Grant $2,000,000, certain chances, and a handsome, spirited wife.

Of the present Administration, Mr. Gladstone, Mr. Foster, Mr. Mundella, Mr. Bright, Mr. Chamberlain, and Sir Charles Duke, are Radicals, and three, or even four—some say the whole six—are Republicans. It is not so very absurd an impression, therefore, that there is a veiled sympathy on the Treasury bench for the crusade commencing in England against the hereditary legislators.

Mrs. Susan J. Henry, widow of the late Captain Patrick Henry, last surviving grandson of Patrick Henry, of Revolutionary fame, died a few days ago in Washington. Mrs. Henry inherited property which was lost during the war. For a number of years she was a clerk in the Treasury Department, and at the time of her death had just received an appointment in the Agricultural Department.

The late Amelia Frances Wood, of Boston, bequeathed $3,000 to the Channing Home there, $1,000 each to the Mass. Homœopathic Hospital, the Young Men's Christian Union, the Free Hospital for Women, the Children's Mission to the Children of the Destitute, the American Unitarian Association, the Children's Hospital and the Humane Society, and $500 to the Society for the Prevention of Cruelty to Animals.

Sir F. Roberts, the conquering hero of Candahar and so-styled "Savior of Afghanistan," is son of a clergyman of the Established Church in Waterford, Ireland. His brother, Samuel U. Roberts, is one of the Commissioners of the Board of Public Works in Ireland. Sir F. Robert is a member of the order of Good Templars and a staunch teetotaler. He has a Good Templars attached to every regiment under his command. Sir Gardet Wolseley is also a total abstainer.

W. H. English, the Democratic candidate for Vice-president, is a man standing about five feet nine inches high in low-cut unbuttoned gaiters. His head would be bald but for an ingenious, though not an entirely ingenous combing of his side hair, and is well shaped for business. He has a shelving forehead, a clear gray eye, full dyed beard, and red socks. He wears perhaps, two inches too short, brownish vest, no watch and a silk cravat, with the knot nearer his ear than his windpipe.

Prompt Action of Compound Oxygen in Lung Diseases.

The promptness with which Compound Oxygen acts in *throat and lung diseases* is very remarkable. Mrs. Alice A. Daniels, of Ramsey's Station, Alabama, sends, without solicitation, and for publication, a statement of the results of its use in her case, from which we make a single extract. She says, "*In four days after commencing to inhale the Compound Oxygen, chills, fever, and night-sweats were all gone!* My appetite, which before was at its lowest ebb, soon became good. My strength increased very rapidly, and improvement has been steadily going on ever since the first inhalation. My cough slowly became milder, and to-day I can truthfully say that I am almost a well woman." Send for our Treatise on Compound Oxygen. It will be mailed free. DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

Miscellaneous.

DAY'S Kidney PAD

A CURE for the most prevalent and fatal diseases that afflict mankind **FOUND AT LAST.** Internal medicines never did nor never can cure **KIDNEY DISEASE. STOP IT NOW;** apply Day's Kidney Pad **AT ONCE,** and be cured of all affections of the **Kidneys, Bladder and Urinary Organs.** It is the only treatment that will cure **NERVOUS AND PHYSICAL DEBILITY,** and that distressing complaint, **"BACK ACHE."** It will annually save many times its cost in medicines and plasters, which at best give but temporary relief. Sold by Druggists or sent by mail on receipt of price, **$2.** Our book, "How a Life Was Saved," giving a history of this new discovery and a large record of most remarkable cures, sent free. Write for it.

DAY KIDNEY PAD CO., Toledo, O.

$5 to $20 per day at home. Samples worth $5 free. Address Stinson & Co., Portland, Maine.

A. W. GRAY'S SONS,

Middletown Springs, Vt.

☞ Will produce more income than many farms do.

Do not fail to Send for Illustrated Circular Before Buying.

☞ Every Machine guaranteed as represented.

☞ Circulars free. Address as above.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Implements and Machinery.

WATCH BUYERS, ATTENTION

The celebrated Borel and Courvoisler Watches were awarded the first prize in London in '62, grand prize at Paris in '67, first prize at Centennial in Philadelphia, and lastly gold medal at Paris in '78. These watches have stood the test for the past 20 years, and pronounced by best judges equal to any made. They all have Nickel Movements, Tempered and Hardened Breguet Hair Springs. Ischronized for railroad use in Key and Stem Winders, with all modern improvements in the art of watch making. Large numbers are in use on the principal railroads in the country. As a guarantee that they are what we claim for them, we refer by permission to the dealers named below who have sold them for years:

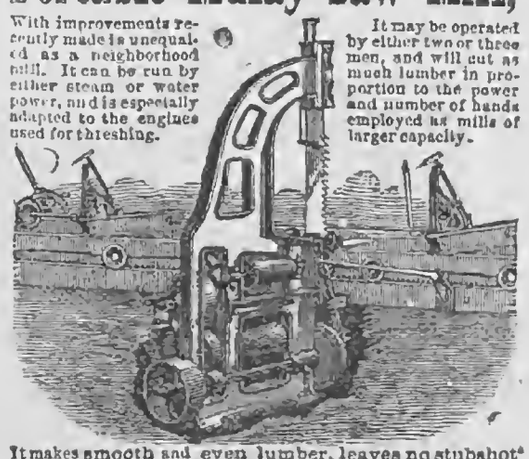
Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.



It makes smooth and even lumber, leaves no stubshot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc., to CHANDLER & TAYLOR, Indianapolis, Ind.

USE ONLY THIS THE FIRST AND THE BEST

Humorous.

MR. YOUNGWOMAN wants to know "what is the best way to mark table linen?" Leave the baby and a blackberry pie alone at the table for three minutes.

A MAN in Iowa has been arrested for assaulting his own wife, and he has been found guilty, even though it was shown that he only stuffed her mouth full of putty when he wanted to go to sleep. Do men have no rights at all?

"I'D have you know," exclaimed Mrs. Uppakrust, haughtily tossing her head, "that my family always moved in the upper circles." "Yes," whispered Mrs. Blunt to her friend Sarah Jones, "I've hern tell that the scum allers rises to the top."

"WELL, Ethel, dear," said an uncle to his little five-year-old niece, "if you like your new toy, come and put your arm around my neck and give me a kiss." The little maiden complied, but as she did so, she remarked: "Oh, uncle, how I do spoil you!"

"ANY letter for me?" asked a young lady of the female postmaster, in a country town. "No," was the reply. "Strange," said the young lady aloud to herself as she turned away. "Nothing strange about it," cried the f. p., through the delivery window, "you ain't ans'ered the last letter he writ ye!"

"WRITE carefully," says De Quincey. "You can never tell how much good your work may accomplish." No truer words were ever spoken. A man brought around a perfectly lovely poem about the sun-kissed leaves of September, yesterday, just as the office boy had built a fire in the grate and was looking for something to light it with.

"Bob Brown, did you say that my father had not as much sense as Billy Smith's yellow dog?" "No, I never said any such thing. I never said that your father had not as much sense as Billy Smith's yellow dog. All I said was that Billy's yellow dog had more sense than your father; that's all I ever said." "Well, it's well you didn't say the other, I tell you."

Johnny wanted to go to the circus and his father said: "Johnny, I'd rather you'd go to school and study, and may be you'll be President some day." "Father," said Johnny, "there's about one million boys in the United States, isn't there?" "Yes." "And every one of them stands a chance of being President?" "Yes." "Well, dad, I'll sell my chance for a circus ticket."

AN Irish nobleman, riding along a country road in Ireland, saw a very fat boy dozing by the roadside. "Which is the way to Macroom, my lad?" asked the nobleman. "That way," replied the boy, lazily moving the toe of his boot in the direction of the place. Astonished at his extreme laziness, my lord dismounted. "Boy," said he, "if you can show me a lazier act than that I will give you half a crown." The boy eyed him speedily for a moment, and, turning half over on his side, muttered: "Put it in my pocket, sor." He got his half-crown.

A LEAP YEAR INCIDENT.—Not a hundred miles from Thornhill a young lady had been spending the day with a bachelor minister and his sister. The young lady, whose name was Miss Hope, had been very gratified with the kindly treatment received at the good old Scottish manse, and on leaving expressed her thanks for the kindness of the minister, making at the same time the remark, "That she had not heard him in the pulpit; but" she continued, "I will be over on Sabbath to hear you"—"I shall be very glad to see you, Miss Hope, and under the interesting circumstances you might suggest a 'text' for the occasion, and I will do all the justice to it I can."—"I will be glad to do that, sir" replied the lady. "How would this one do—'Lay hold of the 'Hope' set before you?'"

Tarry Not

until you are driven to the verge of distraction by a disordered liver, but as soon as the organ turns mutinous, discipline it with a course of Hostetter's Stomach Bitters, an anti-bilious medicine which ensures active secretion by the liver, and a regular habit of body. Pains through the right shoulder-blade and ribs, vertigo, nausea, coating of the tongue, constipation, and sick-headaches, which are all incidental to biliousness, are promptly remedied by this active and thorough specific. As a remedy for debility it cannot be surpassed, strengthening the stomach and promoting digestion, enriching the blood, and invigorating the nerves. It protects the system against malaria, and cures the disease in its various forms radically—it overcomes a tendency to rheumatism, remedies disorders of the kidneys and bladder, and expels impurities from the circulation.

Industrial Topics.

TEA CULTURE.

CONSIDERABLE space is this week given to illustrations of the cultivation and curing of the tea-plant in the East Indies. Tea culture is not an established paying industry in the United States, as yet, but there is a considerable number of tea plantations where the plant has been growing for several years, and the feasibility of developing the industry is at least promising.

As a *resumé* of what has been done in the United States, chiefly in Georgia and South Carolina, in tea cultivation, we give the statement of General LeDuc, Commissioner of Agriculture, with reference thereto as made to us.

"The tea-plant had been grown and distributed by the Department of Agriculture for some years, more as matter of curiosity than with the effort to make a tea garden, or to establish its growth as a business, although some few persons had obtained seed from China and elsewhere, and had made efforts to raise and manufacture tea, although with but little result in any case. Probably the largest number of plants collected by any one person, are those collected by Dr. Jones, of Liberty county, Georgia, near Savannah, who some time before the Rebellion undertook to raise a number of plants with a view of making tea. His plantation was practically abandoned, and after the war, his daughter, Mrs. Scraven, prepared tea in a rude manner from leaves picked from the old trees of which there were three or four hundred growing wild in the edge of a forest, the seeds falling from which scattered through the brush, had grown into quite an extended thicket, from which Mrs. Scraven was in the habit of selling plants and seed to those persons who wished to purchase.

When, as Commissioner of Agriculture, I wished to promote the cultivation and manufacture of tea in this country. I purchased from Mrs Scraven plants and seeds for distribution, and I scattered these throughout the South, and we are now reaping the reward of this effort by learning from the growth and condition of these plants the soils and climates best fitted for the production of this necessary article.

It is unnecessary to go into details at this time, and I will simply say that by great good fortune, a Mr. John Jackson, who had for fifteen years been cultivating tea in Assam, India, traveling in this country, had his attention drawn to my efforts tending to encourage the cultivation of tea, and entered into correspondence with the Department, and visited me at Washington. The result was that Mr. Jackson took a trip through the South, visiting the various localities in which the tea-plant was growing, and was so entirely satisfied with the prospect of successful and profitable cultivation that he purchased the plantation of Mrs. Scraven, and commenced to establish a tea garden, with the assurance that the Department would aid him by all proper means.

Mr. Jackson employed a large force of negro laborers, put up some necessary houses, and has already 165,000 plants growing in fifty acres which he proposes to increase to several hundred acres as rapidly as he can obtain proper seeds or plants. After some earnest solicitation, and with the untiring effort of Hon. D. Wyatt Aiken, member of the House for South Carolina, a small appropriation was obtained from Congress in aid of this industry. I have made an examination, assisted by Mr. Jackson, of a large area of South Carolina, in which are found many locations in which the soil and climate were pronounced by Mr. Jackson as exceedingly favorable for the production of the tea plant. This preliminary examination showed more land suitable for tea culture in the belt of country about forty or fifty miles back from the coast, the best land being mostly situated in that portion which is regarded as unhealthy for white people during the Summer months, but not particularly unhealthy for the negro, who seems to live and thrive unharmed by the malarial atmosphere of the rich lands of that section. Mr. Jackson assures me that there is no better soil for the plant in those parts of India with which he is familiar, and which have proved so great a source of profit to the English and Scotch tea companies.

For a number of years persons throughout the South owning one or more tea plants have made tea as best they knew how, but in a very crude fashion, bruising the leaves and drying them in a Dutch oven, or even in the sun, and storing them away as a family supply of the fragrant herb, which they pronounced better than any they could purchase at the stores. Notably this has been done in the last two years, or since the publication and circulation by the Department of a little treatise upon tea culture and manufacture. But no tea has been made of a commercial character until Mr. Jackson commenced to manufacture tea in the proper form, and send it to the Department as an evidence of what could be done, even with the old and neglected plants he had purchased. These teas are undistinguishable from the finest qualities of Indian teas on the market, and have been pronounced by the best tea experts in this country and in London to be of superior quality and flavor. The prices offered for them are eminently satisfactory to the producer. There would seem to be nothing wanting now to secure a fair start toward the accomplishment of the production of our own tea but the continuation of well-directed efforts.

The cost, according to the testimony of Mr. Jackson, will be from 15 to 20 cents per pound, and the wholesale price offered in New York is 40 to 50 cents, and in London 50 to 70 cents per pound. The teas heretofore manufactured and submitted to New York and London houses to ascertain their value, were of the English breakfast sorts, which are not so much used in this country as in London, where they are largely used for mixing with inferior teas to raise the grade."

TEA PLANT.—Fig. 327.

The leaf of the tea plant is manufactured in different ways to secure the different brands of tea for the markets in which it is put. The difference lies in the manipulation of the leaf. Green teas are made without fermentation, whereas the English teas of the breakfast class are all fermented in different degrees according to the quality desired.

Tea culture in China, as at present practiced, is the result of long experience and the devotion of much capital to the industry, until a system peculiar to the climate, labor and customs of the people has grown into existence, which can hardly be copied in the United States, unless coolies be imported and given the labor. As this is impracticable, the next thing is the employment of negro labor, as the locations found best adapted to the growth of the tea plant are those where malaria renders it unhealthy for white labor.

The cultivation of the plant, which grows to the size of quite a tree, consists rather in keeping the plant pruned to the proportions of a shrub and the production of an abundance of new, healthy leaves, than in growing large plants. The manipulation in curing the leaves furnishes the different varieties of tea.

In Fig. 327 we give an illustration of the appearance of the tea-plant when one year old. Figure 328 shows a leaf of an indigenous plant growing without cultivation and presenting a much coarser appearance than the cultivated leaf.

Figure 329 shows three varieties of tea leaves, the smallest is that of the Chinese plant, and the other two are those of Assam hybrids. In Japan only the first three tender leaves of the plant are taken, as shown at the top of plate Fig. 330, while in India six leaves are taken for curing.

The cultivation of the tea plant and the curing of the leaves for tea, cannot essentially differ in this country from the practice in India, but the preparation of the soil can be done with machinery, and there is no possible doubt but intelligent labor and the invention of machinery will make the production of tea much more profitble than where both are wanting. The industry cannot be forced into existence to advantage, but every family in the States south of Virginia and Kentucky may grow its own tea supply with no difficulty. Plants do not bear sufficient for profitable gathering until five years old, so that the necessary time and outlay are considerable. Peculiar climate and soil will have much to do with flavors, and experiments in curing will be necessary, and all will require time and outlay. The industry is a promising one, and great numbers of tea plants are being distributed over a wide range of territory and conditions of soil and climate, and but a few years' time will be required to determine quite definitely the conditions required for successful cultivation. There is no doubt the area of tea cultivation will be extended and that soil suitable for this industry will be found from the James River around fifty miles on the coast as far as the dry region of Texas skirting the Gulf. In fact there is no want of soil suitable for the cultivation of tea.

The plant seems to thrive best upon soil not naturally moist, but yet where there are frequent rainfalls. In experiments in the manufacture of tea it was found that only the young and tender leaves would answer, and in the process of curing, the product was one pound of tea from five of leaves.

The process of curing is simplified to the following general principles: 1, the leaves are placed in a sieve over boiling water until wilted; 2, they are then placed in a coarse linen cloth and wrung out by twisting the cloth; 3, the curled leaves are then placed in a tinned iron pan over a fire and stirred briskly and rolled between the hands until they become brittle. Figure 331 shows the process of heating and curing. Figure 332 shows the appearance of the tea leaves from their green state to that of being dried for packing. Figure 333 shows implements in use and manner of storing the tea. Figure 334 shows the rude mechanical appliances for cleaning tea, while figure 335 indicates the process of picking out any uncurled leaves.

Arboricultural.

TREES FOR WIND-BREAKS AND HEDGES.

THESE are among our greatest wants, and more particularly on nearly all the wide plains stretching eastward from the Rocky Mountains. For wind breaks, and at the same time for forming a good hedge against horses, cattle and sheep, there is nothing superior to the Norway Spruce. For this purpose it should be planted in a double row ten feet apart each way, the inner trees opposite the central space of the outer ones. This is a very hardy tree which grows rapidly, and, being an evergreen, it is much more desirable than deciduous trees for winter shelter. The hemlock comes next in utility to the Norway Spruce, and is of equal hardiness and rapidity of growth, except in stiff, clay soils. The best deciduous tree for a hedge is the Honey Locust, as it does not sucker like the Yellow Locust. Its thorns are longer and stronger than those of the Yellow Locust, and consequently it makes a much more formidable hedge. If properly cut as it grows, neither sheep nor swine can get through it, nor in fact scarcely a rabbit or vermin of equal size. It does not shelter or harbor vermin, as most other hedges do, especially that of the Osage Orange, which has been so much planted at the West.

For timber, fence posts and railroad ties the Catalpa is said now, by many, to be nearly as durable as the Red Cedar or Yellow Locust. If so, it would be the most desirable tree of all to cultivate for these purposes, as it is hardy and grows very rapidly even in a poor soil. Added to this, it is among the most ornamental of our trees, as it has long, broad leaves, and from the latter part of June into July it is covered with a mass of snowy blossoms. We understand that one nursery establishment alone in Illinois, contracted last Spring to set out among its customers, at least 1,500,000 Catalpa trees. These not only assist to lessen the force of the fierce winds which sweep over the plains so destructively at times, but also soften the climate, help to make it more equable and bring in a greater rainfall, or serve to render that which occurs more beneficial.

Farm Topics.

EXPERIMENTS ON GRAVELED BOG-LAND.

PROFESSOR F. H. STORER.

THE merit of the German method of reclaiming drained bogs by covering the soil with gravel, as contrasted with the older method of mixing gravel with the soil, has been tested in Holland by Carsten, who grew oats upon contiguous plots of moor-land which had been reclaimed according to one or the other method. As will be seen from the following table, inferior crops were obtained in every instance from the plots where the gravel and moor-earth had been admixed than from those where the gravel was simply spread upon the surface of the soil and left there permanently, according to the method explained in detail in the RURAL of February 14th.

Each of the experimental plots measured one fifth of an acre, and they were manured as it is stated in the table.

Manure on one-fifth of an acre.	Bush. of oats harvested from one-fifth acre. Where gravel was spread on surface.	Where gravel was mixed with earth.	Cost of the manure for one-fifth acre.
55 lbs. rectified guano. 55 " steamed bone-meal. 33 " sulphate of potash and of magnesia.	6.13	5 56	$4.00
66 " plain Peru guano. 55 " steamed bone-meal 33 " sulphate of potash and of magnesia.	8.51	6.13	4.25
33 " nitrate of soda. 66 " steamed bone-meal 33 " sulphate of potash and of magnesia.	4.26	1.94	3.80
110 " rectified guano.	9.37	6.81	3.80
Same money value of plain Peru guano.	11 08	7.66	4.00

It was thought that most of the nitrate of soda was washed away by rains and that better results would have been got from this material by using a larger quantity of it and applying it at intervals as a top-dressing.

Simultaneously with the foregoing experiments, a couple of plots were manured with night-soil from city cess-pools, applied in such quantity that the cost of it amounted to $14.87 for each of the one-fifth acre plots, and there were harvested from the one plot 12.14 bushels of oats, and from the other 11.35 bushels. It is remarkable, both as regards the night-soil and the guano, that the largest crops were obtained from the manures most likely to be charged with the ferment which would promote nitrification of the moor-earth. It is noteworthy also that an amount of plain guano costing $20 to the acre, gave almost as large a crop (55½ bushels to the acre) as the night-soil, which was applied at the rate of $74 to the acre and gave 58½ bushels of oats, as the mean of two trials.

It has been suggested that the method of reclaiming bogs by covering them with gravel is too costly to be practised here in America, so long as land continues to be as cheap as it is now; and the remark is doubtless true in general and especially as regards large stretches of swamp land. But there are numberless special instances, particularly in the older States, where, taking all things into consideration, small patches of bog could best be reclaimed in this way—notably in the vicinity of houses and where circumstances are specially favorable for moving the gravel. In any event the process deserves the attention of all thoughtful men, because it enforces some very important lessons in respect to moisture, tillage, manuring and the action of frosts.

GLEANINGS.

Weeds are Everywhere Present.

THEY spring up in a night; they flourish like Jonah's gourd; they come without planting, flourish in spite of neglect and of persistent fighting. The land seems full of their seeds; manures are loaded with their germs, and their number is legion. What is a weed? It is a plant out of place. Beans are a weed in a corn patch; corn is a weed in a potato field; wheat is a weed in any place but a wheat field. But aside from plant out-of-place weeds, we have hundreds and hundreds of weeds that are weeds everywhere, anywhere, always. They are never in place; if so, their place has not as yet been found. Weeds want looking after early and late—all the time. The plow, cultivator, hoe, rake and hand must be kept judiciously employed in their subjugation and destruction. Clean culture is the only culture to be admitted. It is the only culture the good farmer knows or practices. Weeds in the field are not the only ones to be looked after. They are by the wayside, in the yards and pastures, scattering their fecund and fertile seeds. They are in every by-place and nook. One weed will propagate evil over a large space. Crops are never beyond the power of injury by weeds until they are harvested. The appearance of the roadsides is a good indication of the farmer's practices; the appearance of his hoed crops is the same with regard to his thrift in all things. Weeds draw heavily on the soil and particularly on the fertilizers used. They are hardy, persistent, vigorous, and claim the lion's share if permitted to grow.

Good Cattle

are the best investment a farmer can put his money into. I never knew a man satisfied with himself or his trade, who bought poor stock at any price to keep. Good Short-horns, Herefords, Jerseys, Ayrshires or Holsteins are cheap at high figures. They produce the best of beef, work, milk, butter, cheese, leather. It is extremely necessary to profit that the farmer buy healthy, thrifty, high-bred animals, those that produce, or are capable of producing the most and best of these products. The next thing, after good blood, is good feed and then good care. Breed, feed, care, are three-thirds of successful cattle husbandry. Good breeds amount to nothing without proper and abundant feed. They amount to but little with proper and abundant feed if not properly sheltered and cared for. They must have suitable pastures and soils, and the surface of the country must be adapted to their constitutions. The Short-horn and Hereford are out of place on broken pasturage and hilly ranges; the Ayrshire, Devon and Jersey are there at home. The Holstein delights in rich, alluvial meads and succulent bottom grass-lands. Good cattle are a necessary adjunct to good farming everywhere and always accompany it. The introduction of good stock into any farming community always has a good effect by stimulating it to better effort and better feeding. It places a higher standard before the farming public. It excites a favorable emulation that works good to all beneath its influence. Good cattle are the highest type of agriculture.

Disproportionate Premiums

at our county and State fairs would seem to call for attention from the public, and especially from the cattle breeders and owners they militate against. The horse premiums are very disproportionate and much larger, taking the class together, than the cattle premiums. I fully appreciate that noble, but not noblest, animal, the horse. I am alive in every sense to his value and services. The horse interest is vast and varied and of immense importance to the country. I appreciate his every quality from the farm to the turf; his every service, civil or military, of draft, conveyance or speed; and summing all and all up, I cannot but make him second to horned cattle in use and benefit. In draft, farm service, and transportation the patient ox is as useful as the horse. In speed and conveyance the horse is ahead. But here ends the comparison. The horse furnishes no food or but very little, and the leather from his hide is inferior. Beef, butter, milk, cheese, tallow, leather, veal, horns, glue and a hundred other articles of use, comfort and luxury come from the cattle, the whole vastly overshadowing and outweighing the usefulness of the horse, with all his utility, splendor and fascination. Yet the agricultural fairs award ten times the attention and money to the horse; hold out ten times the inducements to horsemen, and direct ten times the effort and ten times as much public attention to the horse as to cattle. It does not seem right, and stockmen, farmers and the press should help to adjust a proper balance between the two, so that each may be equally encouraged as each has intrinsic merits and affords benefits to the country.

Pruning Fruit Trees

is a subject with which almost every one who owns and occupies land is more or less interested. It is a subject upon which a wide variety of opinion exists as to time, character, amount and style. Some kinds of fruit need, or will bear, a great deal more and a great deal severer pruning than others. It is a process that calls for a great deal of correct, wholesome thought, and a large amount of the best common sense in judgment. I am aware that experts and experienced nurserymen will form, mold, train, guide and direct trees into almost any form and shape. This may be called the artistic, the scientific side of pruning and training, but the great mass of our orchardists and farmers never can or will attain to that degree of proficiency, and, in fact, it is not necessary that they should. What we want for the masses is to know how little pruning, and when applied, a tree will do ordinarily well with under average circumstances. I have an impression from experience and observation that too much pruning is done than rather too little. The result is the trees have long, unprotected trunks and limbs with fine branches, buds and bearing wood at the far extremities. I believe that every fruit tree should be trained so low as to afford self-shade for trunk and large limbs, and a partial mulch by its dense shade. The fruit is more easily gathered, that which falls less bruised, and winds and storms have less rake upon them.

J. W. LANG.

Dairy Husbandry.

THE DAIRY COW—NO. 11.

HENRY STEWART.

Different Methods of Setting Milk for Cream.

THE dairyman is a fortunate individual. While he sleeps or dreams sweetly or uneasily of the high or low prices of cheese or butter or milk, scores of inventors are tossing in sleepless unrest, all intent upon discovering some new dairy appliances. Thanks to these inventive minds, we have the most effective and convenient devices for setting milk for cream. To mention all of these would be impossible in these limits, but a typical method of each of the two systems of setting milk, viz.: that with deep pails and that with shallow pans, may be described.

Formerly milk was put in shallow pans and only seldom in deep, earthen jars, and we owe the deep pail system to the Swedish dairymen. With the deep pails, deep, cold spring water tanks or ice closets are required, and where flowing cold spring water can be secured, there this more modern system is very convenient, chiefly because of the economy of room. A 20-quart, deep pail is nine inches in diameter; a 10-quart pan is 15 inches, and a pool to hold 400 quarts of milk in deep pails may be no larger than four feet long by three feet wide, while to hold 400 quarts in shallow pans would require a trough 60 feet long and 16 inches wide. The advantage is obvious, and for those who use spring-houses it is a great economy. With a deep pail the milk of a family cow may be lowered into a well and kept at a regular temperature the whole year, and the milk-house becomes a very simple affair. The simple deep pool in which the pails are immersed to within two inches of the upper edge, may be built up of bricks laid in cement, or with walls of cement. This may be constructed above a spring so that the water flows in at the bottom and over the top, and escapes by a pipe built into the side; or the pool is supplied by water brought in a pipe from a spring or from a well near-by. With a spring there may be a constant flow of water and no ice be required. With well water a supply of ice will be required in the Summer, and the house will need to be warmed in the Winter.

But great improvements have been recently made in both the deep and shallow setting of milk. One inventor entirely submerged the milk pails under water by means of a peculiar arrangement of the covers of the pails. This method, known as the Cooley system, effectually seals the pails and perfectly secures the milk from any contamination whatever from the air. By regulating the temperature of the water with ice, the milk may be kept anywhere—in the stable, the kitchen or the setting-room; and as the water tank is made non-conducting, the outside temperature has no effect upon that within. This is a very popular method and is in use in many of the best dairies and creameries. But the use of this method is necessarily confined to those who have a supply of cold water or ice, or who have facilities for disposing of the waste water. Many people are prejudiced against deep setting, and in favor of shallow pans, from which the cream can be skimmed in the usual manner. In fact, mankind differ so much in opinions and prejudices that it is impossible to find any one method against which some objection may not be raised, whether it be justly or unjustly. So in setting milk, some will use shallow pans. The arguments in favor of this method are chiefly cheapness and convenience. Where one has a very good milk-house or cellar perhaps nothing else can be preferable to the common pressed tin pans which have rounded corners and are more easily cleaned than any other milk pan in use. But there are very few such milk-houses and cellars, and to adapt the shallow-setting system to every sort of condition, the invention of the Ferguson Bureau Creamery has been made. This may be kept in a room, or kitchen, or a cellar, as the temperature is regulated by ice kept in a chamber above the milk. The milk pans are inclosed by glazed doors so that dust and other impurities are excluded. These two contrivances are typical of the two different methods, and although there are several modifications of these apparatus I don't know that any one improves upon the original device in any particular.

It has been said that the quantity and quality of the butter produced differ to some extent with the deep or shallow setting of the milk. Some persons have disputed vigorously over these claims, and some have made careful tests. But there has been nothing proved in support of any such claim for either system. After a whole year's continuous trial of both of the apparatus above described, I am unable to perceive any difference in the production of cream or butter either in quantity or quality, and the whole question becomes one of convenience in use. It is very true that one who is expert, from long use and experience of dairy methods may do as well with one system as with another, just as a good workman never finds fault with his tools; but there are those who need the very best arrangements because they do not perfectly understand the principles of their work. Such persons should use the very best appliance they can procure, and whichever they may choose, should stick to it without changing and with perseverance; for one who becomes familiar with a certain way of working will always do better, even if it is nothing more than whittling a stick with the left hand. My weekly production of butter never changes, and the quality never varies, when made in the submerged deep pails or the shallow pans in the Bureau Creamery; the only difference is that the cream is more solid and is of a deeper yellow in the shallow pans than in the covered pails.

Sheep Husbandry.

SHEEP AND THEIR PROFITABLE PRODUCTION.

THE judicious breeding and rearing of sheep is undoubtedly the most profitable branch of husbandry pursued in America. If any one is in doubt as to this, let him consider:—first, the value of the fleece; second, the mutton; third, the pelts; fourth, the increase of the flock; fifth, the improvement of the soil on which they feed, and, lastly, that they can be kept on lands so rough that the herbage must necessarily go to waste, unless cropped by sheep.

What breed of sheep would be best to rear and keep to insure the greatest profit? This can only be answered by each flock-master for himself, as it depends on a combination of climate, soil and situation. On cheap lands, distant from a mutton market, fine-wooled breeds, such as the Merino, Silesian and others of cognate blood, are generally found to be the most profitable, as the wool, the pelts, and the increase of the flock alone, are of any considerable value. Long-wooled breeds to a certain extent may also be kept here, and pay well when their fleeces fetch a fair price for combing for worsted stuff goods. On higher-priced lands, convenient to a good meat market, or to a port of exportation to ship them abroad, choice mutton breeds which bear a reasonably good fleece, are to be preferred. Here mutton, as in Great Britain, is the chief thing to be depended upon for profit, wool being only a secondary consideration.

Of the various mutton breeds, which are considered best? In answer to this we may say that each one may be the best for a certain time, and according to circumstances. If a

combination of a considerably increased size and more flesh is immediately desired in the produce from lean native or Merino ewes or their grades, then a fine, compact, long-wooled ram would be best to cross upon them; but only one, or, at most, two crosses should be made, for beyond this the carcass would run too much to tallow, and the mutton prove too fat for table consumption, except, perhaps, the quarters. After these crosses, the grade sheep should be bred together, or a South, or some other Down ram be put to the ewe, the produce of which would be still more improved in the mutton quality.

For the production of very choice, well marbled, lean, tender, juicy meat, the pure South-Down is the best of all breeds of sheep. Added to this, he is very hardy and thrifty, matures early and fattens quickly. A flock of ewes properly taken care of, annually yield a considerable percentage of lambs over their number, and, being excellent nurses, almost invariably bring them all up well. This is the original Down of England, from crosses of which all other Down varieties have sprung, or at least have been greatly improved. Such are the Hampshire, the Shropshire, and the Oxfordshire. These three last have now become essentially the same as the first mentioned, the only difference being a somewhat increased size, particularly in the Oxford. For this reason we have no doubt this will prove the best and most profitable sort to breed for exportation. The general British market prefers the largest size that can be obtained, which combines with size a lean, tender, savory quality of mutton.

The losses of sheep from disease and other causes, have been very large for two years past in Great Britain; in consequence of this, there is an active demand for them now from America, with the prospect of a continual increase. Thousands, if properly bred, may be disposed of there for years to come at good prices, where only hundreds have heretofore been taken. Here is a most promising opening for our flock-masters, and if they bestir themselves to fill it judiciously, they will be sure to reap a rich reward.

The Poultry Yard.

RAISING CHICKENS FOR MARKET.

L. S. HARDIN.

There is a strange fascination in the idea of hatching chickens artificially. To every one who has had the life nearly bothered out of him by the erratic ways of the old hen, the offer of a method for doing without her services, is a welcome one. While I can hardly say it has been the dream of my life to own an incubator, yet it is with a deal of satisfaction that I have at last got one really at work in my little cellar, and day by day I see the chicks forming in the eggs, and not only does all go on after the most approved natural methods of the hen, but the systematic workings of the automatic regulators of heat and cold seem almost life-like in their strict attention to duty just at the appropriate time.

I have promised a faithful record of my experience—to "nothing extenuate nor set down aught in malice"—my purpose is to raise "Spring chickens" or "broilers" for the New York market the year round. The newspaper quotations and price currents place the wholesale prices from $2 a pair in March, to 75 cents a pair in June—the chicks to weigh from one and a half to two pounds each. This weight the authorities tell us with a unanimous mouth should be reached when the chicks are eight or ten weeks of age, and should cost from six to fifteen cents a pound. All of this may be true, but unless I am greatly mistaken I shall modify my opinion of these figures to a large extent before I reach the end of this series of articles. I verified the selling prices above by interviewing the market-men who sell early Spring chickens.

The best I have so far been able to do with house-raised chickens this Fall is to bring them to one pound two ounces in weight when eight weeks old. I hope to do better than this with improved methods of feeding and still greater confinement of the chicks. So far I have been able to utilize the "scraps" of the house to such an extent that the outlay will not show what a large flock of chicks will cost when fed with purchased food alone. I have many misgivings about their costing only fifteen cents a pound, and much more about their costing only six cents. But whatever it is I shall faithfully record it. It is not my purpose to prove that chickens can be successfully hatched and raised from incubators. That has been done over and over again, and what has been done, can be done, and my failure would only prove my own incapacity for the work, not its impracticability.

The machine I procured had been in service before, some 4,000 chickens having been hatched from it, and it is one of the modern improved sorts. The gentleman who owned it had loaned it, and from neglect the heating apparatus, which never had been very well made, totally failed to work, so I supplied its place with a modern, improved oil stove that keeps a 500-egg oven at a mean temperature of 103 degrees, with a consumption of only three gallons of kerosene a week. At twelve cents a gallon this is but 36 cents a week, though the stove runs night and day. The stove that came with the incubator burnt this much oil in three days. Eggs are 30 cents a dozen, and as I live in a small village near the city where everybody keeps a few hens, I find no trouble in getting all the fresh eggs required. So far not one egg has proven infertile, which has surprised me very much from the fears I was led to entertain by the warnings I had received on this point. In selecting eggs I make it a point to reject all that are very large; to avoid double yelks that will not hatch, and very small eggs that produce small chickens; for I have always noticed that the pigs and chickens that are the largest at birth, as a rule keep ahead of their smaller brothers and sisters.

It is my design to make as good a start as possible. It will be found that among those who grow the eggs you buy, some keep much larger fowls than others, with more vigorous cocks and cleaner nests. Everything about such flocks is usually of better character than in the case of others, and it pays in this particular to get the best. Where a dash of Asiatic blood is to be found in the flock, it insures quick-growing broilers. This, it is true, can hardly be said of the pure-bred Asiatics, as they are too leggy when young, but this characteristic is much changed by the liberal intermixture of other blood. While, as a rule, you are obliged to take what you can get when picking up eggs about the country, yet it is always well to keep an eye on these points and do the best you can. I have never been a believer in raising your own hens and eggs. My purpose is simply to determine if broilers can be raised and disposed of with the assistance of an incubator, at a profit. To do this, I shall not always adopt the best method perhaps, but so far as I can find out, I shall always adhere to the most economical mode of conducting the business.

Long ago I determined there was no money in eggs. For quality one egg is just about as good as an other, while the greatest economy of feeding is in allowing the hens to act as scavengers of the farm, which is the general method and one against which no plan of purchased food can compete. Then, eggs can be shipped such long distances, that while the farmers of Iowa or Tennessee are enjoying fine, open weather that makes the hens lay freely, we may be having a bitter cold that freezes all thoughts of eggs entirely out of the hens' heads. With broilers circumstances change. A city the size of New York consumes an immense quantity, while it is impracticable to get them economically to market from a great distance. The hotels, restaurants, and private families, aggregating a total of over two millions of people, are dependent upon the local producers. Ice cars are of little use in this connection, as a frozen chicken is not the delicacy that a purely fresh broiler should be. Here it seems to me is a grand market that needs developing, and I can see nothing but the incubator to do the work with. Wherein lie its weak as well as its strong points I shall try to find out, and all who wish to try this market may know its hard places by the time I have finished with it.

Like every other undertaking, to make the most complete success of it, the man should be admirably adapted to the work. This I may not be, but by an honest effort I can point out to the one that is capable, should I fail, those features of the market or management of the chicks that need changing and overcoming. Many incubators are now in use raising fancy strains of chickens, while the open market is supplied by the old method, nor do I believe it can be successfully competed with so long as supplies from the Far West where food is cheap, come in direct competition with fowls raised upon purchased food near the city. We must take up that branch of the business, that the others cannot reach. To do this, special attention must be paid to the quality of the flesh, and all modern improved methods of feeding be adopted. To accomplish this, recourse must be had to the best instructions to be found in chicken literature, and we will thoroughly test the French system of feeding to produce the finest quality of flesh with the least outlay for food. It is an experiment with me, but as I shall take every precaution to insure success, and note carefully the course of the trial, my good or ill fortune, honestly stated, will be instructive to those who may read what I shall have to say, and the whole of my experience shall be given in the RURAL.

KINDS OF TEA LEAF—FIG. 328.

Industrial Societies.

ILLINOIS STATE FAIR.

(Rural Special Report.)

THE Illinois State Fair was held at Springfield from Sept. 27 to Oct. 2. The receipts reached some $18,000; but for the fact that the expenses of running the Fair were considerably less than last year, the sum received would have fallen short of paying premiums and current expenses. As it is, it will just about meet them. It must be conceded, therefore, that the Fair was not very largely attended. On Thursday the crowd was large—probably 25,000 persons were on the grounds. Wednesday the attendance was only fair, and on the other days quite slim.

One feature of this fair—and it is a feature occurring every two years—needs attention, with a view to correcting a manifest abuse. I refer to the annual election of officers, which, by the law of organization, must take place on Wednesday of fair week, and upon the fair grounds. It has come to be the practice to devote the entire day to this work. That is, it has come to pass that it takes almost the entire time of the acting vice-presidents, their assistants and others, to secure a re-election, or to substitute some favorite. The afternoon is entirely consumed in the election itself. At this fair nearly the entire exhibition programme was suspended, much to the disgust of visitors, who were loud in their protests against the practice. There is demand for reform here, that should in some manner be speedily met.

The horticultural display was fairly good, though inferior to that made at most Western State Fairs this Fall.

The hall devoted to textile fabrics contained fewer specimens than last year, but in merit they were superior.

In fine arts nothing very remarkable was shown. The exhibit was of about the usual character, not positively bad, yet not worthy of great praise.

The swine exhibit was very choice. Indeed, I doubt if so uniformly good a lot of hogs were ever seen at an Illinois fair, and this is saying a great deal. We have had many larger shows. The Poland Chinas and Berkshires predominated.

The sheep exhibited were pretty strong in the long and middle-wools, though there were fine specimens of imported Spanish Merinos.

The poultry display, as a whole, was larger than ever before, and the birds, with few exceptions, of rare excellence. The Brahma and Cochin class made a very attractive feature, there being eighy-five entries. The Plymouth Rocks were fully represented with choice birds. These fowls seemed to be the general favorites. The old Black Spanish were not as numerous as at former exhibitions. The once popular Houdans were represented by only a single coop, and the owner said he would sell them as soon as he had a chance. The Hamburgs and Polish fowls seem to have many friends, there being 31 entries of them. There was a much less number of Game stock than usual. The Bantam class was full, there being 41 entries of the different varieties, of very choice specimens.

The show of waterfowls, geese and ducks was excellent, as was that of turkeys. There were two large displays of pigeons, which added much to the interest of the show. Rabbits and ferrets helped to make up the display. The poultry interest is growing in importance and shows a decided improvement from year to year.

The fast horse business was the worst failure of any feature of the fair. Contrary to its course for many years, the State Board at its meeting last Winter, decided to introduce "speed rings" into each day's programme. They carried out the programme but it did not draw a crowd; there were no very noted horses present and the whole thing was a fizzle. It is quite probable that there will be a change at the next Board meeting. The "agricultural horse trot" is a thing of the past as an attraction in an Illinois fair ground.

The show in agricultural implements was exceptionally fine. In other departments there seemed to be a falling-off from last year. The fact is, that in but few places can a first-class fair be maintained for two successive years, and there, as a general thing, only by the offer of large premiums and by the most strenuous efforts to please, not only on the part of the fair managers, but also on that of the resident citizens.

MESSRS DEERE & Co., Moline, Ill., made their usual handsome display of their celebrated plows and cultivators in their permanent building on the grounds. They had a very fine specimen of a stuffed deer from Minnesota, emblematic of the name of the firm, mounted on the top of the building, with gilt ones as weather vanes on each corner. As usual, the goods they had on exhibition were gotten up in the very best style—sulky and hand plows and cultivators finished up as fine as workmanship and art could make them. Although they were crowded with orders dur-

ing the past season, yet these enterprising manufacturers filled every one they received. Their Gilpin Sulky plow, which we lately noticed as the only one used on the Dalrymple farm, attracted a great deal of attention. These plows have been in the market for the past five years, and 40,000 of them are now in use. They are celebrated for their lightness of draft and general durability. The fact that of the large number sold there has not been a single complaint shows that they are all that the manufacturers claim for them.

MESSRS. CHANDLER & TAYLOR, of Indianapolis, Ind., made a very handsome display of their Eureka Drain Tile Mills, Mulay Saw Mills and Phœnix portable engines in full operation. Their saw mill attracted a great deal of attention. They showed practically that it could be run with their ten-horse power engine with ease, leaving power to spare. Their new Eureka Tile Mill has proved itself to be all the manufacturers claim for it, and its work on the grounds making tiles from 2½ to nine inches in diameter, and also a fine quality of brick, proved to the satisfaction of the spectators that it could do the work. W. W. C.

VERMONT STATE FAIR.

(Rural Special Report.)

THE annual show of the Vermont State Agricultural Society, at Montpelier, during the third week in September, was much interfered with by bad weather, and was consequently not pecuniarily very successful. On the last two days, however, the attendance was large, and the exhibits themselves were nearly all of a high class in each department. Every popular breed of cattle, Jerseys, Ayrshires, Devons, Short-horns, Guernseys and Dutch, were represented in the stalls by excellent herds, some of which are of long standing, and nearly all in the hands of practical men, who know how to maintain them at a high standard of excellence and make them profitable. The greatest falling off was in the Short-horns, and this, notwithstanding the existence of some of the finest herds in America within the State. The popularity of the Jerseys with the farmers, and the little general interest in breeds deemed too large for profit in a hill country like Vermont, seem to have the effect of discouraging breeders of this class of stock from exhibiting them.

In sheep, there was a superb show of Merinos and Cotswolds, and an excellent one of Southdowns, the adjoining province of Quebec competing with some fine flocks of the two last. Something over 300 sheep in all were shown. There was but a small show of swine, and only a moderate one of work oxen and fat cattle. In poultry, the display was very large and generally excellent, nearly every variety of domestic fowls being represented in something near 150 coops.

The exhibition of vegetables, seeds, flowers and fruits, though moderate in extent, was superior in quality. The fruits, particularly, were very good, and compared with previous shows demonstrated a decided progress, which bids fair to continue and increase.

Orleans Co., Vt. T. H. H., M. D.

MONTREAL HORTICULTURAL SOCIETY.

[Rural Special Report.]

THE annual exhibition of this energetic association took place at the Victoria Rink, Montreal, Sept. 14, 15, 16 and 17, and was decidedly the fullest and best made during the past four years. Last year (which was a good show) the entries were 1,000, this year 1,300. Some of the fruit was not unpacked, and many plates were deposited upon the floor for the lack of table room, although the hall is a very large one. The display of roots and other field and garden vegetables was extensive and remarkably good, while the floral exhibit was simply immense. Montreal has a large number of good gardeners, both amateur and professional, and the rivalry in both classes was very close.

The building was finely decorated and the band of the garrison artillery furnished superb music. The attendance was all that could be desired in point of numbers, and the result, both financial and otherwise, cannot be other than highly gratifying to the Society, which is not only doing much to promote a taste for ornamental gardening and the culture of useful plants, but, by the information it is disseminating both by its exhibitions and its excellent reports, is vastly increasing the skill and success of the orchardists and other fruit-growers of Canada. Already the stimulus given to the culture of the apple has been shown by a large area of new plantations, which are, in consequence of the information derived through this society, of sorts thoroughly adapted to the climate and soil of the country, and are under a system of management which promises, and indeed has already achieved, a success which a few years ago would have been deemed impossible. H.

Miscellaneous.

The Niagara Grape.

MR. J. S. WOODWARD, Lockport, N. Y., kindly sends us a basket of this grape, which is now, we believe, for the first time offered for sale. These grapes had been handled at the N. Y. State Fair, where they were exhibited. Nevertheless they were received at this office in perfect order, not a berry having dropped from the bunch. The skin of this grape is firm, though thin. Between the pulp and the skin the flavor is agreeably sweet. The pulp itself, if broken, is rather acid. But this is not perceived as grapes are ordinarily swallowed. The berry is large, of a pea-green color, ripening with the Hartford. The bunches are long, compact and showy. The quality seems to us better than that of the Concord, while its splendid shipping qualities and, as we learn, the vigor and fruitfulness of the vines must secure it a ready sale.

The Best Wheats for Ohio.

Our heaviest-yielding wheat in the past three seasons has been Silver Chaff. Golden Straw ranked next this year with us, and went ahead on the black sands of Erie Co., near the lake, where it made a fine crop, weighing 63 pounds per bushel. Velvet Chaff has out-yielded Clawson for two successive seasons here, and also brings a higher price in market. Clawson seldom weighs more than 60 pounds per bushel. It is a bad wheat year if Velvet Chaff weighs *only* 60 pounds. Saudomirka continues to promise well, except for its lateness in ripening, being several days later than Clawson. Zimmermann sent to us from the Missouri Agrl. College, promises well. I send you a package containing Golden Straw, Sandomirka, Velvet Chaff and Zimmermann, as being the most promising of our varieties, next to Silver Chaff. The last two are old varieties, but are not widely known and may be new to you. C. E. THORNE.

State University, Farm Dep't., Columbus, O.

INDIGENOUS INDIAN TEA LEAF.—FIG. 329.

Wasteful Feeding.

Here where land is cheap and whence corn, oats, or wheat have to be hauled quite a distance to market, stock is the principal dependence for making money and for getting the best price for our products. For instance, corn is worth, say 20c. a bushel in the market; but by feeding it to hogs one can get 40c. for it when sold in the shape of a fat hog. The usual way is to buy up good stock hogs, and then feed and fatten them for market. It is calculated that for every five pounds of corn one pound of pork can be made, and with corn at 30c. a bushel, and hogs at $4 per hundred, it pays well to feed the corn to hogs in place of selling it.

Different farmers, however, have different ways of feeding. One of these which I think very extravagant is what is called "turning in;" that is, turning the stock right in to the field of corn and letting them eat it up. The land here is mostly in what we call patches, so that if a man has 40 or 50 acres of corn, it may be in eight or ten different pieces, and he turns his hogs into one at a time until they are fat enough for market. Of course, it saves some trouble in gathering and feeding, but I think the saving is more than lost in what is sure to be wasted and trodden down in the field. It is only practiced to a small extent and as pork is high and corn rather scarce this year the practice will be followed less than ever this Fall. N. J. SHEPHERD.

Miller Co., Mo.

The Book Premium.—An Explanation.

MR. G. W. STRONG, who took the 2d prize in the Rural competition, inquires through the RURAL if he did not also win the Book Premium, offered by the Farmer's Pub. Co. through me, as their representative. The information asked for was duly furnished to Mr. Strong at the proper time. But as the RURAL now calls on me to explain, I will most cheerfully respond. The decision of our Co., as already clearly stated and published, was as follows.

"Although the prize-takers in the Rural Corn Trial of last season did not make separate entries or separate reports under the offers we made for the best weight of grain per bushel, yet we are so well pleased with the results they obtained in competing under a different offer, and regard their success as so deserving and creditable that we cheerfully accord to each of the first six winners a discretionary award, as a recognition of the merit and the intrinsic value of their achievement.

We have therefore entered their names on the subscription list of The Business Farmer and Station Record, to receive the same prepaid by mail, every month and every year, as

LIFE SUBSCRIBERS,

without any charge or cost. We have also mailed to each a copy of Chemical Farming, bound in cloth, and we propose further to add (to the three highest winners), a duplicate bound volume of our journal at the end of the first year."

Soon after this Mr. Strong wrote to me saying, "I have received the first three copies of the Business Farmer; also the book and have read them with great interest. I think that every farmer in the land should have them, and I thank you for your generosity, etc."

Thus it appears that Mr. Strong clearly accepted the decision of the Company by making a courteous acknowledgment without any hint of dissatisfaction. CONRAD WILSON.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION,

BULLETIN NO. 47, SEPT. 21, 1880.

Fertilizer Analyses.

459. Bridgeport Ground Bone (dissolved).

460. Manhattan Blood Guano.

Both the above were made by the Manhattan Fertilizer Co., New York and Bridgeport, and sent to the Station by F. C. Stickney, Bridgeport.

476. Matfield Special, for corn, sampled and sent by C. E. Lord, Chester.

468. Tankings, sold by S. E. Merwin & Son, New Haven, and sent to the Station by J. D. Sage & Sons, Long Hill, Ct.

482. Nitrate of Soda, sold by Sisson & Butler, Hartford,, sampled and sent by T. N. Bishop, Plainville.

S. W. JOHNSON, Director.

BRIEFLETS.

THE London Garden reproduces the engraving of the Kittatinny Blackberry from Mr. Roe's article in Scribner. . . . . The reason men succeed who "mind their own business" is because there is so little competition in that line. There is a fortune in it for every man who diligently seeks it, except the minister. He has to mind everybody's business but his own, and hence ministers almost invariably die poor. . . . . A writer in the London Gazette says: "Some employers of servants still lend their countenance and sanction to a most reprehensible practice of great antiquity in the North—that of allowing sweethearts to "sit up" during the night time, extending into the mornings, in the kitchens of the farm-houses." We believe some employers of farm "help" in this country as well still lend countenance to this practice. . . . . Good early apples for Maryland, says J. J. Thomas, are Primate, Carolina, Red June, Red Astrachan, Early Harvest, etc. Gravenstein, Maiden's Blush and Porter are good Autumn sorts; and Smokehouse, Smith's Cider, Yellow Bellflower, London Pippin, Northern Spy and Nickajack are good Winter varieties. Several might be added to the list, and other cultivators would throw out some of these. . . . . The Mark Lane Express is not quite sure that there is much love lost between the people and the House of Lords. . . . . Langsdon Plum—to which we have alluded lately—is nearer to curculio-proof than any other we know of. The plums are as hard as bullets until well ripened. They are about one inch in diameter; the flesh is sweet and agreeable, though the skin is tough and bitter. The tree is very ornamental in foliage and form, and the plums are as red as a cherry in the intermediate stage of ripening. . . . . The White Day Lily (Funkia) is often seen in old-fashioned gardens; but it is pretty enough both as to foliage and flower to be seen in every garden. . . . . A very pretty shrub, and one very little known in America, is Desmodium penduliflorum. A plant of this was sent to the Rural Grounds two years ago by Mr. John Saul. It has wintered well and we shall ere long present our readers with its picture taken while in full bloom. . . . . There is no better time than the present in the entire year to transplant grape-vines. As we have often done before, we urge it upon those of our readers who have not all they need to furnish grapes for the family, to purchase one or more vines. Those who cannot afford to do so, may obtain cuttings from friends. Let them be about eight inches long, including two joints—one near either end. Plant these in mellow soil so that the upper joint shall be at the surface of the ground. Cover with litter of some kind when sharp frosts may be expected and so leave them until Spring. . . . . It is stated that Fultz does best on low land and Clawson on high land. We have raised Clawson on high lands for many years, and Fultz on high land last season, and now we have it on low. We may therefore judge as to the above statement next Summer. . . . . The lessons taught by our corn experiments are:

1, thorough preparation of the land by harrowing and rolling; 2, *drill* seeding from one to two feet apart; 3, *flat* cultivation. . . . . To these we ascribe our great yield of Blount and Chester. Try it, readers, another year. . . . . Mr. Read derives some comfort from the assumption that America does not seem fitted for the production of barley, mutton or wool. . . . . Barbed-wire fences. They have been tried in various parts of the country. We hear few words in their praise—many against them. . . . . Many journals are wroth that certain "Newspaper Directories" estimate their circulations far too low. We hear no fault-finding on the part of those whose circulations are placed far too high. And these latter are as six to one of the former. . . . . No doubt the late sowing of wheat is the only feasible way of protecting it against the Hessian Fly. The yield, of course, will not be so heavy as when sown earlier. Farmers have to choose whether they will sow early and take the risk of the Fly, or late, with the probability of a smaller crop. . . . . Mr. G. W. Hoffman has several times stated that any land that will not produce a full crop of wheat with five pecks seeding to the acre, should not be used for wheat, for it is not good enough. Thick seeding will not compensate for poverty of soil. . . . . A wheat is now advertised in the London papers as "Oakshot's Champion White Wheat." Some of the heads bear 80 to 90 grains Judging from our trials of Mold's Improved Wheats, we have not much confidence that Oakshot's would prove here better than many of our own varieties. . . . . Mr. Fletcher Carr believes the following recipe to be a sure cure for lice on cattle, horses or hogs: Take equal parts of home-made soft-soap and warm water, mix them together, and rub thoroughly in the hair of the animal. It will not loosen the hair, or cause the skin to crack, or become sore, but on the other hand, it removes all scurf, softens the skin, and improves the thrift of the animal. Pres. McCann bought a lot of steers infested with blue lice and tried a mixture of soft soap and about four times its bulk of water. It took off the hair and cracked the skin; but the lice disappeared. . . . . It is recommended in England to leave potatoes intended for seed exposed to the light until they begin to "green." Treated in this way they will keep better and prove more plump and vigorous. . . . . . Few of our new native seedling grapes are of higher promise than the Prentiss. It ripens with Concord. The bunch is large—the berry medium, yellowish-green skin which is thin but firm. The flesh is tender, sweet and juicy. The vine is a strong grower, productive and hardy. . . . . The Rural Home justly complains that the price of agricultural weeklies is too low. Let us suppose a case: The price of the RURAL NEW-YORKER is $2 per year. The price of agricultural monthlies is from one to two dollars per year. Supposing the average to be $1.50 and that the contents, paper and engravings cost the same, the subscriber should pay for the RURAL not less than $6.50 per year according to the Rule of Three. The engravings from nature in the RURAL NEW-YORKER are one of our heaviest items of expense; while if they were mere reproductions they would cost far less than original printed matter occupying the same space. We are not complaining that the price of monthlies is too much—but that the price of weeklies is too little. We heartily wish success to all, but the disparity of price is not fair.

WHAT OTHERS SAY.

WE find the following in the Mark Lane Express, London:

FARMER BEN'S THEORY.

"I tell ye it's nonsense," said Farmer Ben,
"This farmin' by books and rules,
And sendin' the boys to learn that stuff
At the agricultural schools.
Rotation o' crops and analysis!
Talk that to a young baboon!
But ye needn't be tellin' yer science to me,
For I believe in the moon.

"If ye plant yer corn on the growin' moon,
And put up the lines for crows,
You'll find it will bear, and yer wheat will, too,
If it's decent land where 't grows.
But potatoes now are a different thing,
They want to grow down, that is plain;
And don't you see you must plant for that
When the moon is on the wane.

"So in plantin' and hoein' and hayin' time
It is well to have an eye
On the hang o' the moon—ye know ye can tell
A wet moon from a dry.
And as to hayin', you wise ones now
Are cuttin' yer grass too soon;
If you want it to spend, just wait till its ripe,
And mow on the full o' the moon.

"And when all the harvest work is done,
And the butcherin' times come 'round,
Though yer hogs may be lookin' the very best,
And as fat as hogs are found,
You will find yer pork all shriveled and shrunk
When it comes to the table at noon—
All fried to rags—if it wasn't killed
At the right time of the moon.

"With the farmers' meetin's and granges now
Folks can talk till all is blue;
But don't ye be swallerin' all ye hear,
For there ain't mor'n half on't true.
They are trying to make me change my ways,
But I tell 'em I'm no such coon;
I shall keep right on in the safe old plan
And work my farm by the moon.

HEREFORDS AND SHORT-HORNS.—The Short-horn has no quality superior to that which the Hereford possesses; if it has, let it be fairly shown, says a writer in the London Agricultural Gazette. Take each point in order; both breeds have been well tried, both as grazers and feeders. It is acknowledged that the Hereford is the best grazer, and it is asserted in England and America that four Herefords can be fed on the same meat as three Short-horns. There is evidence to show that the milking quality of the Hereford is as good as of the high-class Short-horn, and her milk is much richer. The London market bears testimony to the superiority of the Hereford meat, by always quoting it in advance of the Short-horn. Their early maturity and weight for age have been tested again and again, and there is little difference in either breed. The merit of the Hereford for crossing purposes has been disputed, but now it is an indisputable fact that they are fast gaining ground in the good opinion of graziers.

HAIR HARVEST.—The following is going the rounds of the French press:—"The hair-harvest in France is now in full activity, and dealers are attending the different fairs, and persuading the fair ones to part with their tresses. In certain districts the girls regularly cultivate their hair for the market, the crop being ready for cutting every three years. The Norman women's hair is the finest; the Bretonnes', on the contrary, is the most coarse; while the longest locks come from Limousin. Hair in the north is bleached by the sea-air, and in the mountainous districts it is dark and curly. The Americans are the chief customers for all kinds of colors; Germany takes tons of fair hair; and much of the same hue is sent to England."

TEA LEAF AND MANNER OF CURING.—FIG. 330.

THIN WHEAT SEEDING.—Mr. W. A. Armstrong, in his advocacy of thin-seeding when the ground is well prepared, made the following remarks at a late meeting of the Elmira Farmers' Club:

"Now, let us see what one bushel of seed may do, considering the matter by the light of facts with which we all have familiar acquaintance. A single kernel of wheat in the fruit becomes 30, or more—most varieties give as much as 36 kernels to each full head. Then if each kernel of the bushel of seed gives thirty-fold in the yield, the bushel must give thirty-fold. But this is the lowest limit of capability for the fruitful seed, for it is based on the lowest product, one ear for each kernel of seed. When the soil is suited to wheat, and is well fitted for the seed, a single kernel, by tillering, may produce thirty heads. In good growth it should never average less than four or five stalks, and as many heads. Take the lower number and the bushel of seed, if each kernel reaches a moderate limit of production, must give a crop of 120 bushels. But this is never raised on an acre of ground, hence the conclusion that some part of the seed is wasted, even when but one bushel is sown. That is to say, sowing one bushel to the acre presupposes waste, and it may therefore be assumed that when two bushels are sown where less than one is required, one bushel is wasted. By this process of reasoning, the conclusion that 20,000,000 bushels are wasted annually in the seeding in this country is inevitable:—if it be assumed that as many acres are sown annually with two bushels to the acre. The acreage of wheat is estimated at about 32,000,000, and the average yield less than 18 bushels to the acre. There is great waste somewhere, if as much as one bushel of seed is used to the acre, for that should increase more than eighteen-fold; but more seed is used—certainly a half bushel more—and the waste is therefore still greater."

Mr. Armstrong during a recent visit to Ohio, ascertained the following from a Mr. Benedict of Braceville.

Mr. Benedict had a field, a portion of which was in potatoes in 1879, and gave a very poor crop. He plowed the field for wheat, and by an error in setting the drill, he got less than a bushel of seed on about an acre of the potato ground, and then set the drill to distribute about two bushels to the acre on the remainder of the field. At the harvest the thinly-seeded acre gave a much heavier crop than any like area of the thickly-seeded portion.

HORSEMEN AFTER FAIR PREMIUMS.—No class of exhibitors, says the N. Y. Tribune, at a fair are so sharp for premiums as horsemen. The fuss and worry of the average horse exhibitor and the physical energy put forth, if spent in a political way, might send him to Congress. When disappointment comes, as come it must to nine out of ten, there ensues a flow of tropical language which might be Congressional, for it is expressive if not elegant. The trotting-horse generally is still in the foreground, and commands the attention of the multitude. The useful Norman or Clydesdale goes too slow.

A PROFITABLE ORCHARD.—J. S. Woodward, Lockport, N. Y., has a 200-acre farm four miles out of town, which was visited by the Editor of the Country Gentleman. He writes that his 30-acre apple orchard is 14 years old, in which 200 sheep and 40 swine destroy all the codling worms that fall, and very few of these insects are found in the fruit. Sheep have proved more efficient than swine in the greater vigilance with which they seize every dropping apple. To prevent the sheep from eating the bark of the trees, he washes the trunks with a mixture of lime wash, common and whale-oil soap and sheep dung. These animals are kept in the orchard till September. They eat the fruit and branches within their reach, and some years have thus devoured 200 or 300 bushels, but the benefit resulting from keeping them so late overbalances any loss. In all cases the sheep must be well fed in troughs with grain, in addition to the grass and fallen fruit. He thinks the hogs cleared out all the canker worms at the commencement of the entrance of these insects into the orchard. The trees are mostly Baldwins, with Rhode Island Greenings, and Roxbury Russets. Last year the crop amounted to 2,600 barrels, which sold for over $5,000.

WINTERING BEES.—Mr. J. King advises in his bee journal that, inasmuch as honey stored in June and July is thicker and contains less acid than that stored later in the season, it be removed from the hives and put away in a dark, dry place for Winter purposes, and its place in the hive be filled with frames full of comb foundation set in the center of the hive; and, if a dearth of honey in the flowers occurs, feed a little sirup from the best brown sugar each evening from the entrance of the hive. This, says Mr. King, will promote rapid breeding, and by the time Fall flowers are ready there will be a host of vigorous young workers to store it away. As bees are not inclined to store honey in boxes in the Fall, Mr. King uses the extractor and replaces the empty combs in the center of the breeding department of the hive, a process which, he believes, invariably excites the bees to intense activity. When the Fall harvest is going on the queen will appropriate space in these center frames of the empty comb in order to insure a sufficient number of the young bees going into winter-quarters. Finally, Mr. King extracts all the combs containing honey and no brood to speak of, and puts them away for use in early Spring; in their places he sets the frames full of summer-stored honey. With six or seven frames in the center of each hive he brings the close-fitting division boards close up and places a chaff cushion on top of the frames, about four inches thick. Air-holes are left open in each end of the cap and the entrance is contracted into about one inch space. Quinby gives the necessary supply of honey at five combs, averaging five pounds each, or six weighing four pounds each, for wintering indoors, with an excess of five pounds for hives wintered outside.

CATALOGUES, ETC., RECEIVED.

DAIRY FARMING, by Prof. J. P. Sheldon, published by Cassell, Petter, Galpin & Co., New York. This is the 15th monthly number of this splendid work to which we have had frequent occasions to refer during its publication. It will probably be completed in 25 numbers at 40 cents each, and will be the most exhaustive work that has ever appeared on the subject of which it treats. It is copiously illustrated both by large finely colored plates, one as a frontspiece to each number, and by numerous wood-cuts of dairy appliances, buildings, plans, etc., etc. We would strongly advise our readers to secure this work, which is full of varied instruction in every branch of dairy husbandry.

FARMING WITH GREEN MANURES, by C. Harlan, M. D., published by J. B. Lippincott & Co., Philadelphia, Pa. This handsomely gotten-up, cloth-bound volume of 269 pages, 12 mo., is a second edition, revised and enlarged, of a work already favorably known to some of our readers. It is not so much a record of personal experience or observation on the subject of which it treats, as it is a compilation of what has been said on it in various books and periodicals. A perusal of it will give a good deal of information with regard to other people's experiences on green manuring.

Everywhere.

RURAL SPECIAL REPORTS.

ARK., Paris, Logan Co., Sept., 20.—Grain crops are an average in this county; but the rust has shortened the cotton crop very materially. But little wheat was sown in this region and the yield has been poor. The Spring drought ruined the oat crop; most persons have not even saved their seed. Of the seeds sent me from the RURAL Office, Mold's Ennobled Oats did well, considering the drought. I am well pleased with them. The Telephone Peas were injured by dry weather and were planted two weeks too late, but I consider them superior to any we have in this country. The Cuthbert Raspberries did well, but we planted most of the other seeds in open ground and they failed to germinate on account of the drought. The Mulberry cuttings got open in the mail and were dried up so much that, although carefully treated as grafts on growing stocks, they failed to grow. I procured some seed of your sort of Doura corn, and it is now ripening the grain. It proves to be an old acquaintance. I first saw it in Twiggs County, Georgia, in the Fall of 1822, where the boys were cultivating it for parching corn, under the name of Egyptian Wheat, and I have cultived it for fowls, and at one time had flour made of it, of which it makes an excellent article. I lost the seed about the end of the war, or soon after, and was glad to get it again. It is a splendid fodder plant and can be profitably sown broadcast when laying by Indian corn, to be fed off by stock, after the corn is gathered. I drill it in rows, like sorghum, and thin out to eight or ten inches apart. When planted for grain, it should be put in at, or about, the time of planting corn. I also have the old white-seeded Dhoura corn which we plant for fowls and fodder, for which it is very good, but it seldom tillers much, unless the soil is very rich. Teosinte will not do here, it fails to make seed or even head. We may keep the roots alive through the Winter by mulching, for the second year. H. M. Y.

ARK., Greenwood, Sebastian Co., Sept. 22.—I would suggest to the correspondent who pleasantly described the RURAL Farm, and so wittily mentioned the mosquitoes, in a recent number of the RURAL, that he emigrate to this country where a person may travel all day without seeing any, and where one very rarely comes in contact with them at night. For some unexplained reason the climate of Western Arkansas does not agree with mosquitoes. But we have other pests here, commonly called chiggers, which are equally as troublesome as the Northern mosquito: and unless one is familiar with the use of soda water and soft-soap, he will be in perpetual torment during the warm season, and especially while blackberries are ripe in the months of May and June. Being about the size of the point of a pin, it is a very difficult matter to see them unless one has a good microscope. My Blount Corn was planted March 30th, and in 90 days it was fully matured. I planted it in drills four feet apart. It yielded at the rate of 80 bushels, shelled, per acre. I gathered it as soon as it was dry on the stalks, reserved the most fully developed top ears for seed, braided them in bunches and hung them in the loft of my cabin. On examination a few days since, I found the weevil had commenced working in the grain, so I took them down, pulled off the husks and laid them away in a tight bin, after giving them a good sprinkling with Turkish insect powder. I planted another piece of common Dent corn for a late crop on June 14th; that also ripened in 90 days, and made a fair crop, taking the mode of culture into consideration. Last season I planted a premium patch of Blount's Corn in Northwestern Penn., about the middle of May, and while it made an immense growth, it failed to get ripe before frost in September following. The soil is so much warmer and more sandy here, and we have so much more sunshiny weather, that crops mature much earlier than in the Northern States. R. R.

MO., Pleasant Mount, Miller Co., Sept. 21.—We had a good rain here the other day. It came in good time as the ground was very dry. Farmers are busy sowing wheat, and the rain will help greatly, as the ground was so dry that some were afraid to sow, thinking the seed would not germinate. It will also help pastures and give us plenty of stock water. Stock of all kinds are still bringing a good price. Good sucking mules are worth from $25 to $35 and two-year-old mules are worth from $80 to $110, according to size, etc. Good stock hogs ready to fatten sell at from 3½ to 4½ cents per pound; the profit on them being in feeding. N. J. S.

NEB., Harvard, Clay Co., Sept. 28.—Although the season has been very dry, the crops have done a great deal better than could be expected. This is a good wheat country, yet the crop is light this year, yielding from 10 to 15 bushels per acre; corn, from 10 to 40 bushels; barley, 10 to 20. Potatoes are not very good throughout this section; the Early Ohio has done the best with us. It beats the Early Rose "all to smash," and is about 10 days earlier. M. A. W.

N. Y., Afton, Chenango Co., Oct. 1.—Crops, except grass, have been pretty good. Corn is a good average; potatoes are rotting very badly, but the yield is good—above the average. They are selling for 20c. to 25c. per bushel. Oats are an average crop in bushels, though the grain is light—price, 40c. to 45c. Wheat is a light yield—price, $1 to 1.25. Hay is scarce—price paid, $12 per ton at barn. Stock is cheap; one can have the pick of a dairy at from $15 to $20. The drought has cut our butter crop short quite a good deal. From last May until this week we have not had rain enough to wet the ground two inches. I think that feed (hay and grain) is higher than it will be next Spring, for farmers are cutting down stock and holding their feed, and using everything that is feed. This season will be a benefit in this way—it will tend to cull out the poor cows. Creameries and cheese factories, too, tend to make better cows. Farmers take their milk there, and they learn to a pound of milk what their herds yield. Then a competition arises among them, each being anxious to get ahead of his neighbor, and, of course, if he is ahead he tries to keep there, and will feed his cows a little better. This keeps the cows in better flesh and in better condition for Winter. These butter and cheese factories not only make a better article than private dairies, but they tend to the culling out of the poorer cows and the better feeding of the better ones left. Some farmers here get from 12 cows as much butter or cheese as others do from 18 or 20. G. E. N.

CURING TEA LEAVES.—FIG. 331.

N. Y., Elmira, Chemung Co., Oct. 4.—Autumn thus far has been most favorable for farmers. Warm weather and abundant rains have given wheat a good start and furnished good, fresh pasturage for stock. Our first killing frost occurred Oct. 1st. Up to that time tender plants remained green and second-growth tobacco continued to grow until it had in many cases assumed considerable size and blossomed. Fruit is very plentiful throughout this county, especially apples, which are a drug in our market (Elmira). Fall apples can be obtained in large or small quantities for 20c. per bushel. The tobacco crop was housed in good season and generally in good condition, not having been damaged in the least from storms of wind or hail. Early crops are already nearly cured and in most cases show indications of desirable colors. Late-set crops, favored by plentiful rains after Aug. 20th, made good growth and if the weather continues favorable through the curing season, will, it is probable, make as good a quality as the early crops. G. A. G. JR.

N. Y., Rural Farm, Oct., 8.—Cutting the second growth of grass and clover—the first having been very light—is now occupying the time of our farmers. This has delayed wheat sowing ten days beyond the usual time. Our wheat is all in save a few experiment plots which will be sown as soon as the rain which is now falling ceases. Our heavy yields of Blount and Chester Corn excite the interest and comment of our farmers. Most of it still remains in stooks awaiting the inspection of several prominent men who have been invited to test the accuracy of our statements. MAJOR.

N. C., Brookston, Warren Co., Sept. 27.—We are now having fine weather for cotton picking, which is much earlier than usual. Though we have an extra growth of weeds, the yield will hardly be above the average, some fields having been injured by rust. The corn crop is giving even better returns than were anticipated, being at least 10 points above the average. Crab Grass is abundant. Stock having access to stubble fields are in fine condition; such as are confined to outside grazing are poor, as usual. Prices:—cotton, 10½c.; sweet potatoes, 40c.; eggs, 12½c.; wheat, $1; labor per day, men, 40c., with rations; women, 25c.; picking cotton, 40c. per 100 pounds. M. B. P.

OHIO, Camden, Preble Co., Sept. 29.—Those that got their ground plowed soon after our rains, got their wheat in, in fine condition. It has come up well and the fields begin to look green. Corn is a good, not a large yield; it is curing out nicely. We are having it cool and dry—splendid weather for housing tobacco, of which there was an unusually large amount raised in this vicinity. W. M.

TEXAS, San Antonio, Bexar Co., Sept. 23.—Much rain, a great drawback in gathering the cotton crop. Corn is a light average crop; it was planted late, the first planting having been killed by the frost; it is worth 65 cents per bushel; cotton, nine cents. Wheat averaged 13 bushels per acre in this neighborhood, though hurt by the rust. The International Railroad is now being built between here and Austin. G. W.

UTAH, Brown's Park, Summit Co., Sept. 25.—I've lately removed to this place from Rock Springs in this Territory. That was a coal-mining district, where nothing grew but sage bushes. This is mainly a stock-raising country, right on the banks of Green River, which runs into the Colorado about 100 miles south of this place. All the cultivated land here has to be irrigated. Wheat, oats and most other field crops grown here seem excellent, as do all sorts of garden stuff. W. S.

VERMONT, East Poultney, Rutland Co., September 28.—I have been a reader of your valuable paper for eighteen months and in that time have received a great benefit from the experience of those who contribute to its pages, to say nothing of what comes from the Experiment Farm. I have for some time felt a growing desire to add an occasional word "of thanks if nothing more." My experience in farming is very limited as are my acres. Dr. Hoskins once remarked, in an agricultural meeting, that he at one time owned 16 acres; my number exceeds that by six, and being very willing to learn from others I hope some day to make my little farm as productive as his. Now, a word about corn. This season, after studying through and through a circular put out by the Hoosier Drill Co., obtained through the RURAL, I became convinced that it was best for me to drill my corn, which I did with a hope to have a planter by-and-by, dropping one kernel in a place ten or twelves inches apart. The result is the best crop I ever raised, the growth being even and good, hardly a stalk being without a good, sound ear and very many with two, and a few with three. After I was through planting I was pleased to notice that at the Experiment Farm the corn was also drilled. I am watching for the result of your trial. J. H. M.

CAUSE OF CHANGE IN DEFIANCE WHEAT.

I am much pleased with the constant improvement which I observe in the RURAL, and am greatly interested in the result of your experiment with shriveled Defiance Wheat. I think you have obtained a new variety by the treatment to which it has been subjected. In my numerous experiments I have met with results somewhat similar. Seedlings of potatoes which yield much seed, usually resemble the parent, while varieties which yield only occasionally a few small, imperfect seeds, sport into numerous forms and colors; the strain seems to break by being subjected to new and unusual conditions. The small and imperfect kernels growing on the tassels of corn, if planted, will sport, producing new varieties. The same law holds good with most of our fruits, as cherries, pears, apples, plums, etc. As a general rule, plants which bear very small seeds sport oftener than those which bear an abundance of large, plump seeds. All my experiments lead me to believe that round, plump seed usually produces plants like the parent strain, while *small, weak, imperfect* seed oftener produces new varieties.

The Cuthbert Raspberry plants which you sent me last March, have made a strong growth. Some of the branches are now loaded to the ground with their weight of fragrant fruit. I have 23 kinds of Ricinus growing this year; the Rural Bronze is the finest of all, and the one I would part with last. The strain seems to be well fixed, as in a long row all are of the same hight, color and general habit.

Sonoma Co., Cal. LUTHER BURBANK.

The Querist.

ANSWERS TO CORRESPONDENTS.

Tests for Oleomargarine.

L. H. S., Franklin, Mass., asks whether there is any simple test for distinguishing oleomargarine from butter.

ANS.—There are two ways in which oleomargarine is used—as an adulterant of genuine butter and in its natural condition. No easy or certain way has yet been discovered of detecting oleomargarine in butter. Of several tests that have been given from time to time experience has shown that none can be relied upon except where the oleomargarine is poorly and carelessly made, or where the would-be butter is entirely oleomargarine, except the small portion of cream churned with it to flavor it. Of these tests Professor Caldwell, of Cornell University, who has experimented a good deal in the matter, says the following gives the best results:—Over a piece of good butter as large as a chestnut, in a wine-glass, pour about twice its bulk of ether; stir it up until the fat is all dissolved. Let it stand a few minutes until the undissolved salt has settled at the bottom. Pour the clear solution off into a tablespoon and set it aside for an hour or two, or until all the ether has evaporated. Treat a piece of oleomargarine in just the same way, and on comparing the fatty

matter of each left behind, that from oleomargarine will be found to have a more or less distinct tallowy odor, which may become more apparent if the spoon is held for a moment in the hot steam from a boiling kettle. The residue from good butter has no such odor; but genuine butter may be adulterated with half its weight of oleomargarine, and the adulteration cannot be detected by this test, though the best we have. The simplest and perhaps the best means of detecting genuine butter from genuine oleomargarine is to heat samples of both several degrees above the boiling point of water, when it will be noticed that the butter foams much more than the oleomargarine. There are several other tests which experts alone can employ successfully, but even with these the detection is often doubtful to the unprejudiced, as is seen frequently in our police courts when efforts are being made to convict dealers who have been selling oleomargarine as butter, without having stamped the containing vessels as the law directs. The matter was up before Congress during the last session, and it is to be hoped that the scientists to whom it was referred will be able to devise or discover some simple and certain test before the meeting of the next Congress.

Cribbing.

R. H. M., Pittsford, Mich., asks for the cause and a remedy for crib-biting.

ANS.—Crib-biting is due to a diseased condition of the stomach, and for it no cure has yet been discovered except on the principle of restraint. Young horses that have been raised on a farm and have had plenty of hay, grass or other bulky food, often become cribbers when stinted in their allowance of such food. The unusually empty stomach is annoying to the animal, producing an uneasy sensation, which leads to biting the manger and finally to cribbing as a means of distending the half-empty stomach. Then again, nervous and excitable horses frequently become cribbers from confinement. Indeed confinement and its frequent attendants, unclean stables, inaction, and foul air are the most common conditions that lead to the fault. The animal seems to be affected as with heartburn or dyspepsia, as may be inferred from the slight belchings that generally accompany the action. To relieve crib-biting the stable should be well ventilated, a lump of rock salt placed in the manger, and should this not effect a cure, add a piece of chalk, and if this too fails, dampen the food, and when feeding it, sprinkle some magnesia upon it and mingle a handful of ground oak bark with each feed of grain. It frequently happens, however, that none of these cures the fault, and then the most common method of restraint is to buckle a leather strap so tightly round the neck, just behind the jaw, that when the horse attempts to crib, the muscles of that part press so hard against it as to cause so much pain that the horse desists from cribbing. A better, perhaps, and certainly a safer remedy is to have no point in the stall on which the horse can rest his teeth for the purpose of cribbing, unless it be placed higher than the usual hight of the manger. A hight of about 56 inches from the floor is sufficient for an ordinary-sized horse, and a manger less than 18 inches high is also considered quite safe.

Japan Clover—Lespedeza striata.

M. B. P., Brookston, N. C., sends, for name, specimens of a plant of which he says: "It appeared among the mountains of North Carolina about the year 1865, and has been known as Japan Clover. Since then it has spread until it is now found east of the center of the State. It grows along roadsides, in old fields and along the edges of woodlands and in open spaces among the trees, affording good pasturage for cattle, sheep and hogs."

ANS.—This is Lespedeza striata. It was first noticed, according to Mr. Killebrew, in 1849 near Charleston, S. C., the seeds having been brought probably from China or Japan in tea boxes. It has thence spread over many States, rooting out in Tennessee broom and other grasses. It flourishes upon the poorest soils, and is not killed by the severest droughts. Thus, as cattle like it and it is perennial in warm climates, it is valuable on soils where little else will grow. Mr. Pendleton says of it: "As it has a small leaf, it interferes with the idea of botanists that large-leaved plants feed mostly on the atmosphere." But the leaves, though small, are very numerous. Again he says: "It has great endurance so far as roots are concerned, but the branches and leaves will parch and die out under a burning sun. The plant, however, soon rallies when rains set in." It is good pasturage for stock. The familiar name is Japan Clover, and Mr. Pendleton gave it the additional name of King Grass, which is not needed. Besides, it is misleading to call clovers, grasses. "King Grass" suggested itself because it soon roots out and destroys "every living plant in its path."

Cost of Making Pork.

R. H. G., Magnolia, Ind., asks what is the cost of making pork with corn at, say, 30 cents a bushel.

ANS.—It is impossible to give a definite answer to this question, as so much depends upon conditions that vary greatly in different cases. Young pigs, say from five to eight months old, gain in weight much more, from the same quantity of food, than older ones. Some breeds too gain more than others, and all the recognized breeds, more than "scrub" animals. Then again, the temperature, and the amount of exercise they take have more or less influence on their gain from the food they eat, to say nothing of the manner in which this is given them, and various other points of treatment. In an article on Swine Husbandry in the first quarterly report of the Kansas State Board of Agr'l. for '80, it appears that with corn at 20 cents a bushel the cost of making pork is given by different farmers, at all the way from one to three and a half cents a pound, with an average of about two and a half cents. A careful farmer who experimented in winter feeding a few years since, says that his hogs averaged eight pounds gain from 80 pounds of corn in the ear; eight and one-half pounds gain from 60 pounds of shelled corn; nine and one-third pounds gain from 60 pounds dry meal, and 10 pounds gain, in another case, from 80 pounds of corn in the ear.

Treatment of Echeverias.

S. McC., Olney, Ill., asks the best way to winter echeverias; what is the best mode of propagating them, and when should the seeds be sown, all in the absence of a greenhouse.

ANS.—In the absence of a greenhouse echeverias may be wintered safely and with very little trouble in any cool room where it is not likely to freeze hard. They must be sparingly watered while dormant. If a very cold night should occur, a few newspapers or a sheet will be sufficient protection. If the room should be warm enough to excite growth, they should be kept near the light. They will keep well in a cool cellar, but must have very little water. The strongest plants are soonest obtained from offsets. A more rapid way is to propagate from leaves. Detach the ripened leaves from the old plant and insert the end slightly in a pan or pot of sand, or even lay them on the top of the sand. Nearly every leaf will make two or three new plants. Seed in your case should not be sown till Spring (say March) in sandy soil in shallow boxes placed near the windows, the young plants separated as soon as they can be handled and got out-of-doors as soon as the weather will admit. The echeveria is not nearly as tender as is generally supposed.

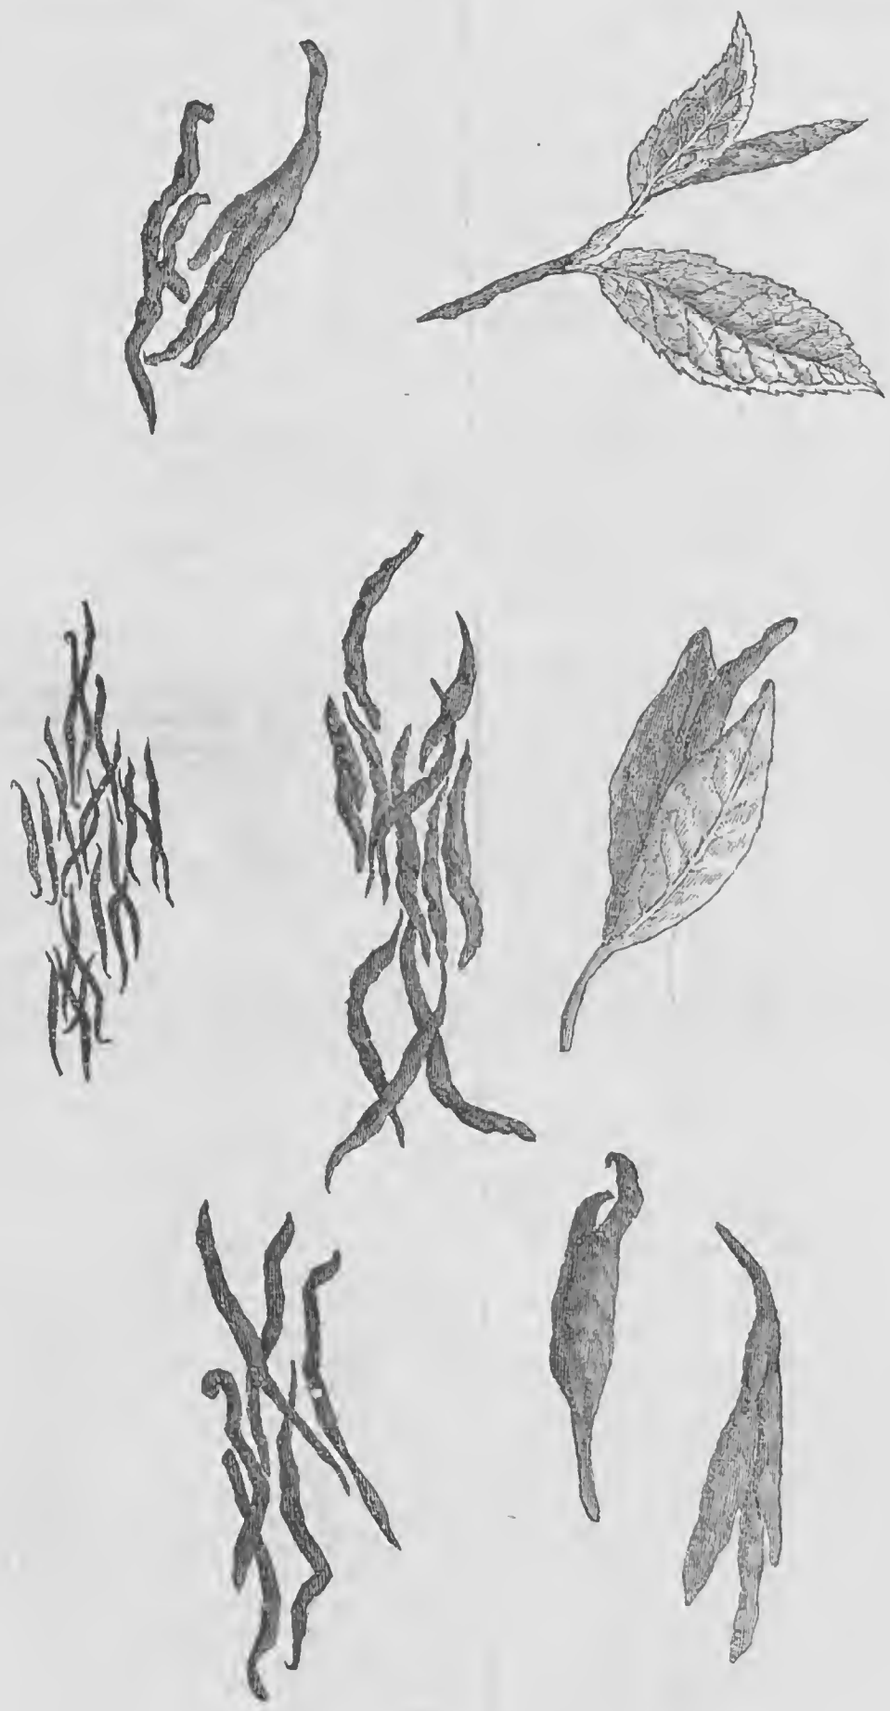
Attention, Pigeon Fanciers!

H. S. B., East Schodack, N. Y., asks some one well "posted," to tell him, 1, how to raise pigeons; 2, how to prevent them from flying to other folks' premises; 3, will they breed in confinement, and, 4, will they thrive with their wings clipped.

[Remark.—Speaking for ourselves, the only trouble that we have had with pigeons is that they increase too fast. We do not think they would do well if confined, though, doubtless, they would breed. The propensity of pigeons to wander over neighboring premises is one that cannot be controlled except by giving them every care which would induce them to remain at home.—Eds.]

Miscellaneous.

J. A. S., Greencastle, Pa., says that he forwarded to us a specimen of wheat properly marked for identification, with his initials and address, and asks its right name; thereabouts it is called Ankney, and is quite a popular sort. 2, A couple of agents are there selling a wheat they call Golden Chaff Eureka; it is a smooth wheat which they claim grows unusually tall, with heads from five to six inches in length, containing from 50 to 60 grains and yielding from 40 to 50 bushels per acre. It is said to have been grown in this State.



TEA LEAF AND ITS PRODUCT.—FIG. 333.

ANS.—1, Among a dozen boxes of wheat, we find none marked as above. 2, We do not know of any variety of wheat called Golden Chaff Eureka. Golden Chaff is an old variety extensively cultivated some 30 years ago, but it has long since fallen into disfavor. It is late in ripening; the straw is tall, the heads long, the grain good and the flour excellent. It is still cultivated here and there, for "auld lang syne's" sake, but there are now a great many better varieties. It is also known by different local names, such as Golden Straw, Whig, Red Chaff, Shot, etc. Eureka wheat resembles Clawson. We put no faith in the representations of the agents alluded to.

J. P. P., Utica, Mich., asks whether the Rural Branching Sorghum and the Poor Land Cow-pea will mature there.

ANS.—An experiment is the best guide to determine that point. Not the least important object of the RURAL Free Seed Distribution is to enable the farmers of the country to test what success can be achieved with the most promising new seeds and plants in their own neighborhoods. Success or failure for one year, however, is no absolute proof of the fitness or unfitness of a plant or seed for any particular locality, as various specially favorable or unfavorable conditions of seed, season or cultivation may in a single case determine this point in a direction contrary to the result of a series of years. See Cow-pea report last week.

R. J. W., Wallsburg, Erie Co., Pa., asks what is the true name of the wheat thereabouts called "Log Cabin;" 2, is Blount's Prolific Corn suitable for that latitude—42 deg north, and if so, where can it be had.

ANS.—1, We do not know. 2, It has thriven as far north in many cases; though several of our reports from that latitude have been unfavorable. It will grow earlier, however and anyhow a small experimental plot would help to decide the question. It can be had from B. K. Bliss & Sons., 34 Barclay St., or J. M. Thorburn & Co., 15 John St., this city.

J. C. H., Richfield, Utah, asks, 1, which is the best knitting machine and what is the price; 2, where can information be obtained about taxes on goods sent from that place to this.

ANS.—1, See advertisement of the Twombly Knitting Machine in this issue, and send P. O. card for price etc. It's as good as any we know of. 2, No taxes are levied on goods sent from one part of the country to another, by the municipal, State or general government, which alone can levy taxes. Freight charges, however, are often called taxes on industry, and what these are can be learned at the next railroad station.

C. M. Y., Marshall, Minn., asks where can Blount's White Prolific Corn be bought; its price per bushel, and whether it would be likely to do well so far north as central Minnesota; 2, where can he get a bushel of Mold's Ennobled Oats. The oats from the RURAL'S Free Seed Distribution gave the heaviest yield he has ever seen.

ANS.—1, Blount's Corn, we fear, would hardly mature so far north. 2, B. K. Bliss & Son., of this city can furnish the oats, and this is at present the only firm we know of that can.

W. S., Brown's Park, Utah, asks whether a windmill and pump would do to pump water for irrigating purposes out of the Green River on whose bank his place is—the land being eight feet higher than the surface of the river.

ANS.—Yes. A good windmill, such as any of those advertised in the RURAL, would probably be the very best means of getting up water for that purpose. Should a large area require irrigation, of course more than one windmill would be needed.

J. W. S., Pitkin, Col., asks the best authority on cranberry culture, and where plants can be purchased in quantity.

ANS.—White's Cranberry Culture, $1.25, Eastwood on the Cranberry, 75c., are as good as any. To be had through the Am. News Co., N. Y. City. The subject is treated in a briefer way in several works on the culture of small fruits. Cuttings can be had through J. T. Lovett, Little Silver, N. J., or of most prominent nurserymen.

O. B. S., Seymour, Wis., asks us to send him the White Elephant Potato; but he is one of several who have applied for our Free Seed Distribution without inclosing the two three-cent stamps—half of the postage which we are obliged to pay. Our last Distribution was sent to hundreds who inclosed no stamps for postage. But we shall not do so again. Those who are unwilling to pay half the postage are not the persons who, as a rule, would give our seeds the careful test they deserve.

J. D. G., Cambridgeborough, Pa., sends for name a leaf of a plant which, he says, grew from one of the seeds sent out by the RURAL in '79.

ANS.—We do not recognize the leaf as belonging to any of the seeds or plants we have sent out. It looks like that of a Canna.

W. W. W. Griffin, Ga., has some land which he intends to reclaim from a salt marsh, and he asks whether it would be an excellent place for growing asparagus.

ANS.—Yes.

D. E. McA., Tryon, N. C., says he has forwarded specimens of fruits from Tryon Mountain.

ANS.—They have not been received.

N. S., Nineveh, N. Y., says he sent some specimen grapes for name.

ANS.—They have not arrived here.

J. H. S., Alpena, Mich., asks what is the proper season for girdling grape vines.

ANS.—As soon as the fruit is set.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, OCT. 16, 1880.

SPECIAL NOTICE.

MANY of our subscribers are sending us the required amount of postage stamps (six cents) requesting us in return to send the White Elephant Potato, as if additional postage were required for the other seeds or a separate application necessary. We beg our readers to understand that six cents are all we ask from them for the *entire* distribution—the rest of the postage the RURAL pays. Applications may be made from now until March. Write the name and address plainly and say "SEND SEEDS." That is all we desire except that our friends will not stick the postage stamps to their letters.

OUR new posters and premium lists are now ready, and will be sent without charge to all who apply.

FIRST, *thorough preparation of the land* by plowing, harrowing and rolling. Second, *drilling in the seed* from one to two feet apart, according to the size of the stalks of the variety planted and its suckering habit. Third, FLAT cultivation. Fourth, *sufficient* cultivation to keep the surface mellow and free of weeds. The above we believe to be the treatment to which we owe our immense yields of Indian corn.

REPUBLICAN and Democratic politicians, from platform and editorial room, are loudly claiming for their respective parties a monopoly of the praise due for the present prosperity of the nation. The former attribute it to the course of the Administration; the latter, to the action of the present Congress. Was there ever a stronger proof of the unscrupulous mendacity of this brazen-faced class than this assignment to political faction of the merit due almost exclusively to the agriculturists of the country? If the restoration of prosperity to the nation is indeed a valid ground for placing in control of the government the class that has been mainly instrumental in accomplishing it, then farmers to the front, and let us have a farmer President and Administration. Thus shall the farmers of the country perpetuate the prosperity they have created. But, alas! the millenium has not yet begun.

THE FINANCIAL STATISTICS OF THE COUNTRY make an excellent show. Although breadstuffs and cotton, our principal exportable commodities, have hardly yet begun to move, still gold is already flowing into the country from Europe at the rate of about $4,000,000 a week, $28,000,000 having been received from the first week in August to the beginning of this month. During September the public debt was reduced nearly $7,000,000, making a reduction of $26,000,000 since the commencement of the fiscal year, June 30 last. Since 1865 the debt has been reduced $900,000,000, and not only has the interest on this vast sum been saved, but that on the remainder has been greatly reduced by paying off the debt on which there was a high rate of interest, and, instead, borrowing money at a lower rate. To some, however, the justice and expediency of great haste in paying off the public debt are more than doubtful. It is done to lighten the burdens of future generations; but has not the present generation already done enough for those that are to come? Has it not poured out its blood and treasures profusely, chiefly for their benefit? And why should its industries be hampered by excessive taxation to pay a debt which they owe us, inasmuch as it was mainly incurred for their welfare, and which, with the inevitable development of the wealth of the nation and the rapid increase of its population, they will be better able to pay than we are?

THICK AND THIN SEEDING.

CONSIDERING the question of thin *vs.* thick seeding of grain, there is this to be said: Every garden, whether vegetable or flower, shows that those plants which have plenty of room are larger and more vigorous than those which are crowded. Even though the soil is no richer or even poorer, every part of the plant receives its due share of sun and air. The richer the soil, then, the *more* room within certain limits a given plant requires. To sow three bushels of wheat per acre upon strong land well prepared, would be to crowd the plants and thus to deprive them of the air, light and moisture necessary to their full development. Half, perhaps one-third, of that amount of seed would, under such conditions, furnish the plants with the needs of a healthy existence. We should then have larger stems, larger heads, heavier grain and an increased power of resisting diseases and the attacks of insect pests. The exact amount of seed which should be sown per acre, however, must so vary according to soil, preparation, climate and the characteristics of the varieties sown that, guided only in the avoidance of extremes by what we know of the laws of plant life, no rules can be laid down. It is a matter for each farmer who should know all about those conditions, to determine for himself.

AGRICULTURAL SCHOOLS.

THE agricultural colleges are complained of for not fulfilling the promises made for them of giving farmers or sons of farmers a practical knowledge of agriculture, and for not annually turning out a crop of educated youths who will make the wilderness blossom as the rose, to a profit as well as to beauty.

When Mr. Morrill proposed the bill giving aid to these colleges, the objection was made to him that it was not *colleges* but *schools* which the country wanted. His reply was that "one college in a State would be enough to furnish teachers and experimental operations, while the nation could not well assist the States in establishing schools. But," said he, "the States will second the enterprise by themselves establishing schools of the rudiments of agriculture and mechanical pursuits."

The question now occurs—is it not practicable to organize a system of schooling, or modify the present system, so that some acquaintance with the rudiments of soils and cultivation, as well as with fibers and materials and the use of tools and machinery upon them, will be taught? It is not the colleges which can be of use to the great number of young men, but schools may be, and it is believed to be as good discipline for a boy to be half of the day in connection with observations and the study of nature growing and dormant, as all day confined to the abstractions of books, as now practised.

IRISH AGITATION.

THE agitation in Ireland seems to be fast approaching a phase in which the Government must either make large concessions not only to the tenantry, but also to the politicians of the island, or else adopt strong repressive measures. The agitation against landlordism has combined with the agitation against British Rule—the Land-leaguers have "pooled issues" with the Home Rulers and Fenians, and the union has increased the boldness of the speakers at public meetings and inflamed the populace to more frequent deeds of violence against the persons or property of obnoxious landlords or of tenants who either pay rent when their neighbors refuse to do so, or are rash enough to take land from which the former occupiers have been evicted. Not a week passes without a murder or an attempt at one, and frequently two or three are perpetrated in different parts of the island within as many days. Resident landlords live in a state of constant apprehension for their own safety and that of their families and properties while deriving little or no income from their land, so that many of them are already on the verge of bankruptcy. Absentee landlords, while shifting the risks of violence on their agents, receive little but execrations and hatred from their estates, while both classes are threatened by a national strike against rents. Such a measure would inevitably bankrupt many of them and greatly incommode almost all; nor could the whole disposable force of the British army evict the tenantry of the country should they combine in their refusal. As usual in public commotions in that island, factions have already arisen, and the Protestants of the north are being vehemently urged, in the name of their allegiance to the British Crown, to arm and organize against the Catholics of the rest of the island. The present movement, however, is not confined to the adherents of any particular religion, for some of the bitterest and ablest of its leaders are staunch Protestants. At present serious trouble seems inevitable in the near future, and rebellion or revolution looms grimly in the backgrounnd.

OLD BUT GOOD.

ONE of the most interesting signs of our national prosperity is the lowering of the rate of interest in the West. A few years ago 10 per cent. was the usual rate at which money was loaned to farmers, and often even more was exacted either in the form of interest or a bonus for the loan, or as commissions or other expenses for procuring it. The wealth of the people, however, has increased so rapidly of late that the demand for this sort of accommodation has greatly decreased, and as the needs of the people have grown less, the exactions of capital have diminished. It is doubtful whether there has ever been a time when so much real money has been in the hands of the agricultural community there as at present. For the last three or four years crops have been excellent in quantity and quality, prices have been good always and sometimes very good, and previous distress has taught the people the advantages of economy, and made them careful in expending their accumulations. Mortgages in vast numbers have been paid off; new dwellings and barns have been built and paid for; farms have been greatly improved; better stock has been largely introduced; new furniture and household conveniencies have brightened the homes and lessened the toils of thousands of families. The crops and the prices this season also promise to add to the general prosperity, and all signs are hopeful that after this year the number of industrious, wide-awake farmers will be comparatively small, who can apply to themselves our earnest advice, reiterated often at this flush season—"Get out of debt."

GOING TOO FAR.

DURING the past year the starving settlers in Western Kansas have been loud in their complaints of the misrepresentations by which railroad companies had induced them to immigrate into that arid region on the assurance that the land and climate were admirably adapted to farming purposes. Confiding in these protestations, thousands abandoned their old homes, with their fond memories and friendly associations, and journeyed to the Land of Promise in the Far West. In hundreds of cases they went too far, however, and encamped in the desert beyond, where for the last couple of years their labors have failed to give them even a scanty livelihood, and had not help come from the prosperous parts of Kansas and the neighboring States, the newcomers who could not get away, would have found graves instead of homes in the land of their adoption.

It is not unlikely, however, that this region, which with its Buffalo and other wild grasses is even now the great grazing range for the vast herds of the West, may yet be brought under successful tillage; but, if it shall, it will probably be at the cost of many years of severe labor on the part of successive bands of transient settlers. The waves of westward immigration, breaking on the edge of the "Great American Desert," will recede and again advance, gaining a little on the waste on every return. Just as on the shore of the ocean, too, the advancing tide often forms pools in favorable spots ahead of the line of incoming waters, so small areas of the "desert," which springs or streams may render less inhospitable than the surrounding waste, will doubtless be permanently settled in advance of the general line of colonization. But in view of the large tracts in every way well adapted for agricultural purposes, that still remain unsettled, not only in all the frontier and most of the Western States, but here and there also in the Middle and Eastern States and still more in those of the South, the wisdom of facing the grievous hardships that must be endured by the pioneer subduers of the waterless regions west of the 100th parallel, is more than doubtful, and the morality which for selfish greed tempts the ignorant to the venture by all manner of alluring devices, is worthy only of the soulless corporations that practice it.

Even for those for whom the promising future of Kansas has an irresistible attraction, there still remain open to settlement large tracts of land in every way excellent for farming purposes in that State east of the "desert" line. Into this world of ours thousands have been born on this and the other side of the Atlantic, whose arduous mission it seems to be to act as pioneers beyond that line and fit the country for more steady but less enterprising citizens, and to those among these who intend emigrating westward before the others have accomplished their mission, we would say in warning tones: "In going West, as in other affairs in life, don't go too far."

BREVITIES.

IN husking Chester Corn we have found one ear with 28 rows and 69 kernels in the row. The ear is just one foot long and nine inches in circumference in the middle.

IN England we see that there are two kinds of variegated tulip trees offered for sale. One has a yellow-blotched leaf, the other a yellow-margined leaf. Both kinds are said to be as hardy as the type, and very handsome. We are not aware that these have been offered by American nurserymen.

THE new potato, Magnum Bonum, is well thought of in England, where it originated. Mr. Rose, of this country, has a new and valuable seedling which unfortunately he has also named Magnum Bonum. He sent us a box in the Spring for seed, which was planted at the RURAL GROUNDS. The yield has been heavy—the quality is good.

THERE are pretty strong indications that the price of wheat will be good this year, and as seen by our market reports elsewhere, quotations have already a decidedly upward tendency. At home the surplus, it is believed, will not be so great as was anticipated earlier in the year, as the crop has not thrashed out as well as was expected.

THE export of apples increases in magnitude as the season advances. For the present week we learn of freight contracts from this port for about 13,000 barrels for Liverpool; 900 for London; 3,000 for Glasgow, and 15- for New Castle, and doubtless the Continental lines also will engage in the business. The White Star and Inman lines have the bulk of the contracts for Liverpool. The ocean freight to all the trans-Atlantic ports is four shillings or one dollar per barrel.

OUR benevolent friend, the A. A. in a conspicuous manner declares that its hints and suggestions *are never copied from previous years*, but are freshly prepared for every month. Nevertheless it copies, *verbatim et literatim* from October 1878, a large number of the hints, etc., given for 1880; and in doing that furnishes in itself a conspicuous example for its own column devoted to humbugs. But it is not *this* sort of humbug that the A. A. finds it advantageous to expose. There is no money in it.

THERE are many vines that are attractive for special features; but in all respects, for this climate, there is none more desirable than the honeysuckle. It has not a fault. Its flowers are fragrant and charming. Its foliage is ample, half evergreen, bright and pleasing. It will make a thing of beauty of an old stump—a neglected corner. It will clothe an arbor, trellis or piazza with its thick-growing, slender stems, and its delightful perfume will be grateful to passers-by. Of all honeysuckles, no other is more desirable than Hall's Lonicera Halleana.

ONE of the finest beds of flowers we have ever cared for was one of seedling geraniums (pelargoniums,) about 45 feet in circumference. The plants were pictures of health during a hot, dry Summer and this luxuriance was due, we believe, to a mulch or covering of grass renewed twice or thrice during the season. This was strewn over the soil between the pelargoniums soon after it had been cut, about two inches thick. Being fine and short it soon dried, becoming sufficiently matted together to keep it in its place. This, besides suppressing the growth of weeds, acted as a cooling shade to the soil and a preserver of the moisture beneath.

BLESS us, how pleased we shall be when election is over! We saw the other day two fine hickory trees to be used as "liberty poles" that had been cut down by a farmer in the vicinity of the Rural Farm. It occurred to us—especially as we know he is not a very successful farmer—that he might have been better employed. Farmers cannot afford to waste their time over politics. It is well to talk of patriotic motives and all that. But patriotism lies in the direction of making the farm pay and the farmers' families comfortable and happy. As for the average political paper, there is no truth in it, and farmers could determine as well whom they should vote for if they never read a line of its pages.

WHILE the rapidly increasing manufacture of glucose is a benefit to farmers in that it affords a growing market for their corn, the abuse of the manufactured product is becoming a serious injury to them as well as to the rest of the community. Analyses made in different parts of the country show that the adulteration of sugar by glucose is largely on the increase. If the glucose were pure, no effects injurious to health would result from its use; but as its sweetening capacity is considerably less than that of cane sugar, its employment would be a fraud, inasmuch as it is estimated that fifty cents' worth of corn would produce five dollars' worth of sugar at present prices. Moreover, the glucose used as an adulterant is rarely pure, and consequently is generally unhealthful, causing dyspepsia and similar disorders. Formerly the presence of glucose in sugar could be detected by a sticky feeling, so that granulated sugar might be considered free from it; but the art of adulteration has made such strides of late that now fine-looking specimens of granulated sugar are found on analyses to be badly but skillfully adulterated with the product. Nearly all candies and other "sweet-stuffs," as well as honey and nearly everything into whose composition sugar enters are similarly adulterated, and from the frauds thus perpetrated on the public the farmers are as great sufferers as the rest of the community.

Literary Miscellany.

THE MINISTER'S DAUGHTER.

JOHN GREENLEAF WHITTIER.

In the minister's morning sermon
He had told of the primal fall,
And how thenceforth the wrath of God
Rested on each and all.

And how, of His will and pleasure,
All souls, save a chosen few,
Were doomed to the quenchless burning,
And held in the way thereto.

Yet never by faith's unreason
A saintlier soul was tried,
And never the harsh old lesson
A tenderer heart belied;

And, after the painful service
On that pleasant Sabbath day,
He walked with his little daughter
Thro' the apple-bloom of May.

Sweet in the fresh green meadows
Sparrow and blackbird sung;
Above him their tinted petals
The blossoming orchards hung.

Around on the wonderful glory
The minister looked and smiled;
"How good is the Lord who gives us
These gifts from His hand, my child,

"Behold in the bloom of apples
And the violets in the sward
A hint of the old, lost beauty
Of the garden of the Lord!"

Then up spake the little maiden,
Treading on snow and pink:
"Oh Father! these pretty blossoms
Are very wicked, I think.

"Had there been no Garden of Eden
There never had been a fall;
And if never a tree had blossomed
God would have loved us all."

"Hush, child!" the father answered,
By his decree man fell;
His ways are in clouds and darkness,
And He doeth all things well.

"And whether by His ordaining
To us cometh good or ill,
Joy or pain, or light or shadow,
We must fear and love Him still."

"Oh, I fear Him!" said the daughter,
"And I try to love Him, too;
But I wish he was good and gentle,
Kind and loving as you."

The minister groaned in spirit
As the tremulous lips of pain,
And wide, wet eyes uplifted
Questioned his own in vain.

Bowing his head, he pondered
The words of the little one;
Had he erred in his life-long teachings?
Had he wrong to his Master done?

To what grim and dreadful idol
Had he lent the holiest name?
Did his own heart, loving and human,
The God of his worship shame?

And lo! from the bloom and greenness
From the tender skies above,
And the face of his little daughter,
He read a lesson of love.

No more as the cloudy terror
Of Sinai's mount of law,
But as Christ in the Syrian lilies
The vision of God he saw.

And as when in the clefts of Horeb
Of old was His presence known,
The dread Ineffable Glory
Was Infinite Goodness alone.

Thereafter his hearers noted
In his prayers a tenderer strain,
And never the gospel of hatred
Burned on his lips again.

And the scoffing tongue was prayerful,
And the blinded eyes found sight,
And hearts as flint aforetime,
Grew soft in his warmth and light.

INMATES OF LESTER HALL.

(Continued from page 678.)

CHAPTER X.

"NOT handsome?" had been Cecil's mental verdict at her first glance at Dr. Lawrence, but now she was inclined to alter it, for there was something peculiarly attractive in his appearance—in the proud turn of the head, the tall, strong form, the keen gray eyes; and the mouth, shaded though it was by his heavy moustache, was a beautiful one, firm and resolute, yet tender and refined. There was something, too, in his manner which Cecil liked, although it piqued her not a little to see that he seemed quite indifferent to her presence—something strong, yet tender—imperative, yet gentle—and some feeling rose in the heart of the young girl that she would like to have such a man at her feet; that such a conquest would be a greater victory than any other she had yet achieved. Certainly no other man had appeared so heedless of her beauty as this big, unimpressionable doctor.

"How is your patient, Lawrence?" said Mr. Edgar's voice at this juncture, at the half-open door, and the doctor turned from the window and looked at Cecil with a smile, which was partly in his eyes and partly in his mouth, and which was a singularly pleasant one.

"She is better. You may come in, Edgar," he said. And Mr. Edgar came in, and began expressing his regret at the accident.

"I never was so vexed at anything," he said, eagerly. "I have been abusing those idiotic grooms by way of relieving my feelings; but it has not done much good. Lawrence, if Miss Cecil is equal to coming in to dinner, you shall have the honor of taking care of her."

"She is quite equal," said Cecil, smiling. "Perhaps Dr. Lawrence thinks that he has had sufficient trouble with me already," she added, gaily, as she put her hand through the doctor's arm. "Nevertheless, he shall, as you say, Mr. Edgar, have the honor of taking me in to dinner. Do you object?"

He only answered her by one glance of the gray eyes—but under that glance her own eyes fell! She had been too well accustomed to admiration both expressed and understood, not to read it at a glance, and generally she heeded it but little; but there was that in his eyes which told her that his admiration was not merely the ordinary feeling her beauty seldom failed to exact, but something far deeper, something which might strengthen into love!

Sir Edgar's dinner-party was a brilliant one; the guests were numerous and well selected; the dinner, of course, perfection; the host himself was in the highest spirits, while his eyes so frequently sought Mattie's face with an eager glance, that it was no secret to any of the guests what his feeling towards her was.

To Cecil Lester, and to the man seated beside her, the dinner was evidently a pleasant one. She was pleased to be charmingly gracious, more gracious than anyone present could remember having seen her before—and Dr. Lawrence had no power to resist such witchery as hers. It may be that once or twice, as his eyes fell on her matchless loveliness, he thought of the madness it would be to love her—he, a physician, not unknown perhaps, but as yet with little wealth or fame, but he forgot all prudence in the magic of her society, and all his reserve melted as ice before the sunshine; and although he kept his quiet, reserved manner, his eyes spoke all that his lips left unsaid.

When dinner was over, and they were sauntering up and down the terraces and gardens, he lingered still by her side, intoxicated by her wondrous beauty and grace, heedless of his danger, feeling only that he was happier than he had ever been in his life, and without pausing to analyze his happiness. And indeed Cecil herself was almost irresistible that night. There was on her an infinite gentleness, a gracious sweetness, which had a wondrous charm. All her haughty coquetry seemed to have fallen away from her.

There was that old-world deference and veneration in the Doctor's manner, which brought out Cecil's better nature, and drove away all her pride and indifference. He talked well—his conversation was not that vapid, empty, even if sometimes brilliant, society small talk. He spoke of life as it is, real and earnest; he gave her, quite unconsciously, glimpses of his own life, brave, self-denying, and laborious. He spoke on many topics; and even those on which Cecil spoke lightly and brilliantly, with half disdain, half satire, he touched upon earnestly, as if in all things to him there could be no half measures, and Cecil thought she read a frank, loyal nature, which had nothing to conceal.

"I may see you again, perhaps," he said, as she gave him her hand in farewell.

"I hope so."

He stood bareheaded as the drag drove away; and even for some minutes after it had disappeared he remained there looking in its direction, lost in thought. And as he drove away in his brougham he was haunted by the perfect loveliness of Cecil Lester's face.

"How do you like my friend the doctor, Miss Cecil?" said Mr. Edgar, as they drove back to town.

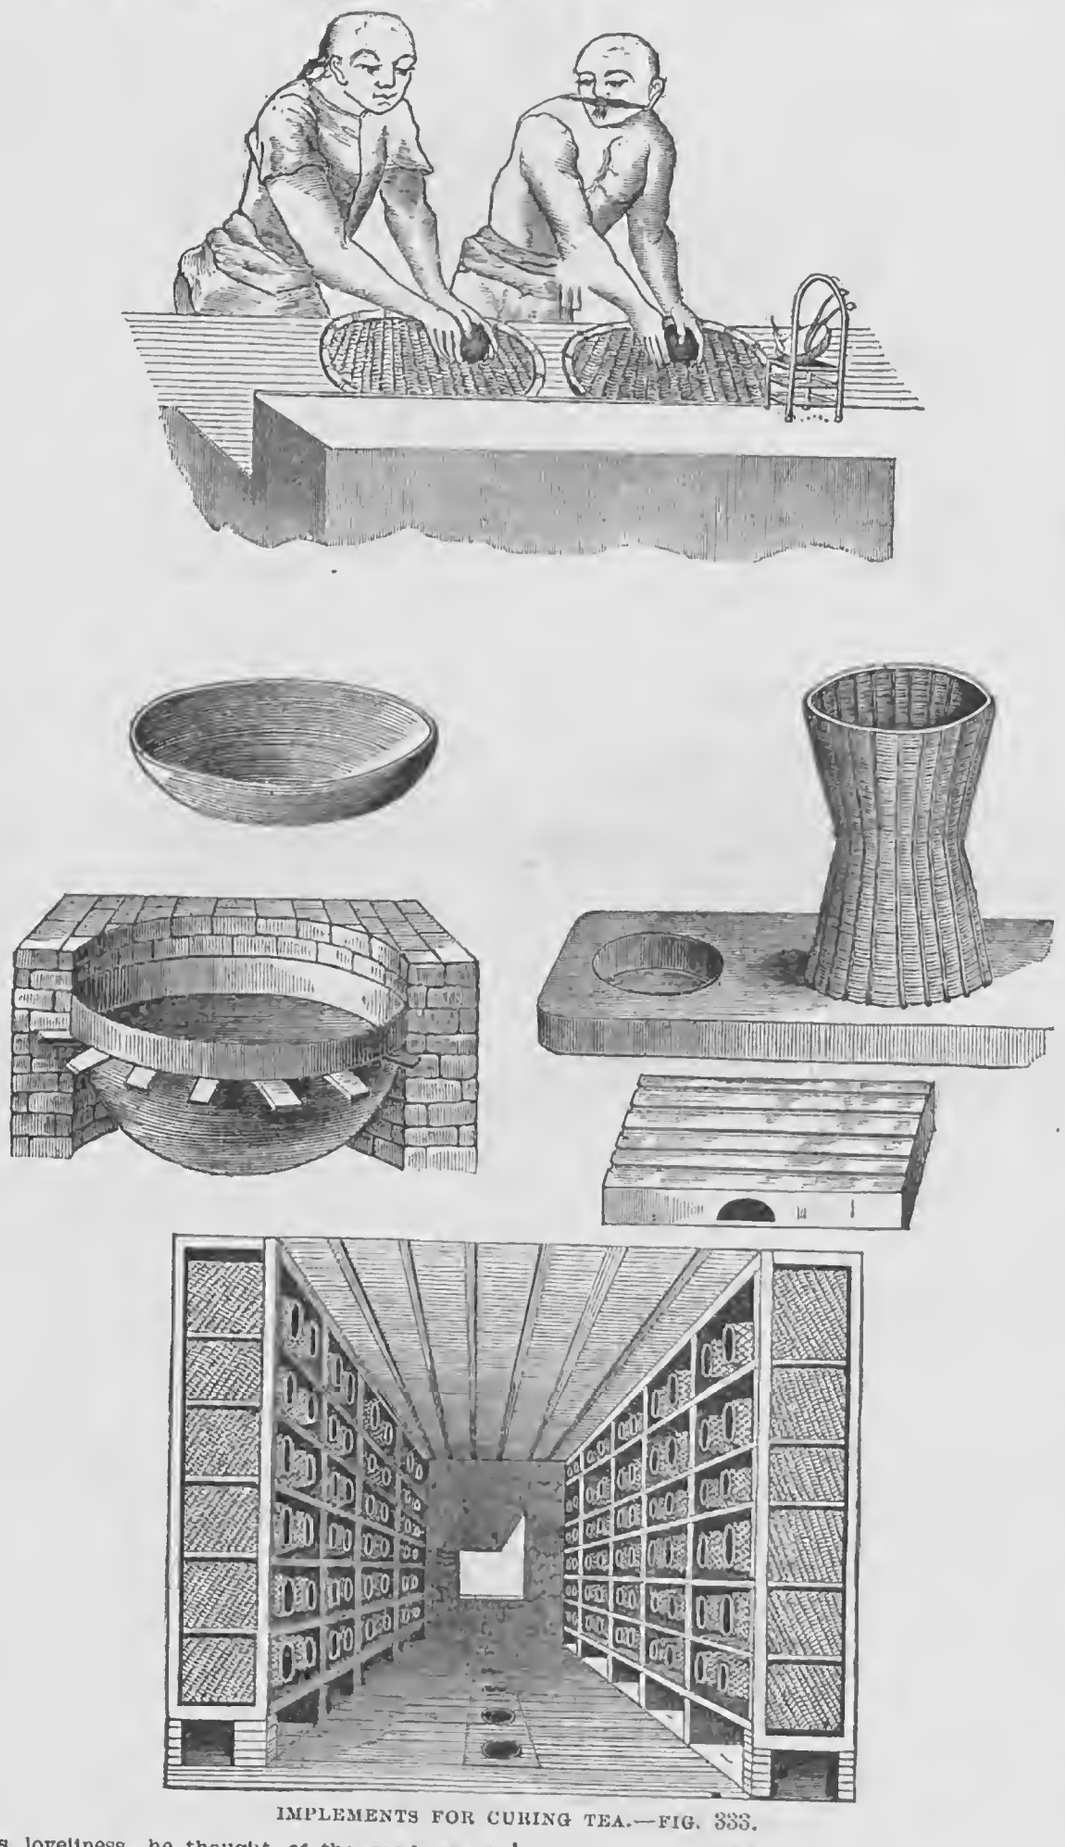
"He is very pleasant," said Cecil, languidly, although there came a faint rose-flush in her face as she spoke.

"Pleasant! he is one of the best fellows out," said Mr. Edgar warmly. "The finest fellow I know is Lawrence Carewe, whatever his past life may have been."

There was a moment's silence, then Cecil said, calmly:

"What name did you say, Mr. Edgar? I fancied his name was Lawrence.

"So it is," replied Mr. Edgar; Lawrence Carewe."



IMPLEMENTS FOR CURING TEA.—FIG. 333.

CHAPTER XI.

TEMPTATION.

"I believe the wisest thing for me to do would be never to see her again."

Dr. Carewe was standing in his study, holding the invitation to Mr. Daton's ball between his fingers as he made the above remark, debating with himself whether he should go to this entertainment, although he was dressed and the carriage was waiting to convey him to it. He had accepted the invitation without hesitation at the time of its arrival, but in the week which has elapsed he has repented that acceptance.

On three several occasions he had met Cecil Lester since his introduction to her at Mr. Edgar's Richmond dinner, and the wonderful charm she had exercised over him on their first acquaintance had deepened and grown stronger. The quiet, even tenor of his life was completely disturbed; he was restless, unhappy and absent. He could no longer take pleasure in the pursuit of his profession, which had been his greatest joy; his studies palled upon him; he, hitherto the most practical of men, had become dreamy, living two lives, heeding little how time went or what he did. He, who hitherto had no time to fall in love, as he had said carelessly in the past, now fell a captive to a sudden passion, strong as it was imprudent, mad as it was irresistible.

"Shall I go or shall I not go?" he muttered to himself, as he paced up and down the study; and as my readers will readily surmise, the answer to his question was in the affirmative, and Dr. Carewe went out of his house, entered his brougham and drove to Mr. Daton's.

The ball was at its hight as he entered; numerous as had been the invitations issued and accepted, the house of the merchant prince had ample accomodation for his guests. It was a magnificent *fete*; no pains or money had been spared to make it a success, and the gold spent so lavishly had done what had been asked of it. Everything possible to add to the enjoyment of the guests had been procured, and the guests were enjoying themselves as much as it is ever possible for those belonging to the *creme-de-la creme* of society to do.

One object the ball certainly succeeded in if it had been meant to do so, the betrothal of Mr. Edgar and Miss Lester was made publicly known thereby, for Cecil had been correct in her assertion that "Richmond was an excellent place for that kind of thing." When on that evening Sir Edgar had spoken of his love to Mattie, she had not repulsed him; and Mr. Daton's consent to their engagement had been cordially given.

Mattie was discharging her duties as hostess, very gracefully, but a little languidly, for she was tired; and having lately caught a troublesome cold, which had ended in her cough, was not quite in her usual health, although she seemed very happy in the society of her happy *fiance*.

Around Cecil, as was usual on such occasions, clustered a little court of admirers, more eager, more sedulous, more devoted than around any other; and the young girl herself was queening it with all her usual grace and haughtiness. Dr. Carewe watched her from where he stood and marked her great beauty with eager, longing eyes, wondering how he had ever dared to hope or dream that he might possess it.

She was dressed in white silk, which fell around her in heavy, lustrous folds, with rich soft lace about it; and pearls of great beauty and value were twisted round her throat and in the masses of her bronze-brown hair. There was not a spot of color about her, save in the red lips, and she looked wondrously beautiful.

"Ah, Dr. Carewe! is it you?" she said, carelessly, as Lawrence made his way to her side; and as he bowed low in answer to her indifferent greeting, she continued her vivacious conversation with a young man of great wealth, who was her latest victim. Although for a time she took no further notice of him, Dr. Carewe stood watching her, wondering at the dazzling glitter of her wit, the brilliance of her intellect, as those around her vied with each other in vivacity and quickness of repartee. Soon she dismissed her court and with a slight motion of her fan signed Dr. Carewe to her side.

"You don't care for dancing?" she said, with a smile. "You give fresh air the preference. Will you care to come out on the balcony?"

"Will I care?" he said, softly, under his breath; and as she laid her hand lightly on his arm and felt the quick throb of his heart, the proud, lustrous eyes darkened, as if with some sorrowful or scornful thought.

"You came late," she said, glancing at him with a slight smile, as she sank on a low-cushioned seat among the flowers of the balcony. "Were you detained by patients?"

"No," he said, calmly.

"Why did you not come earlier then?" she said, imperiously.

"You do me too much honor in taking such an interest in my late appearance," he said, trying to speak with indifference, but with a tremor in his rich, deep tones.

"Show me that you appreciate the honor by giving my question an answer," said Cecil, smiling, and letting her glance dwell upon him for a moment, the lustrous eyes meeting calmly—almost mockingly, it would seem, the passion in his own, as they looked down at her.

"I was undecided whether to come or stay away," he said, hurriedly. "It would have been prudent to have done the latter, but——"

"But, what?"

"But I did not, you see!" he rejoined, with a little bitter laugh; "although Heaven knows it would have been wiser to do so!"

"Why would it have been wiser?" she said, looking at him through her long lashes.

For a moment he did not answer—perhaps he was afraid that if he spoke the burning love he felt towards her would have found utterance; then he said, half lightly:

"What has a musty old doctor in common with such a scene as this? He would feel more at home by a death-bed!"

"Even if it were through his fault that one lay there!" she said, without looking at him, with a tone in her voice which was new to him.

He looked at her in some surprise, and for a moment answered nothing; then she rose from her seat, and moving across the balcony, leaped over the side, toying with the flowers.

In a moment he joined her.

"Do you think death the most cruel thing that could happen to one we loved?" she said, abruptly.

"No," he answered, musingly, "I can imagine worse even than death."

"Yes," she said, suddenly, "disgrace and shame!"

There was a bitter intonation in her tone which struck him; he glanced at her with some painful feeling in his gaze.

"Ay," he answered, "and the unworthiness of one we love."

"Even so," she said, with strange intensity. "That is the bitterest suffering of all."

He drew a step nearer to her as he stood by her side.

"You can have never known that suffering,"

he said, gently. "Heaven keep you from ever doing so!"

"I will never know it," she said, with a strange little laugh. "Because——"

"Because I shall never love!" she answered, coldly.—To be continued.

MAGAZINES FOR OCTOBER.

HARPER'S MAGAZINE.—Contents: The Ascent of Fujiyama; Illustrations — Fujiyama, from the Otomitona Pass—The Crater of Fujiyama—The Morning Shadow of Fujiyama—Pilgrim's Rest; Art-Needlework; Keats—A Sonnet; Reminiscences of John James Audubon; A Romance of the Hebrides; An Autumn Holiday; A Demon-Hunt with St. Hubert in Touraine; Does Farming Pay? A Poem; The Metropolis of the Prairies; White Wings—A Yachting Romance; The Throckmortons—A story; Some Peculiarities of Turkish Politics; Washington Square—A novel; Is it all there Still—A poem; "Bad Peppers."—A story; A Buddhist Vision—A poem; Modern Bee Culture; Morning and Evening by the Sea—A poem; The "Sophia Walker;" Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record; Editor's Drawer.

A ROMANCE OF THE HEBRIDES.—The world, even in its hero worship, is a discriminating world. It indeed loves all greatness, but it dearly loves successful greatness; and it is not to the martyrs of "lost causes" that it sings anthems and erects monuments. Even among the ranks of this abortive chivalry it exercises a partial respect. The honorably born have more than their just share of honor thrust upon them; those of humbler birth are often mulcted of even that fair proportion which they have too well earned.

Such reflections as these, mingled perhaps with some indignation, must force themselves upon the hearts of all who stand once in a lifetime within the beautiful kirk-yard of Kilmuir, and look over "cloudy seas" and the bold islands of the Hebrides. For here, on this lonely hill, without a stone to mark her grave, rests the bravest and the fairest of the Macdonalds; the devoted adherent of the Stuarts against the house of Hanover in England; the eager partisan of the house of Hanover against the colonists in America.

It was in 1853 I stood within the ruinous family mausolcum of the Macdonalds of Kingsburgh. Anxiously I pushed aside the high thistles to look for some remnant of a headstone that her sons had placed above her grave in 1790; but every particle had been carried away by admiring pilgrims, and its only guardian was the somewhat remarkable growth of Scotch thistles that not inappropriately shook over it their purple blooms.

"Why is there no monument to Lady Flora?" I asked of the "black Macdonald" who was our guide.

"Is it ta stone ye mean, ma'am? Ta daisies and ta thistles are a heap ponnier. Yes, intect."

But, for all that, it was impossible to avoid contrasting this ruinous plot and its neglected grave with the splendid cathedral of S. Pietro, in Frascati, where in a coffin of cypress-wood, with the crown, secptre, and sword of his race, rests the man whose life Flora Macdonald risked her own to save. For the Prince, the high altar of the cathedral, and a costly marble monument in St. Peter's, Rome; for the simple clanswoman, an unmarked grave on a Hebredian hill.

But though Lady Flora is gradually slipping out of history—in spite of Dr. Johnson's propheey—there is a sentiment of admiration for her wonderful life and character which quietly passes on her name from generation to generation.

THE ECLECTIC MAGAZINE.—Contents: Steel Engraving.—Robbins Reef Light, New York Harbor; Hours in a Library—Sterne. By Leslie Stephen; Peasant Life in Bengal. By J. Talboy Wheeler; Lotters to and from Hans Christian Andersen; A Scandalous Romance; A Reindeer Ride through Lapland; Fiction, Fair and Foul. By John Ruskin. II; The Carver and the Calipa. By Austin Dobson; Jelly-Fishes. By Andrew Wilson, F. R. S. S. Central Asia; The Meeting-place of Empires; Thoughts in a City Church; White Wings; A Yachting Romance. By William Black; Minuets; Romance of Literary Discovery; In Memoria; Tom Taylor. By Thomas Hughes; The Blackbird. By W. W. Story; Instances of Longevity Bitter-Swect; Literary Notices; Foreign Literary Notes; Science and Art; Varieties.

DESTRUCTIBILITY OF HUMAN BONES.—An instance of the readiness with which human bones disappear is shown in the fact that the Dutch Government in 1843 drained off the great Haarlem Lake, on which there had been many shipwrecks and naval fights; and where thousands had found a watery grave. The canals and trenches dug to a considerable depth through the rescued land are estimated to have an aggregate length of thousands of miles, and yet not a single human bone was exhumed from first to last. Some weapons and a few coins and one or two wrecked vessels alone rewarded the efforts and researches of the curiosity-hunters. Here, as in cavern deposits and river gravels generally, works of art alone furnished evidence of the existence of man, even though no part of the deposit could be more than 300 years old, as the lake was formed by inundation toward the end of the sixteenth century.—Eclectic Magazine for October.

THE AMERICAN NATURALIST.—Contents: The Food of the Darters; On the Former Extent of the Triassic Formation of the Atlantic States; Notes on Stone Implements Found in New Jersey; Some Noteworthy Birds; On the Microscopic Crystals Contained in Plants; Editor's Table; Recent Literature; General Notes; Botany; Zoology; Anthropology; Geology and Paleontology; Geography and travels; Microscopy; Scientific News; Proceedings of Scientific Societies.

SOME NOTEWORTHY BIRDS.—That was a memorable event in the annals of bird lore when those Arctic owls made their remarkable raid upon us in our centennial year. What it was that induced *Nyctea nivea* to make that visit in such numbers after the big show was closed, and the world's folk had left, may be a question. Probably the commissariat was under consideration; in which case our snowy owl had grave reasons for his coming. Winter is hardly a prime season for delicacies in the larval line, and the construction may seem awkward, yet it will bear assertion that these birds of Pallas were after grub. Though bold, Nyctea did not put on style. It was simply that sort of personal bearing which comes of innocence. In the Northern cities he even perched on chimney-tops, and in rural places was familiar with men, even unto rashness. Our farmer friend, his family filling the large carry-all wagon, was on his way to church, when lo! by the roadside, "a sitting on a rail," was one of these Arctic owls. No man is himself at all times, and our good friend's piety was sorely tried, for the strange bird actually ogled at him with its big brass-button eyes. He would have railed at the bird; He was on the fence what to do. It is Sunday. Shall he send Thomas back for the gun? The wife suggests they'll be late to meetin'. The bird owes his life to that good woman. In the markets of New York these owls were suspended in strings like poultry. Upon inquiry, Terence was told that they were Spanish geese. "Sure then, for a goose, it has an uncommon knowing face." To many a village "bird-stuffer" in the Eastern States, that Winter of '76 brought a large increase of business. In not a few parlors of my acquaintance, a snowy owl became a fixture, and was pointed to as an avian prize. But our splendid bird has become unable to uphold its reputation. The tidy housewife charges it with bringing in that tiny reprobate, the clothes moth, *Tinea flavifrontella*, it of the yellow face, which after plucking Nivea in spots, finishes on the rep upholstery. A young friend captured one of these Arctic raiders alive. So long as he was well supplied with mice, the bird was quite good natured, and even submitted to the caresses of his master; but the young man found the demands of that hungry maw very exacting; in fact that owlish stomach was too capacious for him to fill, so he killed the bird in order to have it stuffed.—Samuel Lockwood, Ph. D., in Am. Naturalist for October.

VARIETIES

THE only way to have a friend is to be one.

Prejudices are like rats, and a man's mind like a trap; they get in easily, and perhaps can't get out at all.

NEVER does a man portray his own character more vividly than in his manner of portraying another's.

Rome, Italy, now spends $200,000 yearly on its public-schools, and at the beginning of this decade they had none.

In Sweeden nearly two thousand "school gardens" have been established as instruments of useful scientific education.

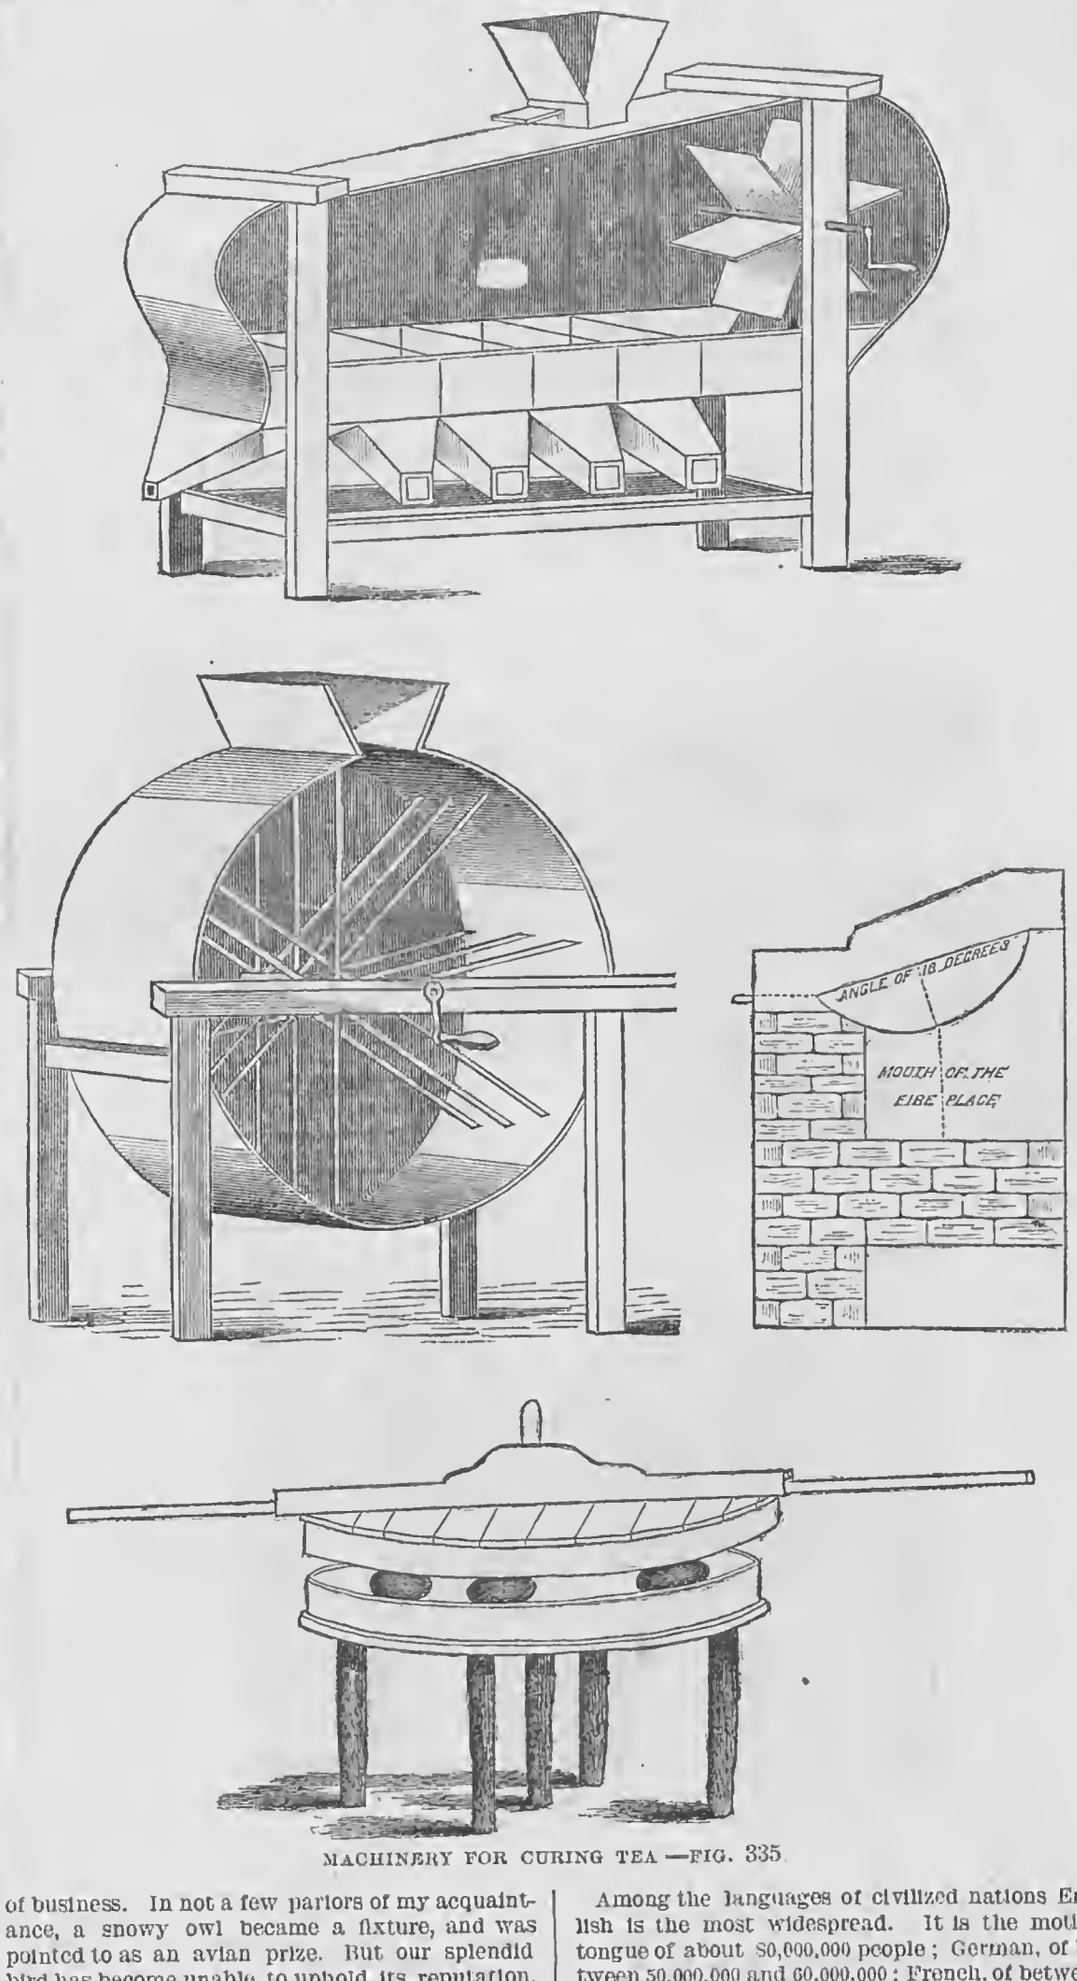
He who is false to a present duty breaks a a thread in the loom, and will see the defect when the weaving of a life-time is unrolled.

Prof. Henry Draper has stated facts which seem to point to the conclusion that it is not improbable that the planet Jupiter is still hot enough to give out light.

German manufacturers have found another use for paper. They make stoves of that material, in which the fire blazes cheerfully without the slightest injury to the paper enclosing it.

No man should be so much taken up in the search of truth, as thereby to neglect the more necessary duties of active life; for after all is done, it is action only that gives a true value and commendation to virtue.—Cicero.

No less than six nations are now engaged in Arctic explorations, chiefly by means of advance stations. Denmark, Russia, Austria, the United States, Germany, and Holland all propose to establish stations in the Arctic regions as a basis for future research.



MACHINERY FOR CURING TEA.—FIG. 335.

Among the languages of civilized nations English is the most widespread. It is the mother tongue of about 80,000,000 people; German, of between 50,000,000 and 60,000,000; French, of between 40,000,000 and 50,000,000; Italians of 28,000,000, and Russian, of between 55,000,000 and 60,000,000.

A DESERVED REPROOF.—Even in this age there are still left some ladies who know what is due to their own dignity. We give an anecdote illustrating this: A certain gentleman had for some time admired a certain lady without knowing her. She had been informed that he desired to know her, and it chanced one day that they met at the house of a friend and were introduced. Exhibiting his sudden sense of satisfaction at the encounter, he darted eagerly forward, and with hands extended, exclaimed, "Happy to meet you, Miss F——; delighted to make your acquaintance." The lady suffered the pendant hand to lie before her as she replied, "You haven't made it yet, sir," giving him to understand that the acquaintance of a lady is not made from a single introduction, nor is her hand to be shaken as if it were a Chinese puzzle. It is to be hoped that the over-bold youth profited by the lesson.

For Women.

CONDUCTED BY MISS RAY CLARK.

TRUE AND FALSE ECONOMY.

I THINK we often make a mistake on the score of economy in the matter of home-made articles. We are apt to congratulate ourselves on the great "saving" we have made in some such enterprise, when in fact, it was a pretty dear bargain.

Passing by the vexed question with regard to the economy of rag carpets, I can't help thinking my friend's home-made, white counterpane was a rather costly affair. There was the first cost of the materials used, coarse, unbleached muslin, and balls of candlewick—the sum would certainly have been half enough to buy a pretty Marseilles spread, which would have been handsomer and more serviceable and far more easily laundried.

Then came the long, tedious process of making. If a woman's time has any money value, it would far more than cover the remaining cost of the bought counterpane.

So the many pieced quilts, which so abound in country places—are not really so economical as seems at first glance, nor really so comfortable as good woolen blankets.

Where they are put together as a pastime, they make very pleasant fancy-work for leisure minutes.

If anyone "takes comfort" in these homemade manufactures, then they become really valuable, even though they are expensive luxuries.

The way to take our recreation is in the manner we like, not in the way that suits some other person.

But young ladies, anxious to save time for self-improvement, would do well to buy, rather than make most of their fancy articles. It takes almost as much money to buy the wool for a knit shawl, as to buy the article itself; and everyone knows how nearly endless is the task of knitting one. So, too, of the many trimmings wrought so laboriously with the crochet needle, you can buy prettier Hamburg edge at almost the cost of the materials.

A few neat collars and cuffs bought at a trimming store, will have a style and finish that cannot be given them when manufactured at home and more real satisfaction is gained and days of worrying saved.

Learn to take the value of time into the account in estimating the comparative economy of home-made articles over those you buy.

What is economy for one person, under some circumstances, is extravagance in another.

Cases in point may readily be recalled. For some house-keepers with neither chick nor child to take up their time, it may be all very well to sit down day after day to the piecing of silk quilts and chair and sofa covers, but for busy, over-taxed mothers, it would be too expensive a luxury.

When working-women learn to buy ready-made clothing more generally, they will have taken an advance step towards their emancipation, and will no doubt, add years to their lives. LOIS.

THE GOLDEN MEDIUM.

No mistress who regards her authority can afford to treat her servants with undue familiarity; neither should she regard them as inferiors; but there is a golden medium to be obtained. Treat your servants with confidence and consideration, and do not suspect them of doing wrong. They must be trusted more or less by the whole household, and trust, in most cases, begets a sense of responsibility. Require careful performance of their duties, strict obedience to your orders, tidiness and cleanliness in their persons, respectful manners and willing service, and make them understand how much their good conduct adds to the comfort of the whole household. They must have time to do their washing and keep their clothes in order, or they cannot be clean and tidy. Treat them with kindness, but never with familiarity. Don't ask unnecessary questions. If they are sad and moody, take no further notice of it than to suggest if (practicable) that the usual holiday hours should be taken on that day, rather than on the one appropriated to them. Without wholesome intervals of amusement, uninterrupted work becomes intolerable. For that reason, servants should be allowed to receive friends, and even lovers, in the evening, when the day's work is done. If you deny them the privilege of companionship, you establish an unnatural condition, which is a premium for deceit and worse than deceit. Servants will have male friends. Do not compel them to hide in areas, or to make appointments, but let everything be honest and above-board. There are and must be different modes of pleasure and enjoyment, and in the gratification of wants and wishes, but there is a common womanhood. Let us remember this gratefully, and feel how much it is in the power of every mistress of a household to elevate those she employs. "Good mistresses make good servants."

INTERROGATIVE.

DID you ever hear a woman say that she found no time for reading, and then see the same woman fretting away her time on patch work and other silly trifles?

Did you ever see a woman lay in a good stock of currant and elder-berry wine; use cider daily, on her dinner table, and then mourn over the slow progress of temperance reform?

Did you ever hear a man express his aversion to "strong-minded" women, and still show a decided fondness for discussing politics and other current topics with an intelligent female friend, to the utter neglect of his dear domestic angel, who doesn't read the papers?

Did you ever hear a woman deliberately lie to her little child, about the most sacred mysteries of life, and still call herself a Christian mother?

Did you ever hear a minister discourse beauti-

fully and touchingly upon our duty toward our brethern who are not favored with earthly riches; speak so truthfully and tenderly of our equality in God's sight, and still have an evident partiality for the society of those of his people who possess the greatest number of loaves and fishes?

Did you ever know a man who would cheerfully and uncomplainingly squander twelve or fifteen dollars per year on tobacco, and yet would growl like a caged bear, if his weakly wife hired a little extra labor?

Did you ever know a professing Christian who prayed earnestly and persistently for the temperance work and workers, and yet would vote for "party" when there was a prohibition candidate in the field?

Is'nt consistency a raro jewel? ERMENGARDE.

THOSE HUSBANDS.

I see that husbands are taking a course of lectures from various sources, and I thought that I would have a word to say too. As to husbands waiting on their wives there is something to be said on both sides. A wilful, selfish, or indolent wife with an easy, amiable husband is capable of becoming a fearful domestic tyrant. When the wearing care of little children comes it is so easy to call on some one else to do this or that, or to amuse the children, and often a tired laboring man who enters his door at night, needing rest, finds that his labors have but just begun. So much is required of him—which he is too kind to refuse to do—that he is made a slave of, by means of his noblest qualities.

It is not always a man though, who becomes so situated. An affectionate wife whose delight it is to make those she loves happy, labors to please until her loving services are exacted of her as if they were a right; often unthinkingly it is true, but a woman is a drudge all the same, if her whole time is required of her, to be spent in pleasing others even her dearest friends.

All individuals whoever and whatever they are, have certain inherent personal rights which they should themselves respect and then others will do so also.

Men and their wives should be considerate, and reasonable in their requirements of each other in order to be happy. AUNT RACHEL.

TAKING LEAVE.

It is not easy to terminate a visit or call in a thoroughly easy manner. Some people do not know how to leave a room. It is painful to see them anxious to beat a retreat from a call or a visit, and yet apparently as unable to escape as rats in a trap, although nothing bars their egress, and all persons concerned would gladly dispense with their company. The art or science of departure, both from localities and positions, is worth studying in great as well as little matters, and calls for the exercise of tact. No visitor is likely to be popular who has not the tact to leave at the proper time, a house at which he may be staying. One of the greatest difficulties in bidding farewell to a host is to convey to him the impression that you have enjoyed yourself. Expressions of thanks for a pleasant visit are apt to have a stereotyped and conventional ring about them. A hospitable man likes to know that his friends have been happy; but when each of them mutters a sort of little grace on his departure, he feels that they are but paying him an ordinary social compliment. A smile, or a cordial pressure of the hand, is more eloquent than words.

WEDDING ANNIVERSARIES.

The following gives the time and names of wedding anniversaries:

First year—Cotton; Second year—Paper; Third year—Leather; Fifth year—Wooden; Seventh year—Woolen; Tenth year—Tin; Twelfth year—Silk; Fifteenth year—Crystal; Twentieth year—China; Twenty-fifth year—Silver; Thirtieth year—Pearl; Fortieth year—Ruby; Fiftieth year—Golden; Seventy-fifth year—Diamond.

ABOUT WOMEN.

It has been ascertained that Amasa Stone is the man who will give $500,000 to Western Reserve College, at Hudson, Ohio, if it shall be removed to Cleveland. At a meeting of the trustees, held lately, it was practically resolved to remove the college to Cleveland and to change the name to "Western Reserve University." The college already has an endowment of $250,000.

THE Princess of Wales is a picture of modest good taste as she walks the deck of her husband's yacht. She always wears there a plainly made dress of some dark color, with a sailor's hat, or a close soft hat, which is exceedingly becoming to her. Her little daughters are dressed in dark serges or simple cottons, and sailors' hats always crown their long, fair hair.

A WOMAN on a New Brunswick railway displayed rare presence of mind the other day. She was walking over a long and narrow bridge, when a train came upon her, and there seemed no way of escape. Instead of losing her head and jumping into the water, as many would have done, she deliberately lowered herself between the sleepers and hung there until the train had passed over her; then she drew herself up and resumed her walk. The astonished train hands gave her three cheers for her display of courage and muscle.

MRS. PRESIDENT HAYES is not dead yet, nor likely soon to be. But of her, while yet living, it may be said: "*nil nisi bonum.*" Just now she is president of a charming cottage in the beautiful grounds of the National Soldiers' Home, a mile or two out of Washington, where, amid fruit, flowers, books and innocent amusements, the first family in the land while the cool hours of this delightful Summer away. Mrs. Hayes is noted in Washington for one thing which seldom gets into print: "doing good by stealth." In this exercise of her religious principles, she knows no seasons—only need and suffering. Where there is a sick man or woman known to Mrs. Hayes, her carriage will be seen there afternoons, and "Jere," the coal-black coachman, who descended to this dynasty from the last will be found disguised as a ministering angel. From the modest suburban cottage, superb cream, rare peaches, pears, grapes, dainty pots of butter, every delicacy that its vicinage affords, finds its way, via "Jere" and the carriage, to the bedside of the afflicted. Mrs. Hayes' successor will have to be a very superior woman to fill her place.—Woman's Journal.

Purify the blood, Cleanse the Stomach and Sweeten the Breath with Hop Bitters.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

BETTER HELP IN OUR KITCHENS.

T. M.

The question was asked in the RURAL some time ago why girls to help in our kitchens were so hard to be found. The question was answered by some one saying it was false pride that kept so many girls from earning a living in that way, I agree with the writer; but, instead of the false pride belonging to the girls, I think it very often belongs to those who so much need help. I do not think the pride is false that will keep a young girl from doing work which is called drudgery and considered so degrading as to unfit her who engages in that kind of labor for taking her seat at the table with those for whom she works, or when her day's work is done for a place in the family room. I admire the pride that will cause girls to strive hard to be respectable.

But why housework should be called drudgery more than other kinds of labor, is what I don't understand. I know it requires much watchful care to prepare good food and keep a nice, comfortable home for a family; but, while it is constant labor, is it not much more healthful than many other kinds of work in which women engage? When I engage a girl to do our sewing in our house, I never think of asking her to take her meals in the kitchen while we take ours in the dining-room. I do not expect her to go in and out at the side door and at all times be treated as an inferior, and yet that is the way many kitchen girls are treated. Now, I don't blame any nice, bright girl for keeping herself out of the way of such treatment.

If we want good help in our kitchens (and I think if there is a place where good help is needed it is there), let us lay aside our false pride. Let us no longer call the work drudgery, but make our kitchens pleasanter and then find a good, intelligent girl; give her good, reasonable wages; treat her as any intelligent woman should be treated, and the trouble will be over so far as help in the kitchen is concerned.

I do think there is great need of reform in this direction. How many women are toiling out their lives for want of good, reliable help, while there are many women and girls who like housework better than any other work, but will engage in teaching, sewing or any thing else rather than be one of the degraded ones.

Much of the help now to be had is worse than none at all, and why? Because we keep our best girls and women from helping us. They won't do it and I don't blame them. To this rule there are exceptions. I have known girls to rise above all this foolishness and because housework was best for them, to do it and bear the reproach. I, for one, would be strongly in favor of less pride and better help in the kitchen.

THE PRESERVING OF EGGS.

ACCORDING to a German paper linseed oil is the very best substance with which to coat eggs to render the shells impervious to air. The experiment was as follows: Ten eggs were coated with linseed oil, ten with poppy-seed oil, and ten others were left uncovered, the weights of all being ascertained. The thirty eggs were laid on sand, taking the precaution that no eggs touched one another. After from three to six months they were reweighed and opened, with the following results: The unprotected eggs had, after three months, lost eleven per cent. in weight, and after six months, eighteen per cent. On opening them they were found only half full and quite spoiled. Those covered with poppy-seed oil had lost in three months three per cent, and in six months four and one-half per cent; on opening them they were found full and without bad smell. Those covered with linseed oil had lost, after three months, two per cent, and after six months, three per cent; on being opened they were found full and smelling perfectly fresh and sweet.

Poached Eggs With Cream.

Add a tablespoonful of vinegar and a little salt to a frying-pan of hot water. Break the eggs carefully into this. Cook much or little as best liked, skim out carefully and place on buttered toast. Have a cup of milk heating in a sauce-pan, thicken with a teaspoonful only of corn starch, add a large spoonful of butter, season with salt and pour over the eggs. This is a very nice tea-dish. A. E.

Oysters now-a-days are placed in fresh water as soon as they are caught, where they are kept for a day or so to fatten. Though more plump in appearance, much of the natural sweetness of the oyster is thus destroyed.

DOMESTIC RECIPES.

Sauer Kraut.

Slice the cabbage on a "cutter." Prepare an oak barrel or keg; line the bottom and sides with cabbage leaves; put in a layer of cabbage, about four inches in depth; sprinkle lightly with salt; pound down the cabbage until compact; add another layer of cabbage and salt; repeat, pounding each layer, until the cabbage is within a few inches of the top. Cover with leaves; spread over a cloth; have a board to fit inside of the barrel and put on a heavy weight. If there be not brine enough to cover the cabbage within two days, pour over some weak brine. Examine every day as the scum rises. Lift up the cloth carefully and wash off all scum—attend to this faithfully. Keep in a warm place until fermentation ceases, which will be in from three to six weeks. Then keep in a cool, dry place.

Sweet Potatoes.

Boil until almost done, peel and bake quite brown, basting with melted butter several times.

Celery Vinegar.

Cut up into bits a large bunch of fresh celery; scald a quart of good vinegar; to it add a tablespoonful of sugar and a teaspoonful of salt. Pour over the celery. Keep in a large jar tightly corked. In two or three weeks strain into small bottles and seal or cork tightly.

Brawn.

Select a pig's head weighing six pounds. Wash and clean thoroughly (a good way is to soak in brine for 12 hours); stew with a pound of lean beef until the bones will slip out easily. Take from the liquor—their should be but little—remove the bones, chop the meat finely while hot; season with two teaspoonfuls of salt, one-half teaspoonful of black pepper, a dash of cayenne, half a teaspoonful of mace and a teaspoonful of ground cloves. Mix thoroughly and press into bowls. MARY B.

Smoky Walls.

Brush thoroughly with a broom; wash with strong pearlash water, rinsing at once with clean water. When this becomes thoroughly dry, give a thin coat of whitewash, having a liberal quantity of alum dissolved in it. When dry, finish with whiting and good size. A. M. L.

Flannel Cakes.

Make a sponge over night of a quart of new milk, two tablespoonfuls of good yeast, a little salt and flour for rather a thick batter. In the morning add a tablespoonful of melted butter and two thoroughly-beaten eggs. Bake on a griddle.

Egg-Plant.

A small egg-plant, two beaten eggs, four tablespoonfuls of bread crumbs, pepper and salt. Slice the vegetable very thin, pour over boiling water and let stand 10 minutes. Then drain, wipe dry with a towel and dip slice by slice into the beaten egg, season the bread crumbs with pepper and salt, and roll the slices in it. Fry in butter to a delicate brown on both sides. MRS. M. L.

PICKING OUT UNCURLED LEAVES.—FIG. 335.

QUESTIONS ANSWERED.

Lemon Pie.

MRS. A. S., asks for a recipe for a good meringue pie—ingredients to make but one.

ANS.—The juice and grated rind of a large lemon, a cup of white sugar, two eggs, a teaspoonful of butter, a tablespoonful of corn-starch, and a cup of boiling water. Beat well the yelks of the eggs, add the corn-starch and mix smooth. Stir this into the boiling water; add the sugar, juice, rind and butter. Let the mixture thicken; then pour into a pie-dish lined with rich paste. Bake until the crust is a delicate brown. Beat the whites (I almost always add an extra white) to a stiff froth; stir in two tablespoonfuls of powdered sugar, and spread over the top. Return to the oven till a pale brown.

Remember Hop Bitters never does harm to the smallest child, but good, always and continually.

News of the Week.

HOME NEWS.

MONDAY, Oct. 9, 1880.

THE town elections in Delaware and Connecticut seemed to give slight not gains to the Republicans. .....The mails were distributed for the first time from Chicago's new post-office, on the 6th.... ..One yellow fever case is reported to the National Board of Health, from Key West, Florida..... The Grand Jury of the United States Court, at Atlanta, Ga., has found true bills against 28 persons for armed attacks on internal revenue officers in the Second district.....The amount of foreign gold that has come to this country since July 1 last is estimated by Treasury officials to be about $35,000,000.....Three men supposed to belong to a gang of horse thieves—Dunn, Frank and Shamblin—have been implicated, by the confession of one of their numebr after arrest, in the murder and robbery of Daniel Hinkle, another of their comrades, whose dead body was recently found near Poplar, Mo. All the accused are in custody.....A private dispatch at San Francisco announces that the tourist party, with Judge Donohue, of the New York Supremo Court, while returning from the Yosemite in a six-horse coach, were capsized near Milton, California. Father Traynor had a leg broken, and his death followed its amputation. Judge Donohue and his wife and Mr. Walton sustained slight injuries. The other members of the party were not hurt.....Hon. R. G. Miller, City Collector of New Brunswick, N. J., indicted for embezzling $17,000, was arrested on the 3d and held in $10,000 bail for trial.....The National Construction Company, of New York city, is to build a mammoth iron pier, 925 feet long, at the foot of North Carolina Avenue, Atlantic City, N. J. .....The fate of some Mexican revolutionists is given in a private letter from Mazatlan, saying that ex-Governor Rubi, who was captured at the battle of San Vicente, has been shot by order of the military authorities. It is also stated in the same letter that Colonel Ramirez, the chief of the Sinaloa revolution, had entered Mazatlan in disguise, with the evident intention of taking the first steamer bound for San Francisco. His guide betrayed him, but he managed to escape to the woods about five miles from Mazatlan, where, at last accounts, he was surrounded by soldiers to prevent his escape. His capture was expected at every moment, and it is believed that when caught he will be shot.

A reduction of 10 per cent was made in the wages of the operatives of the mills of the A. & W. Sprague Manufacturing Company at Providence, R. I., now run by a trustee, on the 1st instant. On the 4th the help at Natick struck, and the mills were shut down. The operatives went to the Arctic and Quidneck, and made an unsuccessful attempt to get the operatives in those mills to strike. The trustee seems indifferent about starting up the Natick mills.....Mrs. William Clarke, of Lovilla, a suburb of Jacksonville, Fla., and her three children, were terribly burned by the explosion of a gasoline stove. The children died in a short time, and the mother is not expected to survive.....The New York Historical Society has directed its executive committee to make arrangements for the erection of a suitable memorial to Captain Nathan Hale upon the spot where he was executed by the British, September 22, 1776.. .....Mrs. Harriet A. Merrihew, convicted in Lewis county, New York, of murder in the second degree for killing David Merrihew, was sentenced to the Onondaga penitentiary for life.

The official majority in Arkansas against the repudiation amendment now foots up 3,660, and may reach 4,000.....D. C. Bailey and Callie Embanks died at Dallas, Texas, from the effects of morphine administered by mistake.....Joseph Abbott was convicted, at Elmira, N. Y., of murder in the first degree, and sentenced to be hanged November 19, for the killing of George Reed, a fellow-convict, in the Elmira Reformatory, in April last. .....Six hundred hands employed at the stove works of Rathbone, Sard & Co., at Albany, N. Y., were thrown out of work by the striking of some 237 moulders, who demanded the discharge of their foreman for refusing to pay a fine to their union, which demand the firm refused to accede to..... Mr. Burchard, Director of the Mint, says that the coinage of silver at the United Sates Mints for the last fiscal year will foot up about $28,000,000. Adding to that the net exports of silver bullion and probable consumption in the arts, etc., the production of silver for the year will be about $35,000,000.....Two of the most valuable buildings, comprising the extensive works of Holmes, Booth & Hayden, at Waterbury, Conn., containing many costly machines and tools, were destroyed by fire on the 5th. The loss will exceed $200,000, and the business of the company will be greatly crippled The works are well insured.

New glass works have been started at Rochester, Beaver county, Pa., with a capital stock of $20,000..... Diphtheria is prevailing to an alarming extent in Johnstown, Pa.....The boilers in Pitt & Cravage's mills at Bay City, Mich., exploded on the 2nd, killing George Parker.....

The New York, as well as the Chicago dry goods houses, are increasing their sales to the West this year 100 per cent. over those of last, and to the South fully 200 per cent. Some of the houses in New York have orders that cannot be filled for two months. The large establishments are working relays of clerks day and night. Some of the imports of silk and satin goods are of the richest and most costly description. Some of them are of all shades of blue and pink, and embroidered in pure gold and silver. One house in New York has just imported the third lot of such goods: and, to give an idea of how women will dress this year, suffice it to say that this line sells for $35 to $45 a yard, and that it takes about fourteen yards for a complete costume.....J. O. Wright, cashier in the office of the late Sheriff of New Orleans, has been arrested for embezzlement..... William Style, of Claremount County, O., was robbed of $3,500 in gold on the 4th, by a substitution of valises.....One Nolan has been found guilty of murder at Castroville, Texas, and sentenced to ten years of imprisonment..... .....The writing paper mill at Elkhart, Ind., owned by J. R. Beardsley, John Cook and Mrs. Benjamin F. Davenport, was burned on the 5th. Loss, $38,000 insured for $16,000.....W. H. Fairchild, recently arrested at Chicago on the charge of having murdered Richard French, the step-father of his wife, in Harper county, Kansas, in 1878, has confessed his guilt.....The report of the local steamboat inspectors at Detroit, in regard to the burning of the Marine City on Lake Huron in August last, blames all the officers of the steamer, whose licenses have accordingly been suspended.....

Dick Allen who has just arrived at Denver from the South, reports that warrants were issued for the arrest of Agent Berry, Captain Kline and Hoyt on the charge of murdering young Jackson, the freighter, whom they turned over to the Uncompahgre Indians, add that officers have gone to the Los Pinos reservation to make the arrests. He further states that the citizens and freighters are thoroughly aroused, and should the men be taken they will likely be lynched before they can be conveyed to Gunnison City.....The safe in the office of the Western Hotel at St. Louis was robbed on the 6th, of money, watches and other articles valued at between $3,000 and $4,000. John Slater, night porter, who has served a term in the penitentiary, is supposed to be the thief, as he is misssing.....Camp & Walker's extensive steam saw-mill, located near Suspension Bridge, Minneapolis, Minn., was destroyed by fire on the 6th. Loss, $76,000; insurance, $17,500.....Thomas Forrest, who fatally stabbed Michael Corbis, for discharging him from employment at the California Mine, Silver Reef, Utah, was taken from jail on the 5th by masked men and hanged.

The Post Office Department has issued an order stopping the delivery of registered letters and postal money orders addressed to R. J. Kozboth, of 48 Broad street, New York city, who it is alleged is engaged in conducting fraudulent stock operations, doing business under his own name and the aliases of "The Mutual Stock Company, Nos. 1 and 2.".....Henry Bijot, the Frenchman who killed Harriet Renaut, a respectable married woman, at New York, in August last, because she refused to run away and marry him, was committed for the Grand Jury, having been in the hospital in consequence of an attempt at self-destruction. He claims the woman had her throat cut in attempting to wrest a razor from him.....In the suit of James A. Whalen against General Phil. Sheridan, to recover the value of certain personal property in Mississippi, of which he was dispossessed by the general while in command of the Department of the Gulf, in 1865, Judge Blatchford, of the United States Circuit Court of New York, handed down his decision, denying the motion of plaintiff to file a bill of exceptions, and with leave to make application to the Supreme Court, to which plaintiff has taken out a writ of error. The bill of exceptions should have been filed before the entry of judgment, and the Court is not satisfied that the case for relief is made out.

A terrible railroad accident occurred at Pittsburg, Pa., late Saturday night Oct. 9th, when one section of an excursion train out of Pittsburg ran into another which had been stopped on the track near the city. So great was the force that the locomotive plowed its way nearly to the middle of the rear car, splitting it wide open. Those on the rear platform, seeing the danger, leaped off and escaped. To make it still more horrible, one of the locomotive's cylinders was broken, allowing clouds of scalding steam to envelop the wounded and those who were unable to get out of the way. Twenty-five were killed and some fifty others wounded, some of them dangerously.

FOREIGN.

THE "Eastern Question" is still the most prominent in European politics. It was hoped that the Sultan would surrender Dulcigno to the Montenegrins, as he had asked the Powers to delay until Monday the threatened demonstration of the combined fleet. Having besought in vain the German Emperor to interfere in his behalf, last Tuesday he refused to yield. He promises, however, that if the fleet withdraws, he will endeavor to persuade the Albanians to surrender the town, and as regards Greece, he will surrender a strip of territory a great deal smaller than she demands, and considerably less than was agreed upon at the Berlin Conference. Moreover, he engages to begin the promised reforms in Asia Minor within three months, and that reforms in European Turkey shall be carried out as far as compatible with the integrity of the empire. If the naval demonstration is made, however, he declares that he would abdicate rather than make any concession. As the Porte has always been liberal of promises, and niggardly in performance, the Powers have decided not to permit themselves to be "fooled" again. England and Russia are the most determined to exact compliance with the requirements of the Berlin Conference, while France and Austria hesitate to have recourse to force. Germany and Italy are ready to indorse any action that may be mutually agreed upon. As neither Austria nor France would consent that their portion of the combined fleet should engage in any absolutely hostile movement, it has been decided that the vessels of three of the Powers—probably England, Russia and Italy—should be ordered to carry out the coercive measures which have been agreed upon.

Vice-Admiral Seymour, commander of the British contingent, who has also been entrusted with the command of the combined fleet, has already issued orders to the Russian commander to prepare for action. It was first contemplated to blockade Constantinople, and afterwards it was proposed to blockade Smyrna and a couple of other ports in Asia Minor; but these projects have, for the present, been abandoned, and it is now probable that some of the Turkish islands in the Grecian Archipelago will be seized upon. Fifty tons of ammunition and a large number of cannon and gatling guns have already left Portsmouth for the Mediterranean, and before our next issue it is probable that war will substantially have been begun against the Turks. The Montenegrins have all the men they can spare from harvest under arms ready to attack Dulcigno, if sure of support from the Powers. They ask money from the latter, however, to enable them to keep so large a force in the field, as they are themselves poor. The Albanians have withdrawn a short distance from Dulcigno, but are ready to return should the Montenegrins attack the place. Riza Pasha, commander of the Turkish troops in the neighborhood, who some weeks ago drew off, to allow the Montenegrins and Albanians "to fight it out," instead of surrendering the town as the Powers insisted should be done, still stands aside with his forces awaiting events. The Albanians, it is said, are liberally supplied with arms by the Turks, and a number of Ottoman troops have been disbanded in the neighborhood with the express purpose, it is alleged, that they should join the Albanians as volunteers. This morning's cablegrams intimate that Germany and Austria are still decidedly reluctant to resort to war measures in order to coerce the Porte to make the desired concessions. Great Britain and Russia alone are determined at all hazards to force compliance with the terms of the Berlin Conference. It may be that the agreement that has hitherto existed among the Powers, will be disturbed before action is taken, and it is upon such a contingency that the Turks mainly rely to carry their point.

In Ireland the Land-leaguers, who insist that those who till the soil should own it; the Home-Rulers who declare that the "Gem of the Sea" must have a Parliament of its own at College Green instead of a paltry representation at Westminister, and the Fenians who proclaim that Erin shall be entirely independent of the hated Sassanach, have combined, and are directing their chief efforts at present to the land question. Monstrous mass meetings are still being held in different parts of the island. To these the peasantry flock from all the surrounding country and many of them are attended by masses of men from distant points, marching in serried ranks to show that in case of necessity a large part of the population is organized, drilled, and ready to support by force the measures they demand. While the harrangues at each meeting are of a highly inflammatory nature, great care is generally taken to remain within the letter of the law, however far its spirit is exceeded. The occasional murders and frequent destruction of property that are, in a great measure, caused by the violent passions aroused by the language used at such assemblages, are often excused on the ground that they are the natural results of ages of cruel oppression. Rents are still refused in some sections unless when collected by the machinery of the law, and it is proposed to inaugurate a national strike against paying a farthing to rack-renting landlords. Orangemen are urged to be ready for action against their Catholic countrymen in the event of trouble. Mr. Foster, Secretary for Ireland, has just intimated that the Government is likely soon to suspend the right of *habeas corpus*. The agitation seems thoroughly well organized, and well under control of its leaders who appear determined, for the present at any rate, to keep within the law. Indeed it is likely that high legal advice is taken as to how far they can go without incurring legal penalties.

In France, yesterday's cablegrams announce that it has been determined at last to take vigorous action against the religious orders, and it is said that next week many of them will be expelled just as the Jesuits have already been. This is sure to arouse the bitter opposition of the religious folks against the government; but Gambetta and the radicals demand the measure, believing that the clericals are hostile to the Republic anyhow. A strong party is opposed to any coercion of the Turks by force of arms, as they wish to keep clear of all political entanglements, doubtless to be ready to take advantage of any opportunity that may arise for getting an advantage over Germany. Bismarck has declared, however, that Germany will not be a party to any hostile measure, unless all the Powers combine in it. The difficulty has been avoided, however, by appointing three of the Powers to carry out the orders of the whole, as the French and German contingent to the fleet need then take no part in the movement.

AGRICULTURAL NEWS.

THE Dixie Agricultural and Mechanical Association will have its annual meeting at Wadesboro, N. C., on the 26, 27, 28 and 29 of October.... ....The three countios of Dane, Rock and Jefferson, Wis., raise nearly all the tobacco in that State, and the little village of Edgarton, on the line of the St. Paul railroad, is the center of the trade. This year the crop is said to be one of the largest ever raised, and the prospect is now that it will command the highest price. Buyers are already in the field offering to make contracts at eight and a half cents. Some idea of the profit of tobacco culture may be formed when it is known that a good yield per acre is about 1,600 pounds, which at the current price to-day, would bring the farmer $128. The crop is also more certain than wheat, and less liable to attacks from enemies that destroy it. It is estimated that over $10,000,000 will be paid for tobacco this year in Wisconsin. .....On the 4th inst. great numbers of large, white butterflies appeared in the township of Lackawaxen, Pa., much to the alarm of farmers, who feared another insect visitation. So dense was the mass in some places that it looked like a snow storm.....The yield of champagne this year will be one of the smallest, but also one of best for many years.....In a ballon ascension from Montreal, Canada, Sept, 24, the aeronauts, at the hight of 8,400 feet, were met by a shower of thistle seeds falling toward the earth.

The epizooty has almost entirely disappeared from this city and neighborhood. It was of a very mild type, and caused little fatality though nearly half the horses hereabouts were more or less affected by it. In a stable we know of three old horses that were affected by the epizooty some eight years ago, escaped this year, though four younger animals in the same stable were attacked. The advice given editorially on the matter last week is the best that experience here has hitherto taught. The ailment has already spread south as far as Washington and west beyond Cincinnati and nearly as far as Chicago, by latest telegrams. There is little doubt but that its ultimate range will be as extensive as the epizooty that caused so much inconvenience and loss nearly a decade ago. This appears to be of the same kind; some say precisely the same in nature, but of a milder type.

"And the Leaves Were for the Healing of the Nations."

This is fully exemplified in the demonstration that so common a pasture weed as smart-weed, or water-pepper, possesses medicinal properties when combined with essence of Jamaica Ginger and other efficacious vegetable extracts, as in Dr. Pierce's Compound Extract of Smart-Weed. It constitutes a most potent remedy for bowel affections as diarrhœa, dysentery, flux, etc. It is also an efficacious medicine for colds, and to break up fevers and inflammatory attacks, and for the alleviation of pain. Every family should keep a supply of it. 50 cents by druggists.

Goldsmith's "Vicar of Wakefield," complete, for 6 cents, is one of the Revolution pamphlets that have lately been selling by the hundred thousand. People have thought it amazingly cheap, but you get the same thing handsomely and strongly bound for 8 cents, in the Acme Library of Modern Classics, which contains that and four other famous classics for 40 cents. American Book Exchange Publishers, New York.

Volumes II. III. and IV. of the "Library of Universal Knowledge," large-type edition, are now on the presses, all printing at the same time. This is the busy season of the year for publishers generally, and printers commonly are pressed to the utmost, so that we have found it nearly impossible to get presses enough to meet our needs. We are now taking the resources of eleven large printhouses, and are rapidly gaining on our delayed work. Vol. II. will be ready about Oct. 11, vol. III. Oct. 15, and vol. IV. Oct. 20. American Book Exchange, New York.

We are strongly disposed to regard that person as the best physician who does most to alleviate human suffering. Judged from this standard, MRS. LYDIA E. PINKHAM, 233 Western Avenue, Lynn, Mass., is entitled to the front rank, for her VEGETABLE COMPOUND is daily working wonderful cures in female diseases. Send for circular to the above address.

For Thirty Years

I have been afflicted with kidney complaints. Two packages of Kidney-Wort have done me more good than all the medicine and doctors I have had before. I believe it is a sure cure. So writes an old lady from Oregon.—Salt Lake City Tribune.

Quiet nerves and Balmy Sleep in Hop Bitters, for sleepless Ladies and Invalids.

Burnett's Cologne is of the best quality, and is filled in elegant bottles of superior finish and beauty. It is offered in POPULAR sizes and at POPULAR prices. This refreshing perfume is thus brought within the reach of every one. It is prepared from the purest and best materials, and with the utmost care.

In Quarter and Half Pints, Pints, and Quarts. In Basket style, cork and glass stoppers.

The Markets.

SPECIALS FROM THE CHIEF CENTERS.

Until Saturday, Oct. 9.

All sorts of grain, especially wheat, has had an upward tendency during the week.

BOSTON.—BUTTER.—The market is a cent a pound less than last week on the fine grades. Western ladle packed, unless freshly made, is neglected, and western dairies sell slowly. The bulk of the receipts from New York and Vermont consists of long dairies. Northern—Choice creamery, ₱ lb, 30@32c; choice New York, 27@28c; choice Vermont, 28@30c; long dairies, 25@25c; common, 17@19c. Western—Choice creameries, ₱ lb, 29@32c; fair to good, 27@28c; dairy-packed, 20@25c; choice ladle-packed, 20@22c; common, 17@20c. CHEESE.—Good cheese sells at 12@12½c; and there is nothing less than fine offering. Fine factory, New York and Vermont, ₱ lb, 13½@13½c; fine factory, Ohio and West, 12½@13c; fair to good, 11@12c; skims, 7@8c. POTATOES.—Northern whites 43@45c, and Rose from 50@53c, with the best Houlton stock at 53@55c. Sweet potatoes are plenty at $1.50@$1.75 per bbl for Norfolk stock. ONIONS steady at $2.75@$3 for red, and $3.25 for yellow. APPLES.—Choice at $1@1.25, fancy eating $1.50@1.75, and common fruit at 50@75c ₱ bbl. There is no demand for cranberries, and the market is dull at $4@$5 ₱ bbl. GRAPES.—Isabellas at 4@5c, and Catawbas at 6@7c ₱ lb. QUINCES are dull at $3 per bbl for New York. TOMATOES are pretty nearly through for the season, and job at 35@50c per bushel box. WOOL.—Buyers operating cautiously, and holders not disposed to ease off in the least. Combing and Delaine Fleeces continue in demand, and in unwashed and unmerchantable Fleeces a fair business is doing. Transactions in California wool moderate. Pulled wools in steady demand at current rates. No change in foreign wool. Sales include Ohio and Pennsylvania and West Virginia X, XX, and XXX at 44½@47c; Michigan X and No. 1 at 30½@45c; Wisconsin X and fine No. 1, 40@43c; Combing and Delaine at 44@52c; Kentucky combing at 36c; Georgia at 36c; Missouri at 33½c; Texas at 19@30c; Territory at 18@37c; Unwashed and unmerchantable at 18@40c; Spring California at 23½@33c; Fall California at 19c; Super and X Pulled at 40@50c; Scoured at 46@52c.

Chicago.—WHEAT excited, active and firm, No. 2 Red Winter, $1; No. 2 Chicago Spring, 97¾c., cash; 98¾c. November; 99¾c. December; sales at 97¾c@99¼c. November; No. 3 do., 92¾c; Rejected, 75c@79c. CORN active and firm at 39⅝. bid cash; 40¾c. bid November; 41@41¼c. December; sales at 40⅛@40¾c. December. Rejected, 38¾c. Oats active and firm at 30¼c. cash and November; 34¾c. May. RYE firm at 83c. FLAX-SEED, $1.25 PORK steady at $18 cash; $18.25. October; $12 55@12 60, November, $12 20 bid, all the year; $12 90 bid January. LARD strong and higher at $8 32½@8 35, cash; $8 17½@8 20. November; $8 12½@8 15, all the year and January. BULK MEATS moderately active and higher. BUTTER.—The demand continues active on local, shipping, and export account, with prices firm and unchanged. We again quote: Choice to fancy creamery 29@30c. per lb; fair to good 25@28c; fine to fancy dairy 23@25c; good, do, 19@21c; medium to fair do in shipping lots 16@17c; choice ladle-packed 17@20c; fair to good packing stock 15@16c; grease butter 8@10c. CHEESE. Fair to choice makes continue in active request at firm rates. We again quote good to fine cheddar creams at 12½@13c. per pound and do flats at 12@12½c. while the poorer goods were going all the way from 10c to 12c., or as to condition and amount of injury. CIDER.—The supply of newly-made is liberal, and the demand is only moderate. We quote strictly fresh juice at $4 per bbl. SEEDS Timothy and flax were active and strong with other kinds slow. Clover was dull at $4.50@4.75 per bushel for good to choice medium, with mammoth going at about 25c. better. Timothy was quotable at $2 20@2 25 for poor and foul to fair, and $2.37½@2 37½ for good to fully prime, and $2 33@2 35 for extra bright samples; nothing was doing for futures. Flax was in quite good request at $1 22½@1 23 for good, on a basis of pure, to better for fine and desirable sorts. Hungarian and millet were about 60c for good, for cash or future delivery. WOOL.—The asking rates from store for eastern Iowa, Wisconsin, and Illinois wool ranged as follows: Tub-washed, bright 46@48c per pound; do. dingy and coarse 41@43c; fleece-washed medium 40@42c; do fine 36@38c. do coarse 33@35c; unwashed medium 28@32c. do coarse 20@23c; do fine bright 25@26c; do heavy 18@21c. bucks' fleece 16@18c. Consignments from western Iowa, Nebraska and Kansas sell about 2c. per lb less than this range, and burry and poor conditioned lots at 3@5c less. Colorado wool (unassorted) is quoted at 25@28c per pound for medium to fine; 19@25c for coarse to medium, and black at 21@23.

St. Louis.—WHEAT excited and higher; No. 2 Red Fall, 99¼c@$1.00¼, cash; 99⅞c@$1.00¼, October; $1@$1.02 1-8, November; $1.02@$1.04, December; $1.04, January; $1, all the year; No. 3. do., 75@96c; No. 4 do., 91c. CORN higher at 39@39¼c. cash; 39¼c, October; 39¼@39¾c, November; 38½@39c, December; 38¼c@38 7-8c, all the year; 44 1-8@44¼c. May. OATS higher, but second at 29¼c, bid cash and October; 30½c, November; 31¼c bid December. RYE quiet at 83¼c. PORK quiet; jobbing at $15.85@$16. LARD, $8.50, bid. BULK MEATS firm and higher; car lots of 30-day meat—Shoulders, $5; Clear Rib, $8; Clear Sides, 8¼c. BACON firmer; Shoulders, 5¼c; Clear Rib, 8¾c; clear sides, 9c. BUTTER—Creamery mainly at 30c; selected dairy 26c; prime to choice do. at 20c to 24c; low 13@15c; country at 10@12½c for poor, to 15@17c for sweet yellow. HOGS firm; Yorkers and Baltimores, $4-$4.70; mixed packing, $4.50@$4.70; butchers' to fancy, $4.80@$5.10. CATTLE in fair demand; supply light; grass Texans and mixed butchers' stuff weak at $2@$3. SHEEP steady at $3@$3.75.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 9, 1880.

BEANS AND PEAS.—Small samples of new beans quoted: Marrow $1.75; medium, $1.55; pea, $1.70@1.75; red kidney $1.65. An easy feeling prevails but no large home or export parcels of beans are in treaty. Green peas quiet at $1.50@1.55; Southern B. E. off to $1.75 per 2-bu. bag.

Marrow beans, prime, $1 60@1.62½; other, $1.50@1.55; mediums, prime, $1.45@1.47; other $1.35@1.40; pea, $1.55@1.60; white kidney, $1.65@1.75; red kidney, prime, $1.40@1.45; other, $1.30@1.37½.

BUTTER.—As was feared by many in the trade, strong starting quotations for the Fall have proved interruptive to general business. Present indications are that there must be considerable unbending before the trade puts on a wholesale pace or else there will be an uncomfortable accumulation of State stock that is easily condemned in a dull market. Sellers of Western have begun to mark down all grades, and this calls off a certain class from under grade, and even good State. Very good full dairies are included in the receipts, but there are few bids for valuable linen. As a rule dealers have ceased cutting off fine ends of dairies. Sometimes a customer can be made by the concession breaking into fresh, fine ends, but if the practice is prolonged it is ruinous for average quality. Foreign buyers are not a power in supporting prices, and their absence tends to make sellers solicitous as to the future and the outlook is that the the local or retailing trade, which loudly deplores a diminished demand, will soon have to be met. The most marked decline for the week is in creamery. A portion of the exports are thought to be butter substitutes.

Creamery, fine State, 30c.; Western, 28@29c.; good to prime, 26@28c.; fair to good, 23@26c.; poor to fair, 24@26c.; sweet cream, 25@28c.; State firkins, 22@24c.; entire dairies, choice, 25@25½c.; other, 23@24½c.; pails and half tubs, choice 27@27½c.; good to prime, 25@26c.; poor to fair, 24@24c.; Welsh tubs, choice, 25@27c.; other, 20@24c.; Western imitation creamery, 20@23c.; dairy, fresh, 23@23c.; fair and other, 18@22c.; factory, fine June, 18@19c.; present make, 18@19c.; medium, @17c.; poor, 15@16c.

Receipts for week, 34,100 pkgs.; exports do., 11,555 pkgs.

COTTON.—Has been more active and closed firm. Latest prices are for

October, 11.02; November, 11 01; December, 10.86@10.89c.; January, 11.02@11.03c.; February, 11.17@11.18c.; March, 11.33@11.31c; April, 11.49@11.50c.; May, 11.64@11.66c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Receipts for week, 30,479. Exports do. 15,551.

CHEESE.—There has been a slow market until towards the close when with concessions more trade resulted on export account, with the shipments for the week, 42,600 boxes. The latest prices are for

State factory, fancy, at 12¾@13c.; do. good and prime, 12¼@12¾c.; do. fair to good, 11¼@12¼c.; do. h'f skimmed, 10@11c.; Wisconsin factory, fine, 12¼@12¾c.; do. good to prime, 12@12¼c.; do. fair to good, 10¾@12c.; Ohio factory, fine, 12¼@12¾c.; do. good to prime, 11¾@12c.; do. flat, fair to good, 10¾@11¾c.; do. poor to fair, 7@10c.

Receipts for week, 63,018 boxes.

Liverpool cable, 65s.

Steam to Gt. Britain, 35@45s.

HONEY.—Some parcels have gone into the hands of retailers, but the market is not active compared with the heavy supply.

White clover comb, single pkgs. 17@18c.; larger pkgs 15@16c.; buckwheat 12@13c.; extracted white, 10@12c.; dark, 8@9c.

DRIED FRUITS—Show little of interest. Trading is mostly in small lots, and prices varying slightly only. Quotations are for:

Apples—Old, State, at 5@6c., new, Tennessee at 3½@4c.; new Virginia at 4@5c.; fancy sliced North Carolina at 6@7c.; evaporated, ring cut, at 8¼@9¼c. Old peeled peaches at 8@14c. Blackberries at 8c.; Raspberries at 25@26c. Pitted cherries at 19@20c. Whortleberries at 11c. New Georgia peeled peaches at 16@17c.; new North Carolina peeled peaches at 18@20c.; new unpeeled peaches, quarters at 7@7½c.; new unpeeled peaches, halves at 7¼@8c.

Receipts for week, 1,591 pkgs.

Exports for week, 1,022 bbls. of dried apples.

EGGS.—Receipts for the week, 8,200 pkgs.; do last week, 6,856 do. Supplies continue light for general wants and good Fall prices are ruling. Near points are hardly quotable. Limed eggs quoted at 18c. for fine State.

N. J. and near by, per dozen, 25c.; State and Pa. 23@24c.; Western, fresh, 22@22½c.; Canadian, 22@22½c.; second or held, 21@21½c.

FLOUR.—There is an active export and home trade and prices advancing.

Latest sales are at: $3.40@4.10, for very inferior to very fancy superfine State and Western; $4.00@4.25 for poor to choice extra State and Western, odd lots and lines; $4.25@4.35 for choice to fancy do.; very inferior to good white wheat, trade and family extras, $4.75@5.15; good to choice do, at $5.05@5.10; (very choice to fancy do. at $5.25@5.50;) red and amber winter wheat inferior to choice trade and family, at $4.50@5.00; round hoop Ohio, $4.45@4.40; and trade and family brands of do. at $4.20@5.00; St. Louis at $4.75@5.00 for inferior to good extra; $5.00@5.10 for good to choice (and $5.10@5.50 for choice to fancy brands); Minnesota clear, inferior to fancy at $4.00@5.50; Minnesota "straight," poor to fancy, at $5 75@7.25, and patent inferior to very fancy at $5.75@8.75; unsound stock at from $2.50@5.00; city mill extra at $5.20@5.40 for fair to very choice for the West Indies; do. for England, $4.90@4.35 for poor to choice spring wheat, and $4.50@5.25 for winter wheat product; do. trade and family extras, $5.40@6.75; do. for South America, $5.40@5.75.; No. 2 at $2.50@3.50 for very poor to very fancy.

Receipts for week, flour, bbls. 102,000; corn meal, do. 1,500; wheat, bush. 1,585,750; corn, do. 1,600,650; oats do. 423,400; rye, do. 58,600; malt, do. 56,150; barley, do. 171,800; beans, do., 6,300; rice, pkgs. 1,175.

Exports for the week, flour, bbls., 75,650; corn meal, do. 3,600; wheat, bush. 1,547,500; corn, do. 515,575; oats, do. 2,677; peas, do. 2,750; beans, do. 1,207; rice, 850.

CORN MEAL.—Sales at $2.60@2.75 for yellow Western, $3.25@3.30 for Brandywine.

FRESH FRUITS.—Exports of apples for week, 36,500 bbls. The market is still largely supplied with apples and with better receipts qualities favor buyers. Exporters continue to buy heavily, but the total is perhaps swelled by stock going on owners' account. Pears are thinning down. Virgilieus, which used lead the trade in old times, have to give to place to hardier, better-keeping stock. Seckles are scarce; there have been none too many this Summer. Duchess are plenty and very cheap for so useful a table pear. Cranberries are stocking up; demand quite limited. Grapes active, fine quality assisting sales. Peanuts weak, they have to divide the trade with new Fall sorts. Chestnuts and hickory bring fair prices.

APPLES.—Western N. Y., mixed, Fall pippins, and 20-oz., $1@1.25 ₱ bbl.; Baldwins in shipping order, $1.25@1.37; Greenings, 75c @$1. Kings, $1.2@1.37; open heads and common, 50@75c. Cranberries, Cape Cod, fancy, $6; other, $3@5.50; do. boxes, $1.75; N. J. boxes, $1@1.50. Quinces, common to fair, $2@3; good to extra, $4@5. Fancy Boston pears, $3@6 per bush. box; Duchess, ₱ bbl., $3@5; Louise Bon, $3@5; Virgalieu, 3@6; Sheldon, $3@5; cooking, $2@3. Delaware grapes, cases 18 3-lb boxes, $3@4; in baskets ₱ lb 6@8c.; Catawba cases, 18 3-lb boxes, $2.25@2.75; in baskets, 3½@4½c.; Concords, in cases, $1.50@2; bulk and baskets, 2½@4c.; Isabella 2½@3c. Peanuts, Va. hand-picked, 5¾c.; good to extra prime, 4@4¼c.; shelled, 5½@5¾c. Chestnuts, $2@3 ₱ bush. of 60 lbs. Hickory nuts, $2@2.25 per bush. of 50 lbs. Florida sends some very handsome lemons which command $3.50@4 ₱ box. Oranges are not in quotable stock; it is early for a demand. Those arriving are merely drops.

GRAIN.—Wheat has an active, export and speculative demand and prices higher

The latest sales are of No. 1 white at $1.11¾@1.14; do. October, at $1.11¾@1.13; do. November at $1.11¾@1.12¾; do. December $1.13@1.13¾; ungraded white at $1.03@1.14; mixed winter at $1.10@1.10¾; No. 1 red at 1.16¾@1.17; No. 2 red at $1.11¾@1.14; do. October, at 1.11¾@1.13¾; do. November, at $1.11¾@1.13¾; December, at $1.13@1.15; do. January, at $1.14@1.14¾; No. 3 red at $1.10@1.11; ungraded red at $1.04¾@1.14¾; No. 2 Milwaukee spring, choice, at $1.12; No. 2 Chicago at $1.03¾@1.03. Rye at 87@88¾c. Corn is active and higher latest sales are of New York No. 2, at 53¾@53¾c.; do., October, at 52¾@53¾c.; do., November, at 53¾@53½c.; do., December at 54¾@54¾c; ungraded mixed Western at 53¾@53¾c.; new crop yellow Southern, a small lot, poor quality, at 48c. Oats are more freely offered and prices easy; latest sales are of No. 1 white at 41c.; New York No. 2 white at 40@40¾c.; do. No. 3 white 38c. October 38¾@39c. do. December at 39¾@39¾c. No. 3 at 38c.; ungraded white Western at 40@40c., ungraded mixed Western at 38¾@41c.; mixed State at 41¾c.; No. 2 Chicago 40c.

HOPS.—The arrivals are larger and prices unsettled and weak. Quotations are for

	Cents per lb.
New Yorks, crop 1880, prime and choice	23 @26
Do. medium	21 @23
New Yorks, crop 1880, low to fair	18 @21
Eastern, crop 1880	20 @24
Wisconsin, crop 1880	20 @24
Yearlings, crop 1879, choice	20 @25
Olds, all growths	4 @14

LEATHER.—Quotations are for hemlock sole 23@24; 24@26 for middle; 24@26 for heavy, and 21½@33 for good damaged do.

HAY AND STRAW.—Demand is liberal and prices strong.

Shipping hay quoted at 80c.; medium to prime do., 90c.@$1.15; salt hay at 60@65c.; clover do. at 65@75c. Straw at 95c@$1 for long rye; 70@75c. for short rye; and 65@75c. for oat.

POULTRY AND GAME.—Dressed turkeys exceed the want of trade and prices are very easy; few reach 14c. Fowls and chickens have a fair demand, as good stock can be had at inside figures. Ducks are doing well; geese begin to sell. It is thought that eastern ducks will be plenty enough this season for a New York quotation.

Turkeys, choice, 11@12c., ₱ lb.; fair to good, 10@11c; Phila., dry-picked, 13@14c. Chickens, do., 15@16c.; Bucks Co. do. 13@14c.; State scalded, 12¾@13c.; Western, scalded, 11¾@12¾c. Fowls, Phila., dry-picked, 13¾@14¾c.; N. J., d. p., 12@13c.; scalded 12@13c.; State, scalded, 11@12c; Western, scalded, 11@12c.; poor, 9@10c. Ducks, Spring d.-p., 16@18c.; mixed, 12@14c. Geese, Phila. Spring 13@14c.; fair, 9@10c. Squabs, white, ₱ doz., $2.25@2.37; dark, $1@1.25.

Live poultry is in rather light supply, but prices are only fair, as deliveries of dressed are free.

Chickens, New Jersey, per lb 12@13c.; State, 11@12c; Western, 11c.; Southern, 10@11c. Fowls, New Jersey, 11@12c.; Western, 11@11¾c.; Southern, 11c. Roosters, 5@6c. Turkeys, young, 10@11c.; old, 9@11c. Ducks, choice, 60@75c.; other, 40@55c. Geese, choice, $1.75; other, $1@1.50.

There is an easy tone to prices throughout the game market. Trade is somewhat brisker as sellers can exhibit more stock and do not depend upon the ice-box as much as formerly. A good many bear have arrived, mostly, however, in a spoiled condition.

Mallard ducks, 50@60c.; teal, 35@40c.; common 25@30c.; a few red heads and canvas backs have sold at $1@2 respectively. Partridge, prime, 90c.@$1 00; eastern, 50@60c.; soft, 35@25c.; grouse, dry, 75@85c. wet, 50@60c.; woodcock, State, 75@85c.; Western, 50@60c.; Eng. snipe, ₱ doz., 40@50c. Sand snipe, 40@50c.; plover, $1.50@1.75; wild pigeons, flight $1.25; Minn. short saddle, venison 16@20c.; other short saddle, 14@16c. whole deer, 10@12c.

PROVISIONS.—In hog products lard has been unusually active on export account, and prices advancing other articles have been dull.

Mess pork at $16, for spot lots. Bacon at 8-¼c. for long clear, and 8¾c. for short clear. Lard—Western steam at 8.80 for spot lots; 8.72½c. for Oct; 8.60 for Nov., 8.45c. for Dec. and Jan. deliveries. Stearine at 9c. for choice. Tallow at 6¼@6 5-16c. for prime. Beef hams at $15.50. Beef at for extra India mess $19@20 for city; $9.50@10 for extra mess and $9.00 for plain mess $11@11.75. for packet, and $13@13.25 for family mess.

Receipts for week, beef, 450 pkgs.; pork, 1,575 bbls.; cut meats, 20,850 pkgs.; lard, 23,120 pkgs.

Exports for week, beef, 1,750 bbls.; pork, 4,798 bbls.; cutmeats, 5,619,902 lbs.; lard, 5,921,075 lbs.

SEED.—Clover is in moderate demand and steady, quoted at 8¾@9c. Timothy is quiet at $2.70@2.80, Flaxseed quoted at $1.40.

Receipts for week, 2,256 bushels.

Exports for week, 650 bags.

TOBACCO.—There is a brisk demand for Kentucky leaf, with prices generally steady.

VEGETABLES.—Exports of potatoes for week, 10,900 bbls. Potatoes are firmer and steadier with an improved export demand using up considerable stock. Nova Scotia E. Rose, $1.75@1.87. State, $1.25 $1.50; snowflake, $1.37@1.62; peerless, $1.12@1.25. Sweet potatoes have ruled low, but at the close there is a prospect of recovery. Garden stuff begins to favor sellers, as the frost in some cases has sent down supplies. Lima beans have advanced.

Sweet potatoes, Va., $1.25@1.50; extra, $2@2 50; Green corn, ₱ 100, 50@75c.; tomatoes, ₱ bush., 20@25c.; egg plants, per bbl., $3@4; Lima beans, per bag, 2.00@$2.50; shelled, per bush. $3.50@4.00; turnips, ₱ bbl 50c; Russia turnips ₱ bbl. 50c.; bullnose peppers, ₱ bag, @$1.50; cabbage, flat Dutch, ₱ 100, $2@$3.50; do. red, $3@4.50; marrow squash, ₱ bbl. 40@50c.; Hubbard do., 75c.; onions, white, $3.50@4; yellow, $2.50@$3.75; red, $2.50; chester, $2 25@$2.40; carrots, ₱ 100 bunches, $2.00; pumpkins, ₱ 100 $2@4; okra, 25c.; cauliflower, ₱ bbl. $1@1.50; celery, per dozen, 75c.@$1.00; beets, 100 bunches, $1.

WOOL.—Trade has been slack again this week, manufacturers buying only to replenish assortments. Prices generally have been held very steady. Quotations are for

Ohio, Penn., and W. Va. XXX 46@48c.; XX, 43@45c.; X, 43@45c.; No. 1 40@48c.; No. 2 42@44c.; coarse, 35@38c.; combing 43@48c.

N. Y., Mich. and Wis. XX 38@41c.; X 38@40c.; No. 1 44@47c.; No. 2 38@42c.; coarse 33@35c.; combing 43@46c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Oct. 9, 1880.

BEEVES.—Receipts for the week 12,415 head; do. last week, 14,817 do. For the closing day there was some interruption to receipts at 60th street owing to a delayed train. The Jersey yards however, were full enough to supply all wants. The market was quite as strong as on Wednesday, and in some cases a shade better, more particularly in good low priced wholesaleing stock. Texans quoted 6¾@8¾. Colorado, 6¾@7¾c. Grass cattle generally quoted 7¾@8c to dress, 54@55 lbs.; poor to fair corn fed steers, 8¾@8¾c to dress 56 lbs; good to choice, 9¾@10¾c to dress 56@57 lbs.

COWS AND CALVES.—There is no quotable change; the range is $30@55 for common useful to prime milkers, for private use some singles bring $60.

VEAL CALVES.—With fair receipts of live and dead the market holds very good rates. Outside figures were obtained only in a small way.

Live calves, N. J., fed, 7¼@7¾c., State choice, 6¾@7¼c.; good, 6@6¾c.; poor, 4¾@5¾c.; Mt. Holly, large, 5c.; light and medium, 6@7c.; buttermilk, 3@3½c.; grassers, 2@2½c.; fair to prime hog dressed, 10@10¾c.; common to fair, 7½@9¾c.; dressed buttermilk, 5@6c.; do grass, 3½@4c.

SHEEP AND LAMBS.—Receipts for week, 23,316 head; do last week, 39,535 do. Sales slow and many head left over. Poor to prime sheep 3½@5c. Lambs 4½@6½c. A few selected wethers for export made 5½@5¾c.

SWINE.—Receipts for the week, 31,675 head; do. last week, 27,529 do. Market quoted steady at 5½@5¾c, the latter a holding sale for two carloads of fine Ohio. City dressed and State, 6¾@8c.; do. Western, 6¾@7c. Country dressed pork, light, 8@8¼c.; thin weights 6¾@7¾c.

Reading for the Young.

HOW THE DAY ENDED.

BY MAUDE MEREDITH.

I SAY, Tilly, got the baskets all packed? Here, what's to be done with this sort of a pie-thing with a cake laid over it? Oh, it's a "picnic pie," eh! well! everything in? Hallo! here's the team. I say, all aboard!

"All aboard for Oak Grove Spring!" cried voices from the barouche, and Clyde hurried out, followed by his sister Tilly.

Clyde and Matilda Barton, as Aunt Mehitable called them. She had "brung up" sister Sara's children. Sara was never a very considerate, calculating sort of a woman, and this last of all, leaving two little helpless children, while she quietly slipped down into her grave under the daisies beside the soldier husband, was the most inconsiderate of all, so Aunt Mehitable thought, and she ought to know about it, for she took the children home to her little yellow house at the end of the street, and though Clyde had grown up a merry, manly fellow, and had been able in a short time to bring in his weekly wages, and little Tilly, after the few first years of mumps and measles, had shown her tact in decorating the little house and desolate, weedy yard, Aunt Hitty had "all she could attend to to keep the bugs off the taters and the weeds out on the onions," yet to-day, as the carriage load drove off, Aunt Mehitable sighed, looking after it, and murmured, "Such a site of trouble children is; but then it was dreffal like Sara to do so."

Aunt Hitty would never realize that she was growing old and feeble, but Clyde, now almost a man, more manly with his 18 years than many a one at 25, was her sole support, and that little Tilly, already 16, had nursed her through ails and attacks of rheumatism innumerable, she saw, as is the habit of the world, only her own virtues and the obligations of others to her. Meanwhile the merry picnic party bowled along, joined now and then by others, until some 30 or 40 merry young folks met at the Spring. It was a day on which to be merry, the Summer holiday, July 4th. The little Western village seldom invested in powder on such occasions, and only some of the young people, decorating their horses with innumerable little flags, improved the day for picnicing, Oak Grove Springs being the pleasantest resort. Games of quoits and base ball, where some of the girls "surely, surely," had fingers broken, so they declared at least; skiff rides on the river and the picnic dinner finished out the day, and tired and dusty they returned home at an early hour, quite satisfied with their patriotic endeavors.

After the teams were returned and paid for, as they lounged out of the little office, which was also the bar-room, an ugly question came up in the minds of the boys, what to do with the evening? Most of them were at some kind of employment in the village, and this one day in the year business was set aside and the windows closed.

"Let's go boating," suggested Clyde Barton; "there is a full moon and it will be lovely; cool, too! We can race if we choose, two to a boat, you know. What d'ye say, boys!"

"*I* say my new shoes pinch awful," and Charlie Herne ratrly took a limp step or two.

"Go up to your room and change them, suggested Roy Carman, "we'll all go along." And off they started.

Charlie Herne was a clerk in the post office and slept in a room just back of it.

"I'll have to be back in an hour, when the stage comes in," said Charlie.

Tom Haseltine stretched his six feet of indolent manhood on Charlie's bed with a yawn. "I say, boys, I'm tired, let's get us a lunch and, I say, some of old Bob's good cider, or—stay! Becky Stout made lots of wine from her grapes last year, and now she wants to sell it. That drunken scamp Tom Brown says she has mixed whiskey with it, for it is too much for his perpendicularity, but I don't believe it; she gave me a little taste one day—awful stingy little drop—but it was rousing good, now I tell you! Nothing but home-made, you know, boys," he said with a winning tone of voice and a good natured smile.

Then followed a little discussion for and against—boating or supper. Harry Hereford holding out stoutly against the supper.

"It's all very well, he said, "but me and Clyde knows just how it will be; there aint one of us used to cider, even, and we'll get stupid and silly and like as not fight and shame ourselves and every one belonging to us. I know I wouldn't want *my* mother to know of it, would you, Clyde, if you's in my place?"

Clyde and Harry were the best of friends; both brave, honest boys trying to do right. Harry, for the sake of his widowed mother, whose idol he was, and Clyde from a manly instinct, and a feeling that loving little Tilly had no other friend and protector, and he needs must be a man. But numbers over-ruled and the two friends at last said aside to each other: "We don't need to drink, we'll just have a pleasant time and not touch the wine."

And steadily they adhered to their decision, until late in the evening, after the stage had gone and the wine had began to effect the spirits of the boys, who now began persistently to banter the two who were conspicuous by their repeated refusals to drink.

At last, half shamed by the raillery received, Clyde and Harry promised to take one small glass each if the boys would then go home. The promise was readily given and, at a wink from Tom, a liberal dose of clear whisky was poured into each glass and they were then filled with wine.

The boys, unsuspecting the cheat, drank off the contents of the glasses, and then arose to go, but, by a sort of combined effort from all the party, they were detained a few minutes for this and for that, the boys purposing to have some fun at the expense of "These temperance fellows, that were so afraid of being drunk."

A queer feeling of torpor, a being lifted up into dreamland was creeping over their senses, at which their companions winked and chuckled inwardly, and at last declared they were thirsty.

Harry who grew merry, called for more wine, but Clyde, naturally quiet and thoughtful, grew sullen under the effects of the mixed liquor, and at first remonstrated, then querilously accused the boys of foolishness, then of meanness.

By this time Harry had swallowed down two or three glasses, and uproariously insisted on Clyde's drinking, at last, thoroughly angered, he cried, "Yes, I'll drink another glass, like a fool, and then Harry Hereford, you'll go home."

Some of the boys still sober enough for mischief, filled the glass nearly full of whisky adding a little sugar and wine. Clyde had never tasted either before, so he took the draught unconsciously, and dropping the glass caught Harry by the coat and endeavored to force him away. But Harry, wild with the drink, his merry nature seemingly turned into foam, he laughed, shook off the hand, bantered Clyde, and finally, catching up another glass, cried, "Drink, drink to the merry god! Swear by Bacchus! swear! drink!" trying to force the cup to his lips.

At this the other boys set in and a general good-natured scuffle followed, but out of which half of the boys came with red hot tempers, pulling off of coats, "squaring off," and with many a stagger, declaring themselves ready to "find their honor" at any cost, and a general melee followed, Harry still sensible enough to follow close after his best friend, Clyde. The door was pushed open, Tom's burly weight fell against Clyde, throwing him upon the wide, stone step. In an instant he gained his footing, struck out in the half-darkness, at the figure near him, whom he supposed to have struck him.

A moment more and a very white, sober face leaned over a face yet whiter, upturned in the moonlight. From a ghastly cut across the temple flowed a stream of red, red blood, and the chilling lips whispered—"O, Clyde, you did not mean to ——" then a heavy sigh, and Harry Hereford lay dead.

A hush fell on the little group as Clyde gathering the head up on his knee tried to wipe away the blood, muttering incoherent words of endearment to his friend, the merry boy, who could now never answer him back again.

At last he cried, throwing up his arms. "Oh, *don't* stare so! don't Harry! for God's sake look away! oh, just a minute! just a minute!" and springing to his feet he dashed away through the alternate lines of moonlight and shadow and was lost to sight.

Slowly then the clouded minds of the terror-stricken revelers began to act. At Charlie's orders poor Harry's body was raised carefully and laid on his own bed, and one after another the boys straggled off to tell the dreadful news to the older people.

At last Harry's mother had to be told the terrible truth, and the blow on the already shaken constitution was too severe. A deadly pallor grew slowly up from lip to fore head, a strange ashen blue, the eyelids quivered a moment and were closed forever.

Harry and his mother were buried side by side, and then for the first time the neighbors turned to the living. Clyde had not been seen, could not be found though they advertised in the nearest papers, telling him to come home, there was no arrest to be made, he had not struck with any murderous intentions, and only that Harry's head had hit the sharp corner of the scraper by the door mat, he would not have been hurt. Yet no word or tidings came.

Aunt Hitty bewailed the luck that followed Sara and her children, and poor little Tilly, almost broken hearted, crept out in the shade of the Summer trees, a terrible weight falling on her young heart, she drew away from all companionship, and the little village left her alone with her grief.

By and by she took to long rambles away by the river side, and off over the fields of grain, hoping always, vainly, that under some shrub or tree she should find her brother. Thus she wandered on, always picturing him as perhaps asleep in the shade of this corn field, and then not finding him, thinking he would surely be sitting under that cotton-wood, tired, and forlorn, heart-broken by his terrible deed, dreading to be alone, yet fearing the face of man. Though she would rush up to him, throw her arms about his neck, tell him how every one pitied him, and no one really blamed, no one wished to deliver him into the hands of the law, in fact the law had no hold on him.

Over and over she pictured the meeting, how she would lead him home, how she would comfort and caress him, and in her anxiety for her brother forgetting her own misery. For in her girlish heart Harry had been the one ideal hero, while Clyde had filled the place of father and mother and kindred: he was all she had, her brave brother.

One day when the westward sun threw long slant shadows over the field, and the trunks of trees stretched out gaunt black ghosts of shadows toward the east, Tilly turned slowly homeward. A month had now passed and not a word had reached them from the lost Clyde. Had the law reached its searching fingers forth, no wood would have been sufficiently dense, no hamlet far enough removed to have hid him. But only the friendly interest of a little village, and the agonized fear and love of one little sister searched after him, and no word came, no trace was found.

Slowly, sadly she turned her steps homeward, scarcely heeding the course she took, when suddenly the sound of a voice arrested her, a voice from out of the very ground, smothered, indistinct, strange, yet familiar singing that old song, "Over the Sunset Hills," the very words she and Clyde had sung so often together, accompanying themselves on their mothers old harmonia.

Tilly clasped her hands and held her breath, looking eagerly on every side, thinking she should see the handsome face, and springing form of her brother come suddenly in sight from—she hardly knew where, but he did not come. The voice died out, then began again.

The sun had gone down now, and a cool breeze shook the leaves on the oak, and rustled through the long lances of the corn in the field beyond. Perplexed and frightened, fearing some hidden tramp yet held by something in the voice, she drew nearer and nearer the sound, then all was still, and she waited. A hermit thrush burst forth in rapturous song, and a whip-poor-will called wierdly close at hand. "Hush, oh birds!" she cried, and the sound of her own voice in the gathering shadows startled her.

Then the voice began again:

"Over the purple hills, my darling,
Over the sunset sea."

A waver in the next line and then in full clear tones:

"I'm coming, coming to thee."

There was no longer any mistaking Clyde's voice and Tilly rushed forward crying "Clyde! Oh, Clyde!" when a voice from an old deserted mineral shaft at her feet, answered, "I knew you would come, Tilly. The angels always hear if we sing," and Tilly white with delight kneeling by the shaft peered over in the darkness, crying out her joy and gladness, telling Clyde all the cheering words her full heart could think to say, and, begging him be cheerful and wait until she brought help, she rushed away to the village and soon with lanterns and ropes and rope-ladders, half of the village turned out to the rescue.

When with shouts and words of cheer the villagers gathered around the shaft, no word of answer came to all their calls, and at last thinking hunger had exhausted him and he slept, a rope ladder was hastily lowered, and poor Tom Haseltine, who could never forgive himself for being the first cause of all the harm, tying a rope about his chest, with nervous, tremulous fingers fastened a lantern to his shoulder and began the descent. The shaft was deep, and it was some time before the slacking ropes showed that Tom had reached terra firma.

There was a suppressed sound of words and then a call for "more ropes" and after a long interval, in which a strong cable was lowered, the cry "Heave away" and slowly hand over hand, two of Centralia's old miners, standing on planks that spanned the mouth of the pit, drew the burden up.

Whispers of "Is he dead?" "Can he be asleep?" "What is the matter?" ran round the circle, but Tilly, breathless and motionless, gazed down into the darkness.

Slowly the moon began to rise over the eastern prairies, and scattered, like bits of gold, its yellow rays among the oak branches, and silvered, here a broad strip of sward, there a white bowl of a silver birch, and at last fell on the men as they stood on the heavy planks.

"Stand back!" and the crowd swayed and gave room. Tilly fell on her knees, and bent her face low, while one stepped upon the plank beside the other, and Charlie Herne drew the other plank out of the way. Slowly the burden came up to the clear cold moonlight. A shudder ran through the crowd. The hair was matted, damp, the face and clothes covered heavily with the clinging yellow ochre, and the gaunt, hollow eyes were wild and sightless. Clyde Barton had crossed the

"——Mystic river
That flows from the unknown sea."

Only "a little of old Becky's wine," only a "little fun," as Tom had thought it, when he smuggled in a half pint of whiskey from the drug store, but on Tom's heart in letters of blood are written the words: "Look not upon the wine when it is red, when it giveth its color to the cup."

The Puzzler.

A PYRAMID PUZZLE.

A vowel; a cape of New England; mountains of New England; a river of Virginia; a city of Kentucky; the centrals form a vegetable.

☞ Answer in two weeks. L. O.

A FRACTIONAL PUZZLE.

Take one-third of rug; one-fifth of sloop; one-fourth of junk; one-eighth of iron-clad; one-eight of schooner; one-ninth of canal boat; one-ninth of steamboat. Take one from each and form a vessel. O.

☞ Answer in two weeks.

A SQUARE WORD.

A city of China; a bird; a city of India.

KIND WORDS FOR THE RURAL NEW-YORKER.

FROM DR. JOHN A. WARDER, Hamilton Co. Ohio.—"Your elegant Fair Number has come."

FROM WALTER A. WOOD M. & R. M. Co.—"Your Fair Edition is all you claim for it. It is a 'bouncer'!"

FROM A. B. ALLEN, founder of the American Agriculturist.—"I am in receipt of the Fair Number of the RURAL. It is beautifully gotten up, and the contents are well varied and highly useful. The Number is in fact alone worth the amount of a year's subscription. I think it does you great credit. I hope it pays for the enterprise. My good friend, Mr. Mead, has given an excellent description of the Rural Farm."

FROM PROF. A. E. BLOUNT, Fort Collins, Col.—"I am getting more and more "in love" with the RURAL. I like your management of the paper. It is full of life, vigor, enthusiasm, agricultural and journalistic force."

FROM F. K. MORELAND, Ogdensburg, —"It deserves and fills a position in the farmer's household, that can be filled by no other journal."

FROM PROF. J. P. SHELDON, ENGLAND.—"You are improving the quality of the RURAL, which is a very valuable paper to those who are engaged in agriculture and horticulture."

FROM GEO. S. WALES, the nurseryman of Rochester.—"You publish a *remarkably good* paper and if I did as well as you do, I should appreciate an encouraging word as well as a good long subscription list, for an editor's place always seems to me a thankless one, so I only do my duty when I say I think your paper is *ably* and *honestly* edited."

FROM J. B. ARMSTRONG, Editor Daily Republican, Santa Rosa, Cal.—"THE RURAL NEW-YORKER for 1880, promises to excel its former self, which is saying much. We have read it many years, and year by year found it growing better, until now it reaches out and embraces about all the specialties of importance in which farmers and fruit growers are interested."

FROM JAMES J. H. GREGORY, the seed-grower of Marblehead, Mass.—"You have made the RURAL a tower of strength botanically as well as in other directions."

FROM J. T. LOVETT, the small-fruit grower of Little Silver, N. J.—"I am literally overwhelmed with letters and applications for catalogues. The RURAL is returning me double what it did in former years."

FROM B. F. JOHNSON, Champaign, Ills.—"You ought to be proud of the Fair Number of the RURAL, both on account of its editorials and contributed articles, and the vast display of advertisements which business men do not usually give to sheets without circulation and without influence."

FROM E. P. ROE, the small-fruit grower of Cornwall, N. Y.—"I like your plan of testing and reporting on varieties very much. The only way we can learn the comparative value of varieties is to test them all together under the same conditions. I congratulate you on the success of the RURAL. You are certainly making an interesting paper of it."

FROM THE CALIFORNIA HORTICULTURIST.—The RURAL NEW-YORKER for July 10th contained 1,000 special crop reports from all parts of the United States. These general reports, for which this journal has acquired a reputation, are worthy of high commendation."

FROM SUBSCRIBERS.

"I cannot tell you how much we like the RURAL and how much we have missed it for the last two weeks. I heard my wife say last Saturday evening when our mail was brought from the Post Office, that she did not care even to look at it now that the RURAL did not come.

Gloucester Co., Ala. JOHN H. P. SEAWELL.

"I cannot let this opportunity pass without acknowledging my appreciation of your valuable paper. I consider it the best weekly paper published in America for the farmer or gardener or any other. The Horticultural Department is my favorite. I consider it ably conducted and so far have found it reliable. I think the seeds you sent out last year will prove of great benefit to your subscribers and the community where they live. The Beauty of Hebron Potato was a grand success here in Minnesota, yielding for me, with ordinary treatment, two bushels from each pound of seed. The Bronze Lettuce is A, No. 1. for early market purposes; but unfortunately, it failed to produce any seed for us. The seedlings of the hardy plants promise well."

Houston Co., Minn. J. S. HARRIS.

"I expect to be a life member, or rather subscriber; for your market report on wool last year saved me over $1000, as our San Francisco papers never give us the advance until the speculators have a run of our State, and purchase all the wool and wheat, and, in fact, every thing else in the speculation line."

Fresno Co., Cal., P. C. APPLING.

"The information received through the RURAL is—unlike most of that in agricultural papers—practical; and subscribing for it is a good investment." W. S. ROBINSON.

Westmoreland Co., Pa.

"Accept thanks for the splendid tea set received from you as premium for RURAL subscribers. It is *beautiful* and surpasses (if possible) all former premiums. I have been an agent for the RURAL 27 years, and I have received a score of premiums, and have yet to see anything sent out that was not first-class and satisfactory in every respect. I shall strive to give you an increased list of subscribers for 1881. JOHN S. CLARK.

Seneca Co., N. Y.

"My Golden Ovoid Mangel grown from the seed sent out by the RURAL, took the first premium at our County Fair.

Chemung Co., N. Y. J. T. GRIFFITHS.

"The RURAL NEW-YORKER has not its superior in America or Europe."

Logan Co., Ky., T. S. GARDENER.

"I like your paper *exceedingly* well. The big potato has brought me $2.00 now."

Middlesex Co., Mass. GEO. E. METCALF.

PERSONAL ITEMS.

Moody and Sankey are going to "revive" the Californians.

George Bancroft, the historian, celebrated his eightieth birthday at Newport, on the 2nd inst.

Count de Chambord, the head of the Legitimist party in France, has just completed his sixtieth year.

MISS HELEN GLADSTONE, the daughter of the Premier, is one of the successful candidates in this year's class list of Cambridge University examinations.

George Washington Childs, owner of the Philadelphia Ledger, and Anthony Drexel, the banker, have bought 630 acres of land near Philadelphia, and intend to make a popular suburb of it.

Ex-Gov. Hubbard, of Conn., is about to give up his law business and go to Europe with his family. One of his daughters who married his coachman some months ago, is now a seamstress in Hartford, and her husband still drives a coach.

Jacques Offenbach, the celebrated musical composer, died on Oct. 5th, at Paris. He was born of Jewish parents in 1819, at Cologne, in Germany, but went to Paris when 14 years old. He was the originator and prince of Opera Bouffe, having composed all the best works of that type, and as manager brought out quite a number.

Business and Professional Men,

and all who, in consequence of overwork, find themselves suffering from a gradually increasing brain and nervous exhaustion, and who feel that they are slowly losing vitality and the power to do their best, and that a breakdown in the near future is almost inevitable, will find in Compound Oxygen a new agent of cure and restoration, *which acts as a revitalizer*—and this with a promptness that at once stops the downward drift. The paralysis which so often arrests the steps of business men and hard brain-workers after they have passed middle life, might in most cases be prevented by an occasional use of this revitalizing agent. Our Treatise on Compound Oxygen, its Nature and Action, is sent free. Address Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

KIDNEY-WORT

PERMANENTLY CURES KIDNEY DISEASES, LIVER COMPLAINTS, Constipation and Piles.

Dr. R. H. Clark, South Hero, Vt., says, "In cases of Kidney Troubles it has acted like a charm. It has cured many very bad cases of Piles, and has never failed to act efficiently."

Nelson Fairchild, of St. Albans, Vt., says, "It is of priceless value. After sixteen years of great suffering from Piles and Costiveness it completely cured me."

C. S. Hogaboon, of Berkshire, says, "One package has done wonders for me in completely curing a severe Liver and Kidney Complaint."

IT HAS WONDERFUL POWER. WHY?

Because it Acts on the LIVER, the BOWELS and the KIDNEYS at the same time.

Because it cleanses the system of the poisonous humors that develope in Kidney and Urinary diseases, Biliousness, Jaundice, Constipation, Piles, or in Rheumatism, Neuralgia and nervous disorders.

KIDNEY-WORT is a dry vegetable compound and can be sent by mail prepaid. One package will make six qts of medicine.

TRY IT NOW!

☞ Buy it at the Druggists. Price, $1.00.

12 (Will send post paid.) Burlington, Vt.

Liquid KIDNEY-WORT

In response to the urgent requests of great numbers of people who prefer to purchase a **Kidney-Wort** already prepared, the proprietors of this celebrated remedy now prepare it in liquid form as well as dry. It is very concentrated, is put up in large bottles, and is equally efficient as that put up dry in tin cans. It saves the necessity of preparing, is always ready, and is more easily taken by most people. Price, $1 per bottle.

LIQUID AND DRY SOLD BY DRUGGISTS.

CLARK'S IMPROVED ROOT CUTTER

PERFECTION OBTAINED IN

CUTTING ROOTS

This Cutter has *received* the First Premiums *at every Fair*, and has no *equal*. Do not fail to examine it.

The Neatest, Strongest, Simplest, Cheapest, and most Perfect Root Cutter in the Market.

This Cutter is built with a heavy oak frame, well bolted together; is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of *twenty-five steel knives* (gouge shaped), so arranged on a wrought-iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are neatly cut in pieces suitable for feeding. No coarse, ungainly pieces are left by this Cutter. A boy can easily cut 35 to 40 bushels per hour, so easily does it do its work. ☞ Don't fail to examine it.

We are manufacturing three sizes, designated by numbers,—1 2 and 3.

Nos. 1 and 2 designed for hand use.

No. 3 is the Power Cutter, and will cut 100 bushels per hour.

FOLDING CHAIR CO., New Haven, Conn.

Humorous.

"ARE you lost, my little fellow?" asked a gentleman of a four-year-old. "No," he sobbed in reply, "b-but m-my mother is."

A NEGRO was suspected of surreptiously meddling with a neighbor's fruit, and being caught in a garden by moonlight, nonplussed his detectors by raising his eyes, clasping his hands and piously exclaiming:—"Good heavens! dis yere darkey can't go nowhere to pray any more without bein' 'sturbed."

"MAMMA, what must I say when I feel like being naughty?" said a little girl whose conscience had smitten her for some misdemeanor. "Why, my child, you must say, 'Get thee behind me, Satan,' and you will not be tempted," replied the mother. The little youngster paused a moment, and then said: "I did say that, and do you know, mamma, the old debil said: 'Ha! ha! I *am* behind you, and don't you forget it!'"

Mariners and Travelers

speak in high terms of the preventive and remedial properties of Hostetter's Stomach Bitters, a medicine peculiarly adapted to the wants of those called upon to experience the vicissitudes of climate, the inclemency of the weather, the hardships of a sea-faring or out-of-door life, or the dangers of a malarial or otherwise pestilential atmosphere. A small quantity of this agreeable tonic nullifies impurities in water, and fortifies the stomach against the consequence of an unhealthy or unaccustomed diet. It also enables the constitution to bear up unharmed against unhealthy climatic influences, and the system to sustain, unimpaired in health and vigor, the fatigues of traveling. Emigrants, tourists, miners and others who have thoroughly tested the efficacy of the article, declare it to be a sovereign preservative of health under conditions most unfavorable.

Library of Universal Knowledge.

Large Type Edition. A verbatim reprint of the last (1880) London edition of Chambers's Encyclopædia, with copious additions (about 15,000 topics) by American editors; the whole under one alphabet, with such illustrations as are necessary to elucidate the text. Printed from new electrotype plates, brevier type, on superior paper, and bound in 15 elegant octavo volumes of about 900 pages each. It will contain, complete, about 10 per cent more than Appleton's and 25 per cent more than Johnson's Cyclopædia, and though in all respects important to the general reader, it is far superior to either of them, its cost is but a fraction of their price. Volumes I. and II. are ready October 1, and other volumes will follow at least two each month, the entire work being completed by April, 1881, and probably sooner. Price per volume, in cloth, $1; in half Russia, gilt top, $1.50; postage, per volume, 21 cents. It has been our custom in previous publications to offer special inducements to those whose orders are soonest received. In pursuance of that policy, **October** **$10.** *on or before October 31 only*, we will receive orders, with cash, for the set of 15 volumes complete for the nominal price of $10 for the edition in cloth, and $15.00 for the edition in half Russia, gilt top. The price during November will be advanced to $10.50 and $15.75, and a further advance will be made each month till the work is completed. It is not supposed that the mass of those who will in time become purchasers of the Encyclopædia will make payment in advance as they now have the opportunity to do, though most of them *do pay* for their newspapers and magazines a full year in advance—but the old, tried friends of the Literary Revolution, who know that the American Book Exchange always accomplishes what it undertakes, and does what it promises to do, will be glad to save $5.00 by investing $10.00 and get the earliest and consequently best printed copies of the largest and best Encyclopædia ever published in this country, even at ten times its cost. Volumes will be shipped as may be directed, as they are issued, or when the set is complete.

Chambers's Encyclopaedia

As a portion of the Library of Universal Knowledge, we issue Chambers's Encyclopædia separately, without the American additions, complete in 15 volumes 16mo. In this style it is printed from new electrotype plates made from very clear nonpareil type. Price, Acme edition, cloth, $7.50; Aldus edition (finer, heavier paper, wide margins), half Russia, gilt top, **$7.00** $15.00. In this style 14 volumes are issued October 1, and volume 15 will be ready about October 25, completing the work. To those ordering during the month of October, the price of the 15 volumes complete will be $7.00 for the cloth, $14.00 for the half Russia, gilt top. During November the price will be advanced to $7.25, and $14.50 for the set.

American Additions:

The very large additions to Chambers's Encyclopædia (about 15,000 topics) which are made by the American editors of the Library of Universal Knowledge, will also be issued separately in four volumes of 800 to 1000 octavo pages each, large type; the price being $1.00 per volume in cloth, $1.50 in half Russia, gilt top; postage, per volume, 21 cents. Volume I. will be ready in October, and other volumes will follow as rapidly as possible, the whole being completed by April, 1881, and probably sooner. Price for the set of four volumes *during October only*, net, $2.65 for the cloth, $4.00 for the half Russia, gilt top. The four volumes of American Additions will be found well-nigh indispensable by all owners of Chambers's, Appleton's, Johnson's and all other Cyclopædias except the large type edition of the Library of Universal Knowledge, from which it is compiled.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. XXXIX. No. 43.
Whole No. 1604.

NEW YORK, OCT. 23, 1880.

Price Five Cents.
$2.00 Per Year.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Floricultural.

THE INDIAN AZALEA.

JAMES TAPLIN.

Readers of the Rural must not confound these plants, which are evergreen, with the hardy American and hybrids of the same, which are deciduous and stand our severest Winters unprotected; for with the exception of the old A. Indica alba and amœna, which will stand unprotected at least as far north as New York, most of the varieties are injured by a very little frost, and many of the newer varieties appear to be more tender than older sorts. This may be from growing the plants for a great portion of the year in hot, moist, shady houses to increase the stock and obtain large plants in as short a time as possible, as it is nothing unusual for many of the best growers to obtain two and sometimes three growths in one season, although the plants flower only once.

The Belgian growers make a specialty of these plants and send a large number to this country, besides sending them to all the markets of Europe. They also send out a number of new seedlings each year, including many fine varieties. They turn their attention to a great extent to doubles and semi-doubles, and also to an increase of size in the single sorts, paying less attention to the shape and substance of the flower than the English raisers of seedlings, a fact which may be confirmed by comparing any half dozen varieties raised in the two countries. But the double and half-double sorts last much longer in flower and are also of more service if required for cut flowers, for which they are very useful, especially in the Winter and early Spring; for by selecting the early-flowering varieties and growing them early in heat, and then keeping them as cool as possible through the Summer, and afterwards giving the plants a warm, moist house, it is easy to have them in flower at Christmas, although they are usually of most value at Easter.

Many people have complained to me that they have little success with these plants when grown as window plants. This is caused by baking them in the Winter in hot, dry rooms and allowing the plants to get very dry sometimes. If an azalea, the ball of soil of which is, and should be, full of its fine, hair-like roots, once gets thoroughly dry, no amount of watering short of soaking in a tub of water, will moisten it, and many of the roots are sure to perish. In a room heated to 70 degrees in Winter the delicate roots round the inside of the pot are undergoing a baking process all the time; but if grown in a room from which the frost is only excluded, it might be grown with success by placing it out-of-doors in the Summer.

Azaleas may be propagated from seeds and cuttings and by grafting; the seeds, being very fine, must be either sown on the surface of pots in fine, sandy soil, or, if covered at all, with only a dusting of fine sand, covered with a square of glass and sheltered from the sun, it being difficult to water them without washing the seed away, and they must never be allowed to become dry. It is best to stand the pots in a pan of water and so allow them to water themselves; the seed soon vegetates and if the plants are kept growing without check, some will flower in less than two years, when the best varieties may be retained and grown on, and any others, if required, may be used as stocks for grafting any varieties it is desirable to increase by that system. If the seeds are saved from good varieties, they will often vary considerably in growth and flower, but probably there will be nothing better than the parent plant, and possibly nothing so good. In some instances I have seen all the seedlings come exactly like the parent with scarcely a variation even in the habit of growth. A case in point was the variety called Stella, which is a good sort yet, and when sent out new, probably 25 years ago, was a grand improvement on the then existing sorts. A friend raised several hundred seedlings from it, and I saw them all in flower the first time, and every plant could have been sold for the original parent. The only way to get new varieties from seed is by careful cross-fertilization, when, if nothing new or superior to present kinds is obtained, there are sure to be many distinct and desirable sorts for home cultivation. There have been several fine batches of seedlings raised in this country and brought before the Floral Committee of the New York Horticultural Society, which, if well grown, would compare favorably with many of the European seedlings; and as the plants flower in about the same time as seedling geraniums, it is a good field for amateurs of leisure to engage in.

To propagate by cuttings it is only necessary to prepare some pots with fine sandy soil with a layer of sand on the top, to prevent damping; take off the half-ripened wood from two to four inches in length; remove a few of the lower leaves and cut to a joint; place them thickly near the edges of the pot; give a good watering, and place the pots in a close frame; shade from sun, and water when necessary; keep closed until they commence to root, and then give air and light until all are rooted, when they may be potted singly in small pots and treated as advised for seedlings. Many good growers turn the plants out of pots into a prepared bed of soil in a house or frame after a three-inch pot is well filled with roots, and grow them during a Summer on that plan, finding they make more growth with less care than when grown in pots. As the growth advances, pinch out the tops from shoots to form a good head. The second growth will flower at the proper season, and, of course, will have many more shoots than if not pinched. It is well to allow the plant to grow about a foot high without pinching; the plants then will have nice clean stems, in fact, they are miniature standards while small, and can be trained to any shape as they become larger, the pyramid being the most popular, and by judicious pinching that or any other shape may be obtained without much trying. The Belgian growers plant all these young plants out, but they use decayed leaves for the purpose, which combined with abundance of water induce a quick and very fine-looking growth, but the plants do not generally grow so well afterwards, and if that soil becomes thoroughly dry it is almost impossible to moisten it again. I have put such plants in a tub of water for a night, and found only the outside wet in the morning. I have also found the light kind of soil employed for potting azaleas in Europe not so satisfactory in this dry climate, as the moisture evaporates too quickly and the best roots perish.

Grafting is not of much importance to amateur growers, and is not much employed in this country, except to increase new and scarce varieties, and for a few of the weak-growing sorts, such as the variegated section, by grafting which a year is gained in the size of the plants. But to propagate by grafts requires a hot-bed and more care than many have time to devote to the job, and a number of cuttings or seedlings must be prepared for stocks the previous year. As regards soil, any soil free from lime will grow them more or less satisfactorily, clay and bog peat being the worst, and a good upland peat, and a good, friable loam in about equal parts, the best. If the soil contains little sand, some clean sand should be added, but as the soil, even in two parts of a small garden, is seldom alike, a novice can try the most likely to be found in his district. I have a loam here which will grow azaleas equally as well as it does roses, but that is not often the case. I may add that it is necessary to make the soil very firm in the pots at all times in potting azaleas, and also to see that the drainage is perfect, for the plants detest stagnant water. When the plants are large and in vigorous growth with pots very full of roots, and it is not desirable to increase the size of the pots an occasional watering with weak, clean liquid manure is of great service.

If plants are kept in good health and frequently syringed over-head while growing, insects are not troublesome, but occasionally a plant will become infested with thrip or red spider; then a dip in a mixture of tobacco water, soap and sulphur will clean it. I usually give about two dippings during the Winter when plants are not growing; and seldom see an insect during the Summer. I prefer keeping plants indoors during Summer, but there is no objection to placing them outside if necessary, if precautions are taken to prevent worms from entering the pots, and if the same attention is given them as inside. The main objection to keeping them outside is that the plants are often expected to look after themselves, for which reason I have seen many fine plants spoiled past recovery. Young plants which are expected to make more than one growth must be kept inside, whether grown in pots or planted out.

Among the many sorts at present in cultivation it is difficult to name a list from so many good kinds, but I will give a few of the most popular and distinct which are all very fine: Baronne de Vriere, pure white, one of the largest flowers I have seen; Bernhard Andreas, deep rose, very double, one of the finest; Bernhard Andreas alba, one of the best, if not the best double white known, when true; but out of a dozen I once received but two, the remainder being another white not nearly so good. It does not make so much wood as many others; Bijou de Paris, pure white striped with rosy carmine; Borsig, one of the most popular double whites; Charmer, bright amaranth; Daphne, pure white stripped with pink; Due de Nassau, rosy purple; Extranei, violet rose, a fine shade, an old but very fine sort; Juliette, fine-shaped rose; La Victoirea, fine orange flower, with dark blotch; Madame C. Van Langenhove, white striped with crimson, very fine, Flag of Truce, double white, one of the best trade plants, but late importations have been much diseased; Madame C. d'Hamall, pure white; Madame Vandercryssen, rose, fine; Madame Marie Le Febvre, very large white; Mrs. Merritt, violet-rose, semi-double; Mrs. William Bull, white, large and fine; Neptune, orange, shaded with violet; Rubens, bright scarlet, fine; Souvenir du Prince Albert, rose and white, very double, one of the best.

AZALEA, MRS. CARMICHAEL.—After B. S. Williams.—Fig. 336.

CHINESE AZALEAS AS WINDOW PLANTS.

The Chinese or Indian Azalea—Azalea Sinensis, or Indica—is one of the chief plants employed at the present day in most well-fur-

nished greenhouses or conservatories, yet of its unquestionable value as a window plant we hear little said. All over Europe, we find this peculiar value of the Chinese Azalea abundantly recognized. Uncounted thousands are used there every year in the humblest homes, but in America the same culture seems to make its way slowly. Let us consider a few brief directions for successful azalea culture in the dwelling-room,

Buy the azaleas you propose to cultivate in the room, some time in October, when they have fully matured their leaves and buds. It would not be advisable to bring them in as soon as October, if it were not for the danger of sharp frost during that month. In any case, they must be set out in the open air as much as possible during days that are not positively frosty to harden both leaves and buds and fully prepare them for the trying changes of a dwelling-room in Winter. When Winter has fairly set in, the azaleas should be placed permanently in the room it is intended they should occupy, and in the lightest and sunniest of its windows. If at all convenient, windows with southern and eastern exposures should be selected, for the light from these quarters produces earlier and better flowers than that from the north and west. Thus, while in late February or early March we can have flowers on azaleas exposed to the east and south, at least a month more must elapse before the plants looking elsewhere for light, can bloom. Water moderately and only now and then while the azaleas have not as yet begun to grow. During full growth, however, be quite liberal in this respect. The tendency which azaleas often show in the dwelling-room to suffer from thrip, green fly or red spider, may be overcome by dipping their heads once or twice a week in tobacco water. This treatment must be followed up with increasing care until Spring advances sufficiently for the plants to be safely plunged in the open ground.

About the middle of May usually, Chinese Azaleas may be safely set out or plunged pot and all. If the top of the pot be set an inch or two below the surface of the ground and immediately well watered, the plant will continue to put forth and ripen new sets of leaves with no other moisture than dew and rains. Once in awhile, during dry, hot weather, artificial watering may be done with great benefit. At least once in two years, if not every year, a fresh potting should be given window-grown Chinese Azaleas. I am assuming that young plants of moderate size are employed. Old, large plants may remain in the same pot several years without becoming pot-bound or stunted. Whether a larger pot be used or not, will depend on the growth the roots have made during the last one or two years. Fresh soil should be used in either case, composed of rich, sandy loam mixed with a liberal quantity of old, well rotted manure Before potting, remove about an inch of the soil from the ball of roots, and compact, instead, the fresh earth firmly round about the plant in the pot. Chinese Azaleas like this treatment. Water should be now given in small quantities and at short intervals in order to soak the potting earth thoroughly. But we must not forget the pruning! It is important. First, cut back hard in early Spring the stems and twigs that have just bloomed in order to start out a vigorous young growth, and then pinch the strongest young shoots at their extremities from time to time to develop strength and symmetry. Do not strive too much for absolute regularity. All azaleas naturally arrange themselves in layer-like masses with strata of flowers piled one upon the other. This being their natural habit, it seems a pity to clip the plant into absolute formality.

In conclusion, I subjoin a list of a number of the varieties best adapted to window culture, for many kinds have buds that are so constituted as to drop or become injured by the peculiar conditions of a dwelling-room. Some kinds, again, are in every way hardier than others. Of those that are suited to window gardening it may be said that no better or more easily managed plants exist for that purpose. A list of varieties well adapted for window culture may be made as follows:—Amœna, Fielder's White, Indica alba, Belle Gantoise, Brilliant, Burlingtonii, Distinction, Criterion, Delicate, Eulalie Van Geert, Flower of the Day, Iveryana, Murrayana, Perfection, Frederick the Great, Georgiana, Leana, Mad. Amoroise Verschaffelt, Marie Vervaine, Alexander II., Miltonii, Queen Victoria, Racemosa, Senator Kessler, Standard of Perfection, Adelaide of Nassau, Obtusa, etc. The engraving annexed represents the variety Mrs. Carmichel. It forms an excellent example of the best modern improved hybrids of the Chinese Azalea. S. PARSONS, JR.

House-Plants.

The season for out-door plants for this year is about over, and arrangements must immediately be made for the in-door plants, if one wishes to enjoy their beauty and fragrance the coming Winter; and I certainly wish that no family who read the RURAL NEW-YORKER should be entirely destitute of a few choice house plants. In Winter, when no flowers are seen out-of-doors it is very pleasant to have a few flowering plants in the house. They are a source of enjoyment not only to the owner indoors, but they cheer and enliven the spirits of the passers-by. I know of a bay window in this town that in winter is always beautiful, and is daily admired by many people who pass it, and they often stop to take a closer look. It is a fact, I think, that the cultivation of window plants is yearly becoming more popular, and I am glad to see it so. All who wish to make homes beautiful, should cultivate flowers in the house in winter, as well as out-of-doors in Summer. F. H. D.

Corning, N. Y.

Field Crops.

RURAL BRANCHING SORGHUM.

THERE is need for more fodder crops. The feeding of cattle for the production of milk and butter promises to be one of our most profitable branches of agriculture, and a prolific fodder plant that will permit of cutting freely and will quickly recuperate after the cutting, will be of great value. The Rural Branching Sorghum is such a plant. A careful test of this plant this season has proved its qualities, and a history of this season's experience with it may be interesting.

On account of the unusually dry weather in the Spring, the planting was delayed until May 21st. This was fully a month later than the first planting of sweet corn. The soil is a sandy loam, and was manured with well rotted cow manure at the rate of about 16 tons per acre, and a light dressing of lime. The soil was in fair order and by no means rich; equal only to fairly good corn land that would make 50 bushels of corn per acre. The seed was planted in drills opened with a plow and covered with a hoe, about three inches deep. It appeared above ground in four days after planting, notwithstanding the soil was very dry and no rain fell. On account of the dry weather it grew slowly, but after rain fell it shot up with remarkable vigor, branching or tillering very freely. The seed was dropped three inches apart, but the tillering brought the stalks to within an inch of each other as they stood in the rows. On July 9, the plants in one row were cut and fed and all were eaten up clean by the cows, the stalks being wholly consumed. On August 21st, the other rows were eight feet seven inches high, and until the dry weather came were growing three inches a day. On that day twelve stalks, cut from one foot of row weighed nine pounds, which would be equal to 65 tons per acre. The row which was cut on 9th of July, is now (Sept. 30) over six feet high and has blossomed. Part of the row, of second growth was cut the second time, and on Sept. 30, was two feet high and had thickened up considerably. On account of the close planting the stalks are fine, none being more than three-quarters of an inch and the majority less than half an inch thick. The stalks are now over 11 feet tall and have passed the blossoming stage and promise to mature seed. Some stalks were cut to-day (Oct. 4) and given whole to cows and a horse. The cows ate all but a few pieces of stalk, but were not hungry, having been all day on good pasture. The horse ingeniously managed to take his stalks by the blossom end and chewed up the whole by degrees without letting go. This animal evidently chose the best manner of disposing of them.

On cutting some sections of the stalks for examination under the microscope, they were found full of starch grains, and in one stalk, which had been touched by the frost, a few crystals of sugar were found. On chewing a piece of this stalk, it was found to be nearly as sweet as the Amber Sugar-cane. The starch grains were so plentiful that they adhered to the fingers when the sap dried upon the hands after cutting the stalks, and on scraping these dry granules off and examining them under the microscope, they appeared as small as the grains of rice starch and very much smaller than those of corn, wheat or potato starch. The large quantity of starch contained in the stalks goes to show that they must be unusually nutritious. The season has been remarkably unfavorable. Long-continued dry weather has seriously stunted the corn crop and has curtailed the growing season at least one month. But for this, the sorghum would have ripened seed at least two weeks ago. The frost of the first of October which killed tomatoes, has very slightly touched the sorghum, discoloring a leaf here and there, and only seriously touching a few of the stalks at the end of the rows. It is at least as hardy as corn.

This new fodder plant evidently promises to be a valuable addition to our list of feeding crops. From its habit of growth and ability to stand repeated cuttings, it would probably produce the most fodder by being drilled in rows 12 to 18 inches apart, and cultivated with an implement arranged for the purpose; then cut when three or four feet high with the mower and left to grow up again, which it will do very quickly thickening up very much in its second growth. Three cuttings may be easily made and the last growth may be pastured down at the end of the season. This method would produce soft, fine, succulent fodder which would be consumed without any waste whatever. HENRY STEWART.

RURAL SEEDS, ETC.

THE Cow-pea grows astonishingly and is relished by sheep. It ripens easily in this climate—in a line with Utica. It is very prolific, and is evidently of real value. Blount's Corn ripens with me and bears from two to three ears to a stalk. My hired man has difficulty in carrying a dozen stalks in his arms. For fodder and for seed it is only inferior to Moore's Concord Sweet Corn which is, in my judgment, the unrivaled corn up to date. Mold's Ennobled Oats are a marvel of productiveness, rather late; about two weeks after the common oats. Straw short, and seed about double the weight of other kinds. The Siberian Fir seeds germinated; but the magnolias have not done so yet. I shall look for them for five years yet. The pentstemons are a failure. From your flower seeds in general I have secured not much of special value.

Among my notes for the year I find that corn fodder cut during the Summer and fed to cows, as compared with cut grass, gives milk as five to six; or lessens the supply about one-sixth. It ought to be fed not oftener than one meal out of three. The yield of potatoes in this section is less by one-third than last year; that of corn equal to last year's. Your crop reports are of great value; and your special numbers on berries, cereals etc., are inestimable. You have my sincere thanks for the real value of your work to myself. You have taken the lead by making your paper immensely useful.

Among the small fruits I find the New Rochelle Raspberry to be of great value; but with us Turner is practically worthless. [Are you postive that it *is* Turner? Eds.] It is sweet, soft, hardy and useless. Cuthbert and Gregg deserve all the praise they get. I am still much attached to Davison's Thornless Black Cap. E. P. POWELL.

Oneida Co., N. Y.

"SHALL POTATOES BE DUG TO PREVENT ROTTING?"

THE above question is put by friend Brownell in a recent number of the RURAL, in which he gives his experience in that line, and solicits the experience of others. In the first place, the answer depends upon certain circumstances, and one important one is, the place and conditions under which the tubers are to be stored; but, first, I would not permit the potatoes to begin to rot, if it could be prevented. This condition, however, is very likely to follow, if potatoes are left in the ground during a season of alternate showers and hot weather that frequently occurs in the early Autumn; and, such being the case, it is very reasonable to suppose that early digging would remove the potatoes from these unfavorable conditions; but at the same time if the potatoes are to be stored in a hot cellar, there are chances that they will then rot. On the other hand, if the cellar is cool and, withal, a little moist, and the potatoes are sound, I believe there will be no trouble with rotting. I can fully corroborate friend Brownell's experience in this line, and am fully persuaded that it is better for us to dig our potatoes to save them from rot, although I am aware of the general idea that if they are to rot, it is better for it to occur in the ground—which is all right, provided they are to rot; but this I do not believe is necessary.

My cellar is cool and what would be considered pretty moist in fact, in the wet season more or less water runs in the drains under the flagging. The potato bin is on one side of the cellar and directly over a drain, with open joints in the flagging. When I dig my potatoes they are put into the bin without even straw upon the bottom and with the sides against the wall, and yet they will keep, save as they disappear to satisfy culinary demands. I have had experience directly in the line of Mr. Brownell's, but the most marked and distinct occurred last season—the Fall of '79. Having decided to spend some time in Western New York, I dug a part of my potatoes in August, or as soon as the tops were partially dried, and put them in the cellar as described above, while the remainder were left in the ground until late in the Fall. The result was that, so far as I know, not a single potato of the first lot rotted after they were dug, while of those that were left in the ground at least half rotted during their stay there, but none of them did so after having been placed in the cellar. From the little experience I have had in that line, I am convinced that, other things being equal, it is far better to dig potatoes early, or as soon as they are matured, storing them in a cool cellar, and then I should have no fears of their rotting. WM. H. YEOMANS.

Tolland Co., Conn.

Planting Potatoes in the Fall.

In your experiment in planting potatoes in the Fall you hardly made the conditions favorable. The tubers when planted so deep—six inches—have not sufficient space, the pressure of the compacted soil checking the yield, causing the tubers to be badly shaped. If they had been planted at an ordinary depth, then hilled up, and the surplus earth leveled in the Spring, a better crop would have been harvested, and the tubers should be planted whole, so that their vitality would not be impaired. My experiments have always been confined to early varieties for early use, the soil yielding to the growing tubers better in the fore, than the after part of the season, when more compacted by drought and time. D. S. MARVIN.

Horticultural.

RURALISMS.

There have lately been many inquiries in the RURAL about the fig. There are perhaps few who know that this fine fruit can be successfully grown in the vicinity of New York city and somewhat north of it, without lifting the plants in the Fall. The fig is not entirely hardy here, but it needs no great amount of protection during the Winter, without any disturbance of the roots; and this protection is easily given when the plants are grown in the right way. Mr. L. H. Meyer, of Staten Island, has had a plantation of figs for many years, and has never lost a crop, if I remember rightly. He never disturbs the roots of the plants. Mr. Downing used to grow it successfully at Newburgh. His plan was to loosen the roots, bend the plant down, cover or bury it for the Winter and reset it in the Spring. There are two other ways in which I have grown a few plants successfully; but by far the least troublesome, and as good as any, is the plan adopted by Mr. Meyer. The ripe fruit of the fig is healthy and refreshing, and should be grown by every one who has a place for it, if only a single plant. It is necessary to begin with small plants.

I am sorry to say I have discovered another source of anxiety for the strawberry grower. Noticing on a rainy day that the young leaves of some plants here and there were drooping or lying detached, I made a close examination and discovered that the mischief had been done by slugs. The point of attack is the crown, where the leaves are tender, and where much harm can be done. The owner of the plants will be on the watch for further developments. Looking at the right time, I discovered four cases in my own beds, with the slugs at work. Those who understand the nature and habits of the slug will look with apprehension to its spread to the strawberry field. It has been multiplying very fast among us for several years, and gives us a good deal of trouble in the greenhouse during the Winter. The slug works while men sleep.

Not long since I saw, at Mr. S. P. Carpenter's, the original tree of the Geo. Peabody Arbor-vitæ (Thuja). It was nearly twenty feet high, and handsomely furnished from top to bottom. It is quite hardy and exceedingly ornamental, retaining its beautiful golden hue during the hottest of Summers. It is a fine tree for the lawn. At Mr. Hance's, and also at Mr. Lovett's, I saw medium-sized but very fine specimens of Biota, *var.* elegantissima, another fine arbor-vitæ of recent introduction, and resembling Geo. Peabody in general appearance. This also retains its beautiful golden hue during the Summer, and is a fine subject for the lawn. In Western New York I am told it is not hardy; but it seems to be quite so in the sandy soils of New Jersey, Long Island, and some other places. A tree of doubtful hardiness should never be planted in a rich soil. For small lawns, where tall and spreading evergreens are inadmissible, there is nothing more appropriate than the arbor-vitæs and retinosporas.

The talk now is for an agricultural college, to be located in New York city. There is no place for an agricultural college in New York that I know of. An agricultural college without a farm attached is an agricultural absurdity. Cornell would seem to answer for the present; but if we are to have another, or one purely agricultural, New York city is not the place for it. Long Island or West Chester County would do; but let us first have the "Experiment Stations" under way. In attempting too much we may lose all.

A very pretty climber for the garden is Passiflora Pfordtii, a comparatively recent introduction. It produces its large and handsome flowers very freely during the Summer,

but is at its best in August and September. During the latter month, as the weather gets a little cool, it is no unusual thing for the flower to remain open two days, and sometimes even more. It is a good plant to grow wherever a place can be found for it. It does well also in the greenhouse, and is much easier to grow than those that require a strong heat.

The following extract from a letter from Mr. Downing will interest many: "The Cuthbert Raspberry appears at present the most profitable one for market. The Turner is also good; but to eat and for family use I have seen nothing to exceed Brinckle's Orange. Pride-of-the-Hudson is a fine sort if well cared for, and so is the old Franconia." I am somewhat inclined to go just one step further, and say that, to eat, I have never seen any raspberry to equal the Brinckle. If it were only hardy and strong, we might be content to wait a long time for another.

I have received for trial some plant labels made of very thin sheet-brass. They are cut into good shape, and pierced with an eyelet hole. I have not yet given them a sufficient trial, but a very hard pencil or a bodkin creases the name in a way that would seem to be durable. I shall refer to them again after further trial. Few things are more needed than a durable plant label that will carry an indelible name.

HORTICOLA.

[We beg to suggest that we don't want anything better than the common zinc labels, using a lead pencil to write the name. This, as we can show at the Rural Grounds, will remain perfectly distinct for—we know not how many years. EDS.]

The Vineyard.

THE CENTENNIAL GRAPE.

THIS grape is a seedling of the Eumelan, grafted upon an Iona root. It somewhat resembles the Delaware and the Catawba; but, being of a lighter color than either, it may be classed as a white grape with a pink cheek. It ripens about midway between these old favorites; keeps, when packed for winter use, as well as the Catawba; the skin being tough it does not crack or burst like the Delaware while ripening, and it is free from a loose, dangling shoulder. For quality of fruit it is conceded by all who have seen it to be quite equal to those old sorts. For both the table and for wine, it is superior to the Delaware in size of berry and cluster. It is also superior to the Catawba in earliness and quality, and superior to both of these old favorites in health of foliage or exemption from mildew. It will doubtless do well wherever the Eumelan now succeeds. Its reproductive organs are simply perfect; there are never any emasculated clusters and some of the fruit must be cut off to prevent overbearing. It has not been analyzed for grape sugar, but it is plain enough that it must rank near the Delaware, and it is as free from pulpiness.

As to hardiness, the vine seems much like its parent; the growth, however, is a little less rank and it ripens its wood earlier in the season. It is therefore very hardy, and propagates splendidly from cuttings. Having tested its great fruiting capacity and other characteristics since 1875, the first season of its bearing, I can truly say I am delighted with this grape. If it succeeds as well after testing in other localities as in this, it will probably prove to be our best native grape for the main crop upon our Atlantic seaboard.

The botanical class to which it belongs—Vitis æstivalis—has long been looked upon as the one from which our finest grapes must originate. There is some evidence in the appearance of the fruit, that it may be a hybrid with the Delaware. I used pollen for hybridizing from the Delaware and other vines upon the cluster from which it was propagated. If upon closer observation this should be determined, then its botanical classification would be one-fourth Labrusca and three-fourths Æstivalis. Growing seedlings from it will probably decide the question. It would not do to class it as a hybrid until I am sure of it.

I trust you may see in these grapes some confirmation of my theory, that grafting is an important factor in the process for breaking up prepotency and improving our native grapes; also that there is no necessity to endanger the health of our vines by hybridizing with foreign kinds to obtain quality of fruit.

Watertown, N. Y. DANIEL S. MARVIN.

REMARKS. The description of the Eumelan, it seems to us, applies quite well to the Centennial, so far as quality is concerned. The berries, however, are more crowded upon the bunch and not so large. The skin is strong; not one imperfection appearing in the several bunches received. Mr. Marvin sends us also several others of his seedlings which are certainly of excellent quality.

THE LADY WASHINGTON GRAPE.—Your spirited and truthful illustration of this promising grape reminds me that I have not reported its conduct in this part of Western New York, where we are not especially favored with those surroundings that conspire to make grape-growing eminently successful; where we hug the faithful old Concord, and caress novelties with a long pole, as though they were animals that might bite. I planted the Lady Washington one year ago last Spring. I cut away all the first season's growth but two buds, for propagation. These buds have made canes this season, measuring over twelve feet each. I gave no Winter protection, and only fair attention, and it is perfectly healthy and hardy thus far. With the treatment given I did not expect any fruit, yet two clusters appeared. I drew a heavy paper bag over each as soon as out of blossom, and did not remove them till the grapes were ripe. I exhibited one of the clusters at our Western New York fair recently—it was the only specimen shown. This is, indeed, a beautiful grape, early and good, yet not the best in quality. The cluster is compact, shouldered; berries irregular, often large. The reddish tinge apparent on some parts of the clusters adds much to their beauty. I am disposed to be hopeful on the subject of white grapes—yes, I may say that I am bordering on enthusiasm. Good white grapes that we can all grow and enjoy—why this has been our dream for years.

Clifton, N. Y. CHAS. A. GREEN.

Farm Economy.

FEEDING THE CORN CROP.

PROFESSOR E. W. STEWART.

INDIAN corn is the great crop of the United States. In 1879 the product was a round fifteen hundred millions of bushels, and its market value was estimated at $600,000,000; and we exported over 98,000,000 of bushels, amounting to $53,200,000. Most of these 98,000,000 bushels was used to grow meat in England and on the Continent. Had it been fed for the production of meat in this country, the meat product would have sold for $15,000,000 more than the corn, and we should have saved the fertility carried off. But we may congratulate ourselves that only a little more than six per cent. of the whole crop was sold, leaving 1,400,000,000 bushels for home consumption. If we are to suppose it all used to fatten cattle, and that 50 bushels will fatten a steer, it would take 28,000,000 cattle to consume it all. But immense quantities of corn are used for human food; for making corn sugar, starch, and in other manufactures; for growing pork and mutton and for feeding poultry. It thus has a great bearing upon the welfare of the whole people.

In all the older States much labor is bestowed upon this crop in husking, shelling, grinding, etc., for the use of animals. In the great corn States of the West, cattle are turned into the fields and allowed to do this work for themselves, wasting much corn, as Eastern farmers suppose; or it is shocked at maturity and afterwards carried to cattle in the fields. In both cases, the cattle are followed by hogs to pick up the waste corn. The most wasteful practice is turning cattle into the field—"hogging down" as it is called, for then the fodder is of little value; but if the corn is put in shock when the stalks are green and succulent, the fodder will have a value in nutriment of 75 per cent. of that of hay per weight when cured, and the grain will be equally valuable as when left till the stalks are nearly dry before cutting. This matter of shocking the crop of corn at the proper time will be seen to be of great consequence when it is understood that the fodder is worth, at least, $5 per acre more than when left till the leaves are dry and bleached and the rind of the stalk is more tough and woody.

AN IMPROVED METHOD OF FEEDING.

This article is written to call attention to an improved method of feeding the corn crop in all States whose corn is shocked and husked for cattle or sheep-feeding. The labor of husking, shelling and grinding may all be saved by the new method. In feeding corn from the shock to cattle a very large portion of the corn passes them whole, because it is not raised and remasticated. When corn, shelled or in the ear, is fed alone to cattle it is not raised and remasticated, for the kernels cannot be formed into a cud, and thus it passes on, and the broken corn is partly digested, but the whole corn is not acted upon by the gastric juice, and is expelled in its whole state. If this corn is mixed, when swallowed, with hay or other fibrous food, it will be raised and crushed in the remastication, so that the digesting fluid may act upon it.

The new plan is to render it necessary for the cattle to eat the grain and corn fodder together, and when thus mixed both are raised and remasticated together. This is accomplished by simply cutting the unhusked corn-stalks—ears and all—into very short pieces by running them through a large cutter and reducing the whole to fine chaff. Such a large cutter run by a sufficient power, will reduce into these thin shavings two tons per hour, costing less than simple husking. This breaks the rind of the stalk into fine shreds, shaving up the cobs, splitting most of the kernels, mixing the coarse and fine parts of the fodder together, rendering all soft and easily masticated—leaving no short edges to irritate the mouth as when cut one inch or more in length.

The reader will see the great improvement of this plan when he considers that it costs less labor than husking, as an acre of corn can be thus prepared for feeding in one hour with the aid of two men. This method also saves all the food there is in the crop, carrying out the plan of nature to feed the grain and stalk together—the bulky with the concentrated. This will also improve the health of the cattle as well as save a large percentage of food. This method also enables the feeder to compound the ration practically according to scientific principles. The entire corn crop—stalks and grain, in their best estate—is even too poor in albuminoids or flesh-forming substances to make a well-balanced ration alone. But if two pounds of linseed meal or cottonseed meal, be added for each steer per day, it will balance the constituents of the ration and fatten cattle more satisfactorily. Either of these oil-meals may usually be purchased at the mills for $20 per ton, so that this addition to the ration would cost only about two cents per day for each steer.

This plan is adapted to feeding on a large or small scale; but the greater the number of cattle, the less labor proportionally. It is adapted to feeding in a warm stable or in the open air. In the former case, the whole ration may be steamed or slightly fermented, or fed dry; and in the latter case it must be fed dry in troughs, because if steamed or moistened and fermented, it would freeze in the troughs. This plan is not theoretical but practical, the writer having put it in practice for several years. B. A. Avery, of Syracuse, N. Y., having fed 100 cows on this plan for six years, regards the corn crop, fed in this way, as valuable as if husked, shelled and ground into meal.

WESTERN NOTES.

B. F. JOHNSON.

Barbed Wire Fencing.

It having been assumed, because stock might injure themselves by accidentally or intentionally coming in contact with barbed wire fencing, that therefore the invention is a barbarous one and that its employment should be regulated by law or frowned down by public opinion, I have made some inquiries as to the facts in the case and with the result below.

The Illinois Central Railroad was the first company to make use of the barbed wire on an extensive scale, having begun putting it up three years ago. On the Chicago branch, extending 365 miles, between Chicago and Cairo, some 65 miles have been built, and a responsible officer of the company informed me he had heard of no complaints from farmers, and he was in a position to know of them, if they were made. On the Springfield division, where this fence is now used nearly exclusively, the road-master informed me he knew of but a single accident happening on account of it, and that to a stray mule hastening home in the night, and not informed of the existence of the new-fashioned barrier. Horses which feed and wander about in the night, sometimes run on the fence unawares, and get scratched, but never a second time. Mules are rarely hurt, and cattle seldom or never. When an old board fence is torn away, or a rail fence removed, and the barbed wire is put up in its place, when it is finished and the men leave, cattle approach in a body; examine the new contrivance closely; smell of it; "study" a while over the matter; then apparently make up their minds it won't hurt them if they don't trouble it, and quietly return to their grazing. Of its effectiveness against breachy cattle, the road-master relates an instance where, near Weedman Station in DeWitt County, a large lot of feeding steers were pasturing against a half mile or more of common plank or board fence, which some of them broke through, and got upon the track nearly every day. The usual barbed wire fence was put up, which the mischievous steers came up to and examined as soon as the men had left; took in the situation as above, shook their heads, tossed their horns, moved off in a body and have never broken or attempted to break through since.

The first wire fence put up by the Illinois Central Railroad consisted of five strands, three barbed and two plain, viz. the second and the fourth. But this was found to be a mistake, and five strands, all barbed, are now the rule. Other railroad lines are adopting it as fast as old fences decay, and soon the railroads will be fenced with nothing else. On the Illinois Central Railroad which uses the best material, the cost has been reduced to below 82@85c the rod, divided as follows:

5 barbed wires—5 lbs	58c
1 7-foot white cedar post	11c
Building, staples, rails and braces	14c
	83c

Of course, no account is made of freightage on material which, for a fence equally good, would make the cost to the farmer from two to five cents more, according to location.

When to Dig Potatoes

is a question brought quite prominently forward at this time. For this latitude, the experience of twenty years in my case decides they should remain in the ground; for the early ones, until late in October, because they are safer there than anywhere else; as for the late ones, they are seldom fully ripe before that time. When dug in September or early in October, we almost always have a warm, moist spell of weather, in which early potatoes stored in quantity will surely heat and sprout, and sometimes rot. If spread out, they shrink; and if exposed to the light, they become green; and if piled or buried, they heat. In the South potatoes must be dug soon after they mature, or the heat destroys them; in the North I can conceive that they will rot if left in the ground—South they are apt to spoil out of it, demonstrating that there is nothing absolute in agriculture, and that what may be good practice in one section may be bad in another.

Onions on the Prairie.

Those who imagine the prairies are restricted to a few special crops and know nothing of diversified farming beyond corn and grass, wheat and oats, sheep, horses, hogs and cattle, will scarcely credit the statement that for the onion crop, a Timothy or Blue Grass sod, when handled by those familiar with the fragrant esculent, produces yields of onions of superior excellence as to amount and quality. The land usually chosen is moist and at the same time with good natural drainage, conditions which insure a strong, deep soil, capable of producing 50 to 60 bushels of corn per acre. The sod is turned early in the Spring, or, better, late in the Fall, and the surface is fined by repeated goings over with a sharp-toothed harrow, a week or two before seeding. Some time in March or early in April, the seed is sown by a drill, at the rate of five pounds per acre, the rows being 16 inches apart, and, when weeded, the plants stand from three to four inches in the row. Sod is preferred because it is free from weeds, and manure is not used because it fouls the land, and the cultivators generally have not come to understand the value of special fertilizers for onions. The stand generally, on which everything in an onion crop depends, was not very good this year; but otherwise the season was favorable, the drought doing little or no damage. The yield is from 200 to 300 bushels per acre, and the price realized $1 per bushel by the quantity. The onions of this year's crop are smooth, round, solid and large, not over-grown, or inclined to draw up and become *scullions*. But it is estimated an acre of onions demands as much labor as 40 acres of Indian corn.

The Rural's Estimate of Clawson Wheat

is the general estimate of this country. It is the wheat for poor land and careless farming; for much starch and more bran; but not for rich soils and intensive agriculture. But, then, if Clawson should be grown for any considerable number of years on the strong wheat soils of the Western winter-wheat belt, it would soon begin to, and ultimately change its character. The outer pellicle would grow thinner, the amount of bran diminish, the starch change into gluten, the form of the grain lengthen, its consistence grow harder; in fine, the Clawson would no longer be Clawson, but something improved and refined. Poor soils not only grow wheat in small quantity but poor in quality. Strong, rich soils produce, not the largest crops, but those of the best kind of grain, while the very largest crops are generally produced when such wheats as the Fultz and the Clawson, originating on worn soils, are transferred to strong and rich but not too rich lands.

The Texas Cattle Fever

is said to be prevailing to an alarming extent in some portions of Kansas. It has also broken out and carried off town cows and straying cattle in Missouri and Illinois, which, feeding about the railroad stock pens, came in contact with the *virus* lodged where Texas cattle have been loaded and unloaded, and fed and watered. The cars, too, in which Texas cattle are conveyed, are said to be sources of infection. It is quite evident some general law governing the transportation of cattle should be enacted by Congress as soon as may be.

Hereford Cattle.

Mr. A. B. Allen is right when he speaks of a strong rivalry as likely to arise between the Herefords and the Short-horns for the stocking of the Western plains. It is possible a rivalry, too, may arise near home, when a

time comes, if it is not now here, when a steer is wanted which will lay on fat and flesh enough on grass alone, between the first of May and the first of November, to make number one beef, without the aid of corn. One or two years' feeding on corn, when corn is worth about 30 cents the bushel, is apt to result unprofitably, and feeders are finding it out, and coming to rely on grass more. The Herefords, Mr. A. has examined were no doubt open to this objection, "that they are apt to drop from the "huckle-bones to the tail, and here and in "the hind-quarters, they are not generally "equal to the Short-horns," but I think if he had seen some of the best Herefords of Mr. Culberstone's herd, exhibited at the Illinois State Fair, he would correct his estimate, at least so far as hind-quarters are concerned, and especially in the case of the bull at the head of Mr. C.'s herd, which was remarkably good on that point. But the rivalry in breeding is not confined to beef cattle. It has invaded horsemen, and a strong rivalry is already showing itself between the Normans and the Clydesdales, in the matter of draft horses. Within ten years the Clydes have been increasing in popularity, but something like a rage is being developed for them now, of which nobody can anticipate the outcome.

Dairy Husbandry.

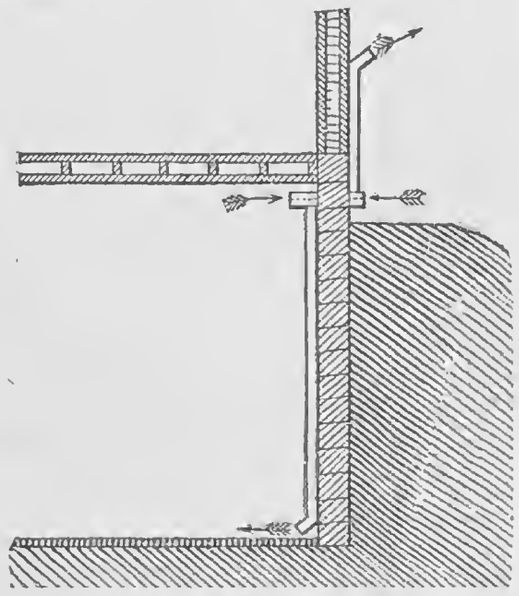
THE DAIRY COW—NO. 12.

HENRY STEWART.

MILK-CELLARS.

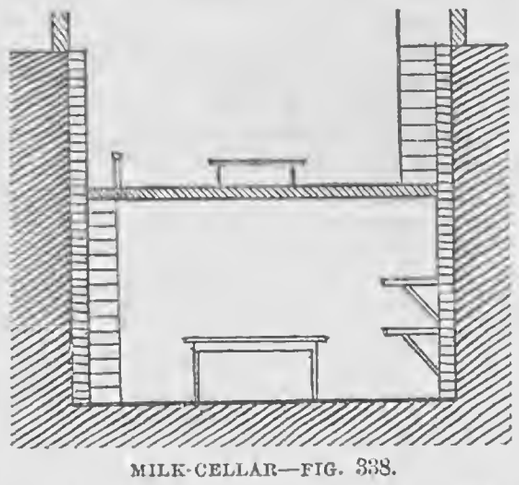
No dairy is well furnished unless it is provided with a good milk-house. The quality of the butter made depends greatly upon this, and even if the best appliances—such as have been described—are used, their convenience and economy are in proportion to the good or bad arrangement of the milk-house.

The first requisite of a milk-house is evenness of temperature. In a building that is not cooled by ice or warmed by a stove, the most regular temperature is secured in a cellar. The common receptacle for milk is a cellar, because every house is supplied with one, or should be, and it is the most convenient place for it. For a family dairy the cellar will be the appropriate place for keeping milk; and if it is not fit for this particular purpose, which requires absolute cleanliness and purity, it is not fit for human beings to live over. If it is not fit for this purpose, it should be made fit by thorough cleansing, and draining, if necessary; laying a floor of cement, moderate lighting and ventilation, and the protection of the windows by wire gauze. A slatted outside door is very suitable for a milk-cellar, and this should be on the north side and opened at night. The walls should be closely pointed and whitewashed inside. The common practice of protecting a cellar from frost by heaping litter from the stable around it, is very objectionable. Nor should turnips or potatoes be stored in a cellar in which milk is kept, unless it is divided by a tight partition and the root cellar abundantly ventilated.



MILK-CELLAR—FIG. 337.

Ventilation for a cellar may be provided by carrying a tube or spout from the floor to the ceiling, and through the wall out of doors where it should be protected by fine wire gauze. The arrangement is explained in the illustration, in which the cellar wall is shown with the spout fixed against it. The outlet is divided in the center, and one half communicates with the spout which reaches to the bottom of the cellar, and this furnishes an inlet to fresh, cold air. The other is connected with the short upright spout outside, through which the warm, fouled air escapes, as shown by the arrows. This arrangement has been found very useful both for purifying and drying the air of a cellar; for the cold air coming in at the bottom is drier than the warm air passing out, and the moisture of the cellar is continually absorbed and carried off so long as any warm air flows out of the upper spout. The spouts are provided with slides by which they are closed when it is necessary. The cellar should be well ceiled with lath and plaster, otherwise dust will be dropping from the rooms above; and in any case this is advisable, for if no other means of ventilation are provided, air will pass up and down through the floor over the cellar and it may be bad for the milk, and for the occupants of the rooms above as well. The ceiling not only preserves cleanliness, but regularity of temperature at the same time.



MILK-CELLAR—FIG. 338.

In the Southern and some Western States the houses are not provided with cellars. Where an outside cellar is desirable, in these and other cases, an excellent arrangement is as follows: See illustration. A cellar is dug 12 feet deep; the walls are built of stone, concrete or brick. A sub-cellar at least eight feet deep, is made by throwing a floor over the cellar four feet below the surface. An outhouse or shed is built over this as a protection and is lighted by a sash in the roof. A sash is placed over a raised frame in the floor, as shown, which lights the sub-cellar. Steps are provided for access to each cellar. The sub-cellar is furnished with shelves and a bench and in such dry soils as will admit of it, a cellar of this kind is one of the best possible for a small dairy or, indeed, for household purposes. It is light and cool and the temperature will not vary from about 60 degrees, or somewhat less, the whole year. It should be kept whitewashed, by which the light is well diffused about it. It may be found convenient to use the upper portion as a churning room and for storing milk utensils.

Cellars are apt to be damp. In this case the air may be dried by means of a peck of fresh lime placed in a box or tub in the cellar. Twenty pounds of lime (one peck) will absorb about seven pounds of water, and to take seven pints of water from the air of a cellar will make it very dry. The lime will simply fall to a powder and may be then used for many useful purposes, or be added to the garden compost heap.

Where the cellar cannot be used on account of the wetness of the soil, an above-ground cellar must be provided. This may be partly sunk in the ground, but if there is any danger of water soaking into it, it should be wholly above the ground. It becomes then, properly, a milk-house, and the description of such a house will be undertaken in the next chapter.

WAUPACA CO., WIS., DAIRYING.

This county lies just south of the latitude of Green Bay. It is intersected by the Wisconsin Central Railway and the Milwaukee, Lake Shore, Western and Green Bay and Minnesota Railways and by Wolf River which is navigated by steamboats. It is just now in a state of transition from lumbering to agriculture. The soil is greatly diversified; there are tracts of sandy land, well dotted with pine stumps, of little seeming value, yet being fast settled by foreigners who seem to thrive where Americans would starve. There is also a large extent of oak openings, varying from sandy to clay loam, but for the most part the country is very good farming land yielding fine crops of clover, corn, potatoes, rye, etc. There are also large tracts of strong, fertile, loamy land originally covered by a heavy growth of oak, maple, basswood, ash, ironwood, butternut, hickory, etc., that produce excellent crops of the cereals and grasses, and seem to possess a permanent fertility.

Blue Grass, White Clover and Red Top are indigenous to the land and to the oak openings. These grasses form a perfect sward and grow so luxuriantly as to exclude weeds. It is doubtful if our pastures will need renewing for a life-time, some of them having steadily improved in quality and yield for a term of years.

Mr. L. Hayward, of Royalton in this county, informed me that he had mowed the same meadow fifteen years successively, and still had good crops. Many of our farmers have undertaken to compete with the prairies in the production of grain, wool and meats. Beaten and disheartened in this unequal struggle, they long to join the rush for Dakota or Kansas, and their farms can usually be bought at about the cost of the improvements. Others of keener discernment and many from the dairy regions of New York and New England, have discovered that in soil, grasses, waters climate and abundance of fuel and building materials, Fox River Valley is as unrivaled for the dairying interest as for its water power and manufacturing adaptability. These men have built up our creameries and cheese factories which have already won sweepstakes on butter and cheese at some great fairs. I need only add that the prices of feed per ton are:—bran, from $6 to $10; middlings, $7 to $14; corn-meal, $13 to $18. It would not surprise me to see, at an early date, an exodus of Eastern dairymen from their worn-out farms and moss-grown pastures settling upon these virgin soils, and rejoicing in the good things that nature's God has so richly deposited in this favored region. T. W. R.

Weyauwega.

Sheep Husbandry.

ROCKY AND PARTIALLY BARREN LANDS FOR SHEEP PASTURES.

There are millions of acres of such lands in the United States and Territories, and where it is not more profitable to keep them in forest, they may be utilized as pastures for the support of sheep. They ought to be owned in tracts sufficiently extensive to maintain flocks large enough to afford keeping a shepherd, with trained dogs to attend them constantly Two or three of these dogs for his companions, make it an easy task for a single man to handle a large flock, and keep any from straying or getting lost; and they are a protection to the sheep from vicious dogs by day and night, as they invariably attack and drive off any such that approach.

Sheep may be pastured here in Summer, and then be sold off or taken to better lands to Winter. But it frequently happens that narrow valleys are found winding between rocky hills, sufficiently fertile and free from stones to be easily cultivated for various crops. Where this is the case, the English system may be pursued of sending the sheep on to the hills for pasture during the day, and hurdling them on the growing crops in the valleys at night; or these may be cut and soiled to them in racks, if preferable. A succession of crops must be cultivated for this purpose, commencing in the Spring with rye; and continuing during Summer and Autumn with other products, which are too well known to our readers to require enumerating here. Folding the sheep at night on these, enriches the land adequately to bear good crops the ensuing year, and thus it may continue to be cultivated indefinitely.

In England these soiling crops are inclosed with shifting hurdles, in squares of about an acre each, and the sheep, when driven down from the hills at night, are divided into bands of 100 or so, and each band folded on to a separate division. An acre of clover usually feeds 100 sheep during the early evenings and mornings for a week, and other crops do the same in proportion. No better preparation can be made there for a succeeding wheat crop than this, if it be ever desired to grow one.

In such a system of sheep pasturing and soiling, they can be made sufficiently fat for market to be drawn from early in Summer, and thus continue on for repeated drafts till cold weather sets in. If the valleys are large enough, forage can be raised there, not only to fatten off all the sheep desired from the flocks, but also to winter over what is required for breeding and store purposes the following season. This is one of the most easy and profitable systems of farming that can be followed in our country, and it only requires to be duly considered by flock-masters, to induce them to adopt it as rapidly and extensively as cheap lands can be obtained.

Sheep for such lands should be of medium size, compact form, early to mature, hardy and active. The South-Down breed, or its high crosses are usually adapted for this system of feeding and fattening in England, and we think they would be the most suitable breed for American flock-masters. Richer, smoother, and more level lands are better adapted for the larger Down breeds, and particularly for that of the Oxford, the biggest of all. Still richer lands and more abundant feed are requisite for the Cotswold, the Lincoln, the Leicester, and other long-wooled breeds, as they excel in size, and are not so active to range in pastures and work for a living.

The Herdsman.

HEREFORD CATTLE.

In my article in the Rural of the 2d inst., it escaped me to say that there have been repeated importations of Herefords for years past into the State of Maine, where from their large size, great muscular power, hardiness and endurance, the pure-bred and even grade oxen are in high favor for general farm work, and more especially for lumbering. The forest trees of Maine are of extra girth and hight turning out the heaviest class of logs. It consequently requires extra-powerful oxen to haul these to the river banks, to be floated down to a market on the breaking up of the ice in Spring. Nothing is superior to the Hereford for this purpose; and although the loaded sleds may glide easily over the compact, snowy paths, still it requires a *big team* and a *strong one* to bank the formidable sticks of timber which the forests of Maine have grown up so profusely.

After working the oxen till they are seven to nine years old, they are usually turned out to a rich grass pasture in June, to fatten during the Summer, they being admirable grass-feeding beasts. In Autumn they are either sold for slaughter, or taken up and stall-fed a while, and then sold during the Winter for the same purpose. The flesh laid on during this time, being nearly all new, is as tender, sweet and juicy as that in the two to three-year-old steers at the West, which have been well fed from birth and never worked in the yoke. Herefords and their crosses are also used to some extent as working oxen, and for fattening in some of the New Hampshire, Vermont and Massachusetts districts and are found among the most profitable and valuable of cattle. A. B. Allen.

THE GOAT IN ENGLAND.

The English people of fashion have taken up the goat; an animal proverbially significative of general wickedness. They have labored long and arduously to make it popular as a dairy animal and as a substitute for the gentler sheep for the production of mutton and lamb. With this intent the British Goat Society recently held the first of a series of kid dinners at the Alexandra Palace. One hundred and thirty-two members have enrolled themselves as admirers, supporters and defenders of the British goat. Earls, dukes, baronets, and one baroness, an estimable lady whose name—Burdett-Coutts—is connected with every charitable and philanthropic purpose, are numbered among the vice-presidents. This ought to give the British goat social standing at once, and easily reconcile an irate housekeeper who has detected the hair on the shank of her last quarter of lamb, to this delinquency of her roguish butcher. Fifty distinguished persons sat down to eat goat and kid prepared by a skillful *chef-de-cuisine*. Swiss scenery with pictures of mountain goats, adorned the bill of fare; and on the whole the banquet was considered as settling all doubts as to the beauty and excellence of the goat not only as a source of mutton and lamb, but also of milk and butter; for all these helped to furnish the *menu*.

A British Goat Herd Book is already established, and goat exhibitions are held and well patronized, as, of course, they would be when earls and dukes are exhibited at the same time. Here in America the way of the goat is hard. He is despised and rejected, and is a subject of derision to the small boys, and a source of trouble and annoyance to the poster of handbills, not to speak of his raids upon the properties of the laundry-women whose lighter articles of attire so soon become the prey of his uncontrollable appetite. Not even the high-bred Angora can hold his own in this country; and the farmer who has been rash enough to purchase a pair, "to get into the stock," is tired of climbing on to his barn roof to gather them in from their elevated roosts every evening.

It is all in association. The present low and vulgar tastes of the American goat, prevent his rise in society, and as we have no earls or dukes here to introduce him to high life, there seems to be no encouragement to hope for his recovery from his present depraved and despised condition.

Industrial Societies.

THE TRUTH ABOUT IT.

[The object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—Eds.]

PROFESSIONAL EXHIBITORS.

"Hippodroming" is known as the practice of carrying around a herd or flock got up for show, to take premiums at agricultural fairs. It is an objectionable practice. It is a foreign and imported fashion and is falling into well-deserved disrepute in its own home. The English people are setting their faces against it, and the judges of some of the prominent exhibitions are instructed to pass over those animals which are fed, fattened, shorn, shaved, trimmed and otherwise prepared to catch the popular eye and sweep away the premiums from more useful and deserving cattle.

A notable example occured at the recent international sheep exhibition at Philadelphia. A noted dealer in cattle imported a number of sheep, which had taken first premiums at English shows, for the purpose of exhibiting them

at our fairs. These sheep arrived just in season to begin their starring tour at Philadelphia. Here they won $2,660 in premiums. There was never a sum of money more uselessly or worse bestowed. These exhibitions are intended, or so declared to be, for the encouragement of agriculture. In what sense is agriculture encouraged by an exhibition of animals which are simply monstrosities of fat, and which are so debilitated by the injurious feeding as to be incapacitated for the only purpose which they are supposed to be intended for, namely, breeding? It is safe to say that these particular animals are useless for that purpose. They cannot be kept up in the condition in which they appear at the fairs without soon reaching the inevitable result of the overfeeding to which they have been subjected. These animals are jealously guarded, lest some inquiring farmer, intent upon getting the worth of his money in valuable information, might disturb the rest of these pampered lumps of fat. "Do not touch or disturb the animals" is conspicuously enjoined upon the visitors by means of a large card, in the manner of the menagerie, where one is particularly requested not to stir up the monkeys or to look at the elephant too closely.

The truth of this is, that it is not agriculture; it is show business; and ought to be severely reprobated as a waste of money and a gross diversion of it from its legitimate uses. It is the introduction of side-shows, no more relevant to the business in hand than the exhibition of "the fat woman," and "Barnum's Great American Giantess," eight feet high, 13 feet round, and who weighs 640 pounds." So these sheep are considered in proportion to their weight, and weighing 340 pounds each by dint of cramming with oil-cake and corn, they take the ribbons from the more really worthy and in every way valuable sheep weighing a hundred pounds less. The last accounts of this flock are that they are now starring it at St. Louis, and are engaged to appear wherever the money premiums offer sufficient inducement.

The owner, who has had no hand or work in getting up these sheep, will probably receive in premiums more than their cost and then dispose of them to some deluded fancy farmer who can "point with pride" to his prize animals, which cost—so much. And the exhibitor retires on his laurels and his greenbacks, and laughs in his sleeve and thinks the fool-killer missed a good many whom he ought to have looked after, and about this time next year he will be on hand to repeat his annual performance.

No wonder that the plain, sensible farmer is "down" upon agricultural exhibitions, and finds solace in studying agriculture around the trotting course, where more excitement can be had for his 50 cents, than in front of such disheartening and disappointing "studies" in his art as these show animals, useless for any good purpose, and only intended for taking premiums which they don't deserve. H.

NEBRASKA STATE FAIR.

(Rural Special Report.)

THE Nebraska State Fair for 1880 was held at Omaha last week. The Omaha people, in the excess of that liberality and enterprise for which they have ever been characterized, fitted up forty acres of ground in a most magnificent style, at a cost of about $25,000. Everything was new, put up substantially and permanently, to be used hereafter as State exposition grounds. The halls were large, of modern architecture, well lighted and ventilated; stables, stalls and stock pens were of the very best, arranged to be totally closed in case of inclement weather. At this fair, however, it was propitious, and the attendance large. On the principal days from 20,000 to 25,000 people were on the ground.

The annual address was delivered by Judge J. W. Savage, and was a masterly, practical effort in all respects. The Judge is a practical Western man, having had long experience in this part of the country, and, consequently, he knows of what to talk and how to say it. The State Horticultural Society holds its annual fruit exhibition in connection with the fair under the auspices of the State Board of Agriculture. In fact, the two are one and the same. The exhibition, as a whole, was the best ever held in the State, and in all respects it was a grand success. The fruit show was not so extensive as at other times heretofore. Omaha is not situated in the best fruit region of the State, and, besides, except for apples and grapes, this has not been a fruit year in Nebraska. Washington County, the next north from Omaha, where much attention has been given to fruit culture, was well represented on this occasion. E. N. Grennell and Hiram Craig, two veterans, had on exhibition about 500 plates of fruit of various sorts—principally apples and grapes. Mr. Hubbard, of Fredonia, in your State, had on exhibition specimens of his new white grape, "Prentiss," which attracted universal attention, and to which was awarded the first premium as the best new seedling on exhibition.

The farm-product feature, while fine as to quality, was not as extensive as we desired. *Horse trots* draw crowds and swell gate receipts, 'tis true; but they do not increase, in my opinion, the exhibits of soil products. The "trot" feature gave more satisfaction this season with us than ever before. Heretofore they have been *clean steals*. This year they may be called "middling to fair" in this respect. We secured the services of honorable non-resident gentlemen in the judges' stand.

Cattle, horses, hogs, sheep, poultry and implements were shown in greatly increased numbers, and of greater excellence than heretofore. Cattle, hogs and sheep are now leading factors in the industries and products of the not-long-ago "Great American Desert."

People never before left our fair grounds in such good humor and with such universal commendations.

Can't the RURAL come to see us next year?

ROB'T W. FURNAS.

[The RURAL would be very glad to do so. Eds.]

Miscellaneous.

BRIEFLETS.

S. B. PECK writes us that those who are fond of ornamental climbing plants will find the Chinese Yam (Dioscorea batatas) to their taste; and the curious in vegetation will be gratified by digging up the ground tubers at the end of the second year. . . . . The British harvest, after all the fuss about it, will prove a fair average. . . . . The Japanese government, it appears, has determined to establish fifty farms for the particular purpose of breeding cattle and sheep, and it intends after a while to establish others more strictly agricultural. . . . . We beg to state that those of our readers who intend to subscribe for the Inter-Ocean, Free Press, etc., in connection with the RURAL NEW-YORKER, may rest assured that we shall forward such subscriptions without the least delay. It is a matter of pride with us to wish to secure more subscriptions for them than they secure for us. . . . . Mr. D. S. Marvin, who has sent us a box of his seedling grapes, says: "Can Mr. Ricketts show anything among his hybrids superior to them. They are purely native. The 'Centennial' is in my judgment the best native grape we have for the main crop, and I hope to live to show you further improvements." . . . . The Philadelphia Herald says that as the coming frosts will soon ripen the nut crop every newspaper should warn its readers against eating chestnuts in the dark. It is not only unwise, but it is cruelty to insects. . . "Black-bearded Centennial" wheat. Who has it for sale? . . . . The Norristown Herald, referring to the duel which recently took place between a Ute Indian and a Navajo, in which the former was killed and the latter seriously injured, remarks. "This is very sad. When the untutored child of the forest becomes civilized and adopts the ennobling pursuits of the Christian pale-face, he can fight duels all day without anybody getting hurt." . . . . Xanthoceros sorbifolia which, several years ago, we had much to say about, may be propagated by root cuttings, Mr. Meehan says. . . . . Hyacinths and tulips for Winter flowering should be potted at once or placed in glasses of water at once. Set them in a darkened, cool place until the roots are well developed, then give them light and warmth. . . . . We are surprised that Mr. Meehan does not know that "pindars" is one of the local names for—for Arachis hypogæa—*sometimes* called peanuts! . . . . Speaking of Mr. Meehan reminds us that Dr. Gray has named a beautiful new stone-crop, Sedum Meehani, thus connecting his name with the botany of the country which he has worked hard to illustrate. . . . . It will appear from the following that our estimate of Fay's Prolific Currant illustrated and described in the RURAL NEW-YORKER of Sept. 18, is well supported. Mr. Downing says: "They are very large and showy. As to 'Fay's Prolific,' judging from the branch you sent me, it indicates the most prolific bearer I have seen. The strings or clusters are very long and hold their size well in proportion to the end. The clusters are much larger and longer than those of the Cherry Currant." And Marshall P. Wilder says: "I infer that the variety was raised from the Cherry Currant. If so, the bunches are longer and the bearing qualities of the tree seem to be greater and the flavor of the fruit in advance of that of its parent." . . . . In the suit of The Pope Manufacturing Company, of Boston, against McKee and Harrington, of New York City, for infringement of the patents belonging to said Company, relating to bicycles and velocipedes, the Court has ordered an injunction to issue against McKee and Harrington for their infringement of said patents, restraining them from manufacturing or selling bicycles. This decision seems to settle the question as to the validity of the patents controlled by the Pope Company, giving it the sole control of the manufacture and sales of all bicycles or velocipedes now in common use. . . . . The A. & M. College of Texas opens with nearly 100 students and every indication promises a prosperous session. Success to this college and to its Professor of Agriculture, who furnishes the above note. . . . . .

A Cheap Well.

Dig down to a depth of five or six feet a hole four feet in diameter; brick it up—using water-lime mortar. Below this dig your well in diameter a little less than the bricked top, and as you go down plaster the dirt or sand on the sides with water-lime mortar. A well dug and plastered in this way costs one-half the price of an ordinary well of the same depth and diameter, and is proof against all kinds of vermin, nor can any dirt wash down from the sides. I have a well made in this way, that has done excellent service for eleven years, and in that time it has been cleaned out only once. There is no need of cleaning such a well, as there is no accumulation of filth in it. The bricking at the top is done to avoid injury from frost, as the plaster peels off where the ground behind it has frozen. G. W. T.

Otsego, Wis.

THE BLACK RAT.—A "Subscriber" writes us from Victoria, British Columbia, that a black rat, smaller and much more timid than the Norway rat, is common in the sparsely populated country districts of Vancouver's Island, although in the towns and more thickly settled sections the Norway rat only is found.

WHAT OTHERS SAY.

THE BOY ON THE FARM.—From a thoughtful, interesting leading article in the N. Y. Tribune, by Charles A. Green, we take the following:

"Our homestead farm was one of the best in New York State, located on an eminence commanding views of great beauty, surrounded by friendly and intelligent neighbors, adjacent to attractive villages, churches, and schools. My father possessed liberal views of life, and we all indulged in luxuries in common with those out of debt, and with something in the bank. My brothers and I were given opportunities for recreation, education and private enterprise. While yet a lad I leased the homestead for two years, during which term, prices ruling high, I cleared over $2,000 above all farm or personal expenditures. Notwithstanding such favorable circumstances, often cited as a recipe for making boys "stick," none of my father's children continued farmers. With a fair prospect of ultimately owning the homestead, I left it, served an apprenticeship, and for twelve years was a banker in a city. There I learned how easily fortunes are made, and how easily lost. Learned the value of good digestion, and of the refreshing sleep of him who labors under the open sky. Learned, when clouds threatened, when the waves of the panic shook my bark, and the sea was strewn with wrecks, that the farm was a safe harbor, and I longed to cast anchor again in that quiet retreat, remembering only the pleasant chapters of my farm life. Do I then regret having left the old homestead? No, for there discontent would have relaxed my energies. No, for I cannot help feeling that I am a stronger man than I could have been had I remained. The principal cause of the discontent of the boys on the farm is this: Many of them were designed by the Almighty for specialties; are endowed with qualifications for mechanics, navigators, inventors, lawyers, doctors, clergymen, etc.

What a wonderful provision that all are not born for one pursuit. What confusion and suffering would result were it otherwise. Knowing well the characteristics of my brothers and schoolmates, who did not "stick to the farm," I am confident they would have made poor farmers, whereas in their proper spheres they were successful. Therefore I dispute the popular theory that we may advance agriculture by inducing those boys to remain farmers whose natural inclinations would lead them into other pursuits. Neither can I concede that the best boys leave the farm. There is much in agriculture that may allure men of ability to pursue it, and many of our best balanced minds are thus engaged. If the brother who follows a specialty carves a more brilliant record, it is in part for the reason that he beats continuously in the same channel, like the tireless Niagara. A man struggling for success in a field wholly unsuited to his tastes and natural endowments is pitiable, and often ridiculous. Who would thrust a child into such bondage? The discovery of our proper place in life being half the battle, let us make farm homes attractive to the boys, but for a nobler purpose than to induce them to remain against their better judgment. There is no famine in the land; our farms are occupied; the granaries of the world are overflowing. There is room, however, for a few more Fultons, Morses, Downings, Websters, and Lincolns. My experience with farm and city life teaches the wisdom of giving the boy on the farm opportunities for travel and thorough education. If then he chooses farm life he will make the better farmer, and more useful and honored citizen."

THE AVERAGE YIELD OF CORN, says the N. Y. Times, is less than half of the possible yield. When one thinks how little the second half of 100 bushels of corn per acre costs, the profit of growing such a crop becomes apparent. And it is easy to produce such a yield. One wants the right kind of corn, the right fertilizers and manner of applying these, and a little extra work in cultivation. The cost of the land and of planting and tending the crop is the same for 20 bushels as for 100 on an acre.

BLOUNT AND CHESTER AT THE RURAL FARM.—The above article goes on to state that the present season the Editor of the RURAL NEW-YORKER, on its Experimental Farm on Long Island, has grown, in field culture, more than one hundred and fifty bushels per acre of shelled grain of Blount Corn, and over 300 bushels of ears per acre of Chester County Mammoth Corn. The fertilizer used has been at the rate of 500 pounds per acre; 300 pounds used before planting; 100 pounds when the corn was six inches high, and 100 pounds when it was two feet. It is easy to figure up the cost of a bushel of corn thus grown, with the fertilizer at $10 per acre, at less than 20 cents a bushels for the grain, leaving the fodder out. If all this is true, and if it may be applied to other crops as well as corn, what becomes of the complaint that farming does not pay?

[The Chester Mammoth field received but 350 pounds of fertilizer applied all at one time, viz., before planting. Eds.]

A GREAT ORCHARD.—The Farmer's Review publishes a detailed account of the orchard of A. R. Whitney, of Illinois, who has 155 acres in apple trees. He set the first 400 trees in 1843, and now has 16,000 in bearing. He began with 144 sorts, though only 30 are left, his object being to test them. For Summer and Autumn, he chooses Red Astrachan, Maiden's Blush, Snow and Bailey's Sweet, and for Winter and Spring, Domine, Jonathan, Willow Twig, Ben Davis and Winesap. His largest crop, in 1876, was 26,000 bushels, one-half of which was shipped to market, and the other half made into cider. He does not count on a full or heavy crop oftener than once in four years. For the codling moth he turns sheep into the orchard, by which these insects are nearly cleared out. The long-wool sheep are best, as Cotswolds, Leicesters and South-Downs; Merinos eat the bark. The soil of the orchard is rich enough without manure. Mr. W. advises for an orchard that it slope to the north, cultivation with corn for a few years, then seeding to clover, to be plowed under every three or four years.

MARVEL OF PERU.—"Is it worth growing?" was the question put some time ago in reference to this fine and useful old flower, and the answer given was, "Oh, ingrate world, to ask such a question. Look into the tiny front court of the cottager in the cool of the day, and be struck dumb with astonishment at the scintillating beauty of the great, round, dense bushes clothed with bright light-green shining leaves, and pink, white, scarlet, purple, or rosy flowers that truly glitter, as if blessed with a better sort of daylight than the grand plants that swelter in my lord's garden." In such forcible terms has Mr. Shirley Hibberd placed on record his impression of this old American herbaceous perennial, introduced from South America as far back as 1596 or thereabouts.

ORIGIN OF BREEDS OF CATTLE.—Prof. Sheldon of England in a lecture says: "We are not in a position to state how it came to pass in one country, that two such diverse races of cattle as the Long-horns and the Short-horns, should have been evolved. But whatever may have been the process of crossing the breeds, whether designed or not, this one thing is clear—viz., that while the Long-horns were produced in the district of Craven, a fertile corner in the West Riding of Yorkshire, bordering on Lancashire, the Short-horns sprang up in the Tees-water district, on the other side of the same county. We may venture to assume that the marked distinctions between these two famous breeds of cattle are owing, in the first place, to the proportions in which the ancient blood became intermixed; and, in the next, to the soil and climate of the districts severally. In the one it is reasonable to suppose the blood of the Bos urus predominated; in the other that of the Bos longifrons. The rest is owing to the influence of locality and to the control of man. Of the other great breeds—the Herefords, the Devons, the Sussex, the Jerseys, the

Ayrshires, the Polled breeds of Scotland and England, the Welsh breeds, the West Highlanders, and the Kerrys—we can speak no more definitely, and we must be content to assume that to natural and artificial selection, coupled with the influence of climate, of soil, and of herbage, are attributable the diversities of character in our breeds of cattle, which are at once so interesting and so marked.

EARLY PANSIES AND VIOLETS.—Few things are more valued in Winter than a bunch of Sweet Violets says Prof. Meehan. A few may now be potted, and they will flower in the window towards Spring; or a small bed of them may be made in a frame, which should be protected by a mat from severe frost. To have pansies flower early and profusely in Spring, they may be planted out in a frame, as recommended for the violet.

THE BEST ROSE.—In France recently they tried to find out what was the best rose by vote. La France had 79 votes, while Marie Van Houtte had but 25. The old La Reine had 42, and General Jacqueminot 52. These votes are like our fruit votes. The one which is the most extensively grown will get the most votes, because half the voters do not know of many other kinds.

"LA FRANCE" ROSE.—Here in Rochester, says Mr. Hooker, in the Gardener's Monthly, the La France Rose is proving itself worthy of its name and fame. Nothing can excel it in beautiful, delicate color, exquisite and abundant perfume, and profuse, constant blooming from the commencement to the close of vegetation; just as long as growth is maintained, beautiful bloom will follow; in fact, the habit of overflowering is its principal drawback.

MOSS MULCHING.—For want of a better name Mr. Peter Henderson has given this to a practice that he has recently introduced into his greenhouse department. Some time about the first of January of this year, one of his young men suggested mulching with moss (sphagnum) a lot of roses, grown in seven-inch pots, that had become somewhat exhausted by being forced for flowers for the holidays. Believing the idea to be a good one he at once had a lot of nearly 3,000 plants so mulched, mixing, however, with the moss, a good portion of bone dust, perhaps one part by weight of bone dust, to thirty parts of moss. In two weeks the effect began to be easily perceived on all the roses that had been so mulched, and without shifting they were carried through until May with the most satisfactory results, many of the plants having by that time attained a hight of from four to five feet, and though they had bloomed profusely during a period of nearly six months, they were in the most perfect health and vigor. Among the plants afterwards so treated, were azaleas, begonias, caladiums, carnations, crotons, dracænas, eucharis, gloxinias, palms, pandanus, poinsettias, primulas, roses, hot-house grape-vines, and hundreds of other genera. In strong-growing plants the roots can be seen striking upwards into the mulch in four or five days after it is put on, and in nearly all cases within two weeks.

One great advantage is that by this system plants can be grown as large and fine in a four-inch pot as in a six-inch pot without the mulch, for the reason that the plant is now fed by the moss and bone from the surface of the pot—the best feeding point, as most cultivators of experience now believe. Another advantage of the mulching system is its great saving of labor, for it just takes about one-fourth of the time to mulch the surface of a pot as it does to shift it. Another, is its saving of watering—the moss acts as a sponge, retaining and giving out the moisture to the plant just as it is wanted. Another, that it crowds down all weeds, and does away with the necessity of stirring the soil in the pots or borders. Another and most important advantage to Mr. Henderson is, that it lightens the weight of his goods by one-half, that is, he gets as large a plant with half the weight of soil. In his practice of thirty years, he has never seen a method of culture that he believes to be of such importance; hundreds who have visited him this season have been equally impressed with its value.

It may be that this moss and bone mulching is nothing new in the culture of plants, as it is an idea, from its simplicity that may very likely before have occurred to others, and may have been long ago practiced; but it is new with him, and if any one has before done so and withheld the knowledge from the public, more shame to him, if the result with him has been as gratifying as it has been with Mr. Henderson.

PREPARATION FOR AN ORCHARD.—"If we were going to prepare a piece of ground for an orchard," says the Horticulturist, "we should manure it heavily and put in a crop of potatoes; then in October manure again lightly and put in rye. On this, in April, we should sow red clover. The rye off, we should then consider it ready to plant trees. For apples, pears, plums or cherries, we should mark out the rows ten feet apart, and put the trees ten feet from each other. This will be twice as thick as they will be required when full-grown, but they grow much better when thick together; and they will bear more than enough fruit to pay for the room they occupy, before the time comes to cut every other one away."

DR. HOSKINS, of Newport, Vt., finds the following in the N. Y. Times of Sept. 1st.

"LOST NATION WHEAT.—A. M. A., Orleans County N. Y.: This variety is frequently mentioned in newspapers, but is not heard of elsewhere. We have seen no mention of it in any lists of wheat grown for experiments in which every known kind was procured. The first mention of it was in Oregon papers, and it is hardly probable that any excellent kind of wheat could come into use without being very soon widely known, and it is, therefore, unlikely that this kind, if it exists at all, is worth much."

Dr. Hoskins comments upon the above as follows: "As the Lost Nation wheat has for so many years led every other sort in Maine, and has for half a dozen years at least been very popular in Vermont and New Hampshire, and as all (I believe) of the premiums offered by the Maine Farmer last year went to crops of Lost Nation, it would seem that our brother who runs the agricultural department of such an eminent metropolitan journal as the New York Times ought, at least, to have heard of it. It has certainly been pretty liberally discussed in some other New York journals, especially in the RURAL NEW-YORKER, the editor of which has been successful in transforming the Lost Nation from a Spring to a Fall (Winter) wheat which promises even better in productiveness than the famous 'Clawson.'"

WHEAT HYBRIDS.—In the Bulletin of the Botanical Society of France, February 27, 1880, says the Gardeners' Chronicle, we find a note of M. H. Vilmorin on the hybridization of wheat, the general result of which is that Triticum sativum and T. Spelta cross reciprocally with the greatest ease, and give origin to an offspring absolutely uniform, and in which all the individuals seem to have borrowed their characters from one or other of their parents in rigorously identical proportions. M. Cosson, in adverting to M. Vilmorin's researches, recalled similar phenomena in Ægilops triticoides, a fertile hybrid, the characters of which are so fixed and invariable as to constitute a species.

EX-GOV. FURNAS.—We find the following in the Omaha Daily Herald. "Ex-Gov. Furnas has been a member of the State Board of Agriculture for twenty-one years, and one of the foremost promoters of the interests of Nebraska's farmers and horticulturists. It was quite fitting, therefore, that his associates should present him with a testimonial. The token is an ebony cane, highly polished and handled with a solid gold crook, richly engraved and chased. The inscription from the donors is engraved on the crook, and their names appear on a shield. The following are the sentiments and names of the donors:

"Presented September 25th, 1880, to Robert W. Furnas, ex-President State Board of Agriculture, by members of the Board, as a token of regard and appreciation of his valuable labors, for twenty-one consecutive years of active service as a member of the Board." Then follow the names.

PRACTICE ON THE FARM.—The Royal Agricultural Society very rightly, when adopting its motto "Practice with Science," placed practice first. It is in close attention to details that the elements of success in farming are to be sought. Economy in general management cannot be attained and habitually practised unless a man understands "even to the nail's breadth" the particular departments of his business. This particular knowledge can only be acquired on a farm step by step and day by day, as the working of the farm goes on. The ornamental famer, like the ornamental manager or director in commercial affairs, is a complete failure. We find the above in an editorial of the London Agricultural Gazette.

Everywhere.

A TRIP THROUGH SOUTH JERSEY.

E. WILLIAMS.

YIELDING to the wishes of a friend to accompany him, I have recently revisited South Jersey after an absence of 15 years or more, and was pleased to note the changes that have taken place in that time. Taking an afternoon train on the Central Railroad at Newark, a ride of about two hours brought us to Manchester, where we stopped for the night. My first visit to this place was before the railroad was built, and, with the exception of two or three settlers, all was then one vast wilderness. Now two or three substantial brick stores, with the cosy cottages of the settlers, are a pleasing contrast with "the olden time," and a large jute factory—which I regretted not being able to visit—affords employment to a large number of the town people.

My friend's object being to see the country, we were up early the next morning making a tour on foot over the town and the surrounding country, giving him a pretty clear idea of what once was known as the "Pine Barrens" of New Jersey. The soil is sandy and naturally poor; to many who are only acquainted with heavy soils it would be considered worthless; yet the fine and thrifty maples that line the main street show, beyond question, there are elements of fertility beneath the surface, that the casual observer would not suspect; but surface-rooted crops need and demand manure for success, and the ignoring of this fact, and the difficulty or inability to supply it, are the chief causes of failures and dissatisfaction. "Feed the soil if you would be fed by it" is emphatically true here.

At Mr. Battey's, two miles east of the town, we saw very good corn on the poorest white sand with the aid of a little fish scrap, and where lime had been applied a few years previous, its benefits were plainly apparent. His grapes—Concords—with little care were doing very well; there was very little rot, and the clusters were large and well ripened. He also showed us a fine crop of Amber Sugar-cane eight to eleven feet high with three to seven stalks in the hill on land without a particle of manure. I hope he will give RURAL readers the results of his sugar and sirup experiments. Mr. B. also keeps bees with profit, but an examination of his onions induced my friend to conclude they would be one of the most profitable crops he could raise. I have never seen such wholesale destruction of strawberry plants by cut-worms as in a patch of about three acres of his seedlings which were almost entirely destroyed; in fact, this is the first well authenticated case where the veritable cut-worm has done the mischief. He said they were dug out by the handful from about a single plant, and thus vanished one of the finest prospects of a bountiful crop he had ever had. The soil thereabout is well adapted to grape growing, as Mr. B's. vines attest; but the rot, over-production, and subsequent low prices had caused the abandonment of acres of vines near his place, by the owners who, having invested their all in one pursuit, had been compelled to return to mechanical labor for their bread and butter.

Our next point was Tom's River, the quiet county seat of Ocean County, where we spent several days. Here much of the land, especially north of the town, is heavier and more substantial than much of the sandy lands, and is well adapted to the growth of grasses and cereals. Here we saw finer crops of corn than we have seen in my county (Essex), not even excepting my own, which, however I think fully as good as the average hereabouts.

A mile or so east of town is "Cranmoor Farm" on which is a fine herd of Jersey cattle, where the proprietor, a N. Y. city merchant, and his wife spend their Summers and surplus funds in developing the herd and the resources of the farm, in preference to visiting the fashionable mountain or seaside resorts, and not only do they take pleasure in it, but benefit the whole community by giving employment to scores of laborers. At the time of our visit the farm buildings were being remodeled, and a large force was engaged in reclaiming a piece of swamp land along the river, which in time will be the best grass-producing portion of the farm. A steam engine at the barn grinds all the feed used on the place and that for the neighbors besides, and steams the fodder in Winter.

A short distance east is the residence of your contributor, the venerable A. B. Allen, whose evergreen and deciduous ornamentals on the lawn as well as the fruit trees in his garden, show what an apparently poor soil is capable of producing in the course of 10 years. His cherry trees were particularly fine, and his pears and apples, both standards and dwarfs, were very creditable.

A mile or so further east is the new Summer resort of Highland Hights, the camp-meeting ground occupying a natural grove on a bluff 30 to 40 feet above the river, the surrounding ground being disposed of in lots, many of which are already occupied by handsome cottages, and more are in course of erection, thus opening up a demand for the surplus products of the surrounding country.

To the north of the town, on what is called the Freehold Road, for several miles extend nice productive farms that would be a credit to any portion of the State, whose crops attest the generous and productive capacity of the soil, proving to the most casual observer that South Jersey is not all a sandy, barren wilderness. Here we saw a farm of 500 acres (far too much for any one person to own in such a locality), used for dairy purposes, the pasture fields affording abundant evidence of their ability to produce the cultivated grasses satisfactorily.

Falling into the custody of the Sheriff and the editor of the Courier, we were shown over the county as far as Whitesville and beyond, a distance of about 14 miles, not excepting the cranberry bogs, where the yield was expected to reach two hundred bushels per acre at the lowest estimate. During the trip we passed over thousands of acres of wild land of good quality, which, cleared and put under cultivation, would yield bountiful crops. The trouble is, it is held in large tracts by individuals and companies who neither improve it themselves nor dispose of it at such prices as will justify others to step in and occupy it. A good deal less of this "dog in the manger" policy would be a benefit all round.

Near Lakewood we called at the extensive fruit farm of Capt. Perry, managed and directed by Mrs. Perry. The orchards, though young, were very promising and her Clairgeau trees, heavily laden with fine specimens of rosy-cheeked fruit, were declared by some of the party to be the finest sight of the kind they ever beheld. May present hopes be realized in the future, for the lady deserves success. The young pear trees of Mr. McBean near-by were also looking remarkably well, producing exceedingly fine specimens of fruit. A large vineyard of Concord grapes adjoining his place, the property of a city gentleman, after about $10,000 had been expended on it, had been abandoned on account of the rot, and left to take care of itself, the owner returning to city business. Mr. McB. informed us that since it was left in this neglected condition, it had borne more and better grapes with less rot than before. Can we see any connection between good care, severe or excessive pruning, and rot in this case? There are plenty more cases of like character all about us.

I hope no one who gets into the custody of the aforesaid Sheriff and editor will fare any worse than we did, or find it a more difficult task to escape from them.

From Tom's River we went west by rail over a poorer portion of the county to Pemberton in Burlington County; thence on foot 14 miles to New Egypt in Ocean County, near the line of Burlington. This is a purely agricultural district and probably there is no better in the State, and such crops of corn and such an extent of corn fields I have not seen on this side of Illinois. My companion, who by the way was from Hunterdon County, had pretty elevated views respecting the corn-producing abilities of his section, and while admitting Ocean County was well up beside it, he acknowledged Burlington was ahead, without dispute; and yet in conversing with farmers *en route* as to the probable yield per acre of these fields, the estimates varied from 50 to 70 bushels of shelled corn. Now *if* they were anywhere near correct, how must a field look that yields 100 bushels of shelled corn to the acre, as is often claimed. If 70 bushels are the maximum of such fields as we passed on that tramp, I want to see *one* of a hundred bushels and have a hand in measuring it. [Hasten, friend Williams, to the Rural Farm.—EDS.]

Going to Highstown, in Mercer County, by rail, the crops, as seen along the route, were not so good. At this place Mr. Charles Black kindly showed us over a fine agricultural district in the vicinity of the town. The apple crop here is very abundant. His trees of Smith's Cider were a sight to behold, loaded down with fruit literally like ropes of onions, and this variety being an annual bearer, it is no wonder it stands so high in public favor in Southern New Jersey and Eastern Pennsylvania. He also took us to see the original tree of the Reed Plum, a seedling of the Illinois Plum grown by Mr. Reed. There were several trees besides the original one, all loaded down with an immense crop of the beautiful scarlet fruit, and this was said to be the case every year. The fruit is round, nearly or quite an inch in diameter, and is probably the best of all this class, and where our finer kinds do not succeed, it will prove a valuable acquisition, especially for canning purposes. Passing through Middlesex County to South Amboy and over into Monmouth County, we spent a day or two among the farmers and truckers from Keyport to Middletown and Port Monmouth; but space forbids further particulars. [We should like the particulars.—EDS.]

Horace Greeley's advice "Young man go West" was all well enough, but I am the more fully convinced from this trip that in accepting it, one might go further and fare worse than to anchor in New Jersey. I know the broad and fertile fields of the West are enticing, but low prices and cheapness are not always synonymous terms, whether applied to lands or crops; and society, schools, transportation, proximity to markets, etc., are all important factors in determining the choice of location, and are too often lost sight of. The query put to the Connecticut Board of Agriculture last Winter "Whether the cost of moving the corn crop of the West to the seaboard would produce the same crop at home?" was a pertinent one, and such questions should receive careful and mature consideration from all farmers who contemplate a change of residence. Pages might be written on this one subject alone, but these brief notes have already exceeded the limits designed.

Montclair, N. J.

RURAL SPECIAL REPORTS.

CANADA, Collingwood, Ont., Oct. 7.—The Ennobled Oats have done nobly. I have harvested nearly a peck, imperial measure. They are put away for seed next year. The mangels are ahead of any others we have, and are growing finely. The Cow-pea is growing away, as we have had no frost here yet; but it is doubtful if it will ripen so far North. The raspberry is alive and likely, I hope, to live; but it has not had fair play. We will use it better hereafter. All the flower seeds failed except one magnolia, on account of the drought, which was very severe in this section.

J. B A.

ILLINOIS, Ludlow, Champaign Co., Oct. 4.—Frequent light rains during September kept the pastures fresh and favored wheat, which now looks promising. A larger acreage was sown than last year. Considerable was sown among corn with one-horse drills. The press drill, with tubes like those of the corn-planter and a wheel following each tube pressing the seed firmly into the ground, and furnished with a seat for the driver, is the favorite drill now. Wheat yielded, in this neighborhood, from 15 to 20 bushels per acre; oats, 35 to 40 by weight; flax, nine to thirteen; Timothy seed, six to eight bushels. Corn-husking has not commenced yet, and the yield can only be guessed at. It is considered, however, only about half a crop. Wheat is worth 90c; oats, 25c; flax, $1.05; corn, 34c; Timothy seed, $2.25; apples, 35 to 40c; potatoes, 50c; butter, 20c per pound; live hogs, $4 50 per cwt. We have had no severe frosts yet, though on September 14th, we had a light one which singed corn leaves on the lowest ground, and on the 30th another hard enough to partially kill tomato and sweet potato vines. "G."

KAN., Wichita, Sedgwick Co., Oct. 10.—We have had the most unfavorable season, in this part of Kansas, that has been known for eight years. Drought, winds, changeable temperature, insects, etc., have all afflicted us. Wheat as reported by thrashers, averaged 10 bushels per acre; oats, 20 bushels. Grass was not one-half a crop. Corn is not gathered but is estimated to be cut short from a quarter to a half. The Fall is very favorable and most of the wheat sown. Most of the seeds and plants of the last seed distribution, as well as what I got of others, are gone where the "woodbine twineth," although I gave them the best and frequent care and attention under the circumstances.

A. J. P.

MICH., Georgetown, Ottowa Co., Oct., 7.—Our crops are as follows: Wheat yielded less than last year; mine was 21 bushels. Hay was very good. Corn averages about 60 bushels of ears per acre. Potatoes are a fair crop. Of apples we had almost too many. Peaches are plentiful. Barley, rye and buckwheat are but little raised here. Grapes are about an average and strawberries were not very good. Wild blackberries were plentiful. H. A.

MINN., Cedar Mills, Meeker Co., Oct., 4.—We have had a great amount of rain this season, yet the crops are all rather above the average, except corn; few pieces of wheat yield less than 20 bushels per acre. The Beauty of Hebron potato is as good as, or better than, the Early Rose, and a little earlier. M. E. B.

TEXAS, Dayton, Liberty Co., October 4—We are now enjoying fine weather for cotton picking, after our heavy rains last month. I have planted the Ennobled Oats again, as this is the proper season in this latitude. They are now up. Cotton worms made their appearance in September, but we were helped considerably by the wild canary, which gobbled them up in great numbers. G. G.

TEXAS, Lockhart, Caldwell Co., Oct. 6.—All cotton hereabouts is planted, not by hand but by cotton-planters of which at least a dozen different patterns are made and sold in this town. Indeed cotton planters are more generally used here than corn planters and I am using a combined corn and cotton planter which is a complete success. This is *apropos* of a late article in the RURAL. In that article a method of removing the lint from the seed is given. This will certainly be a decided advantage, if the process is not expensive. We sometimes wet the seed and roll them in ashes to dry them, which "lays" the lint, and makes them plant better. As to the removing of the lint making them come up five days earlier, I doubt it very much. When the ground is moist and warm, they will come up in a week, and very often begin to come in four days, and I think it hardly probable that they could be made to come five days earlier. S. K. M.

VA., Newmarket, Shenandoah Co., Oct. 7.—Farmers are seeding; every one is rushing to get in the wheat crop. Some of them seeded two to three weeks ago; others have just finished, while others are just beginning. Some farmers seed from 125 to 500 acres to wheat in this section. On an average in this valley they seed about 40 to 50 acres. Some wheat is up and looking well. Corn is a fair crop. Pumpkins, etc., are plentiful. Apples are hardly an average crop here. Prices are as follows: wheat, 88@93 cents; corn, 45@50 cents; rye, 60@65 cents; oats, 20@35 cents; pork, sides clear, 9@10 cents; hams, 12@12½ cents; shoulders, 9@10 cents; butter, prime, 20 cents; eggs, 15@16⅔ cents; lard, 7@8 cents; potatoes, 40@45 cents. P. S. W.

The Querist

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

SEVERAL letters asking substantially the same questions, often reach us within the same week, or before the answer to the first has been published. In such a case, we always presume that the answer to one, will suffice for the others also.

Planting Grape Vines; Blount's Corn, etc.

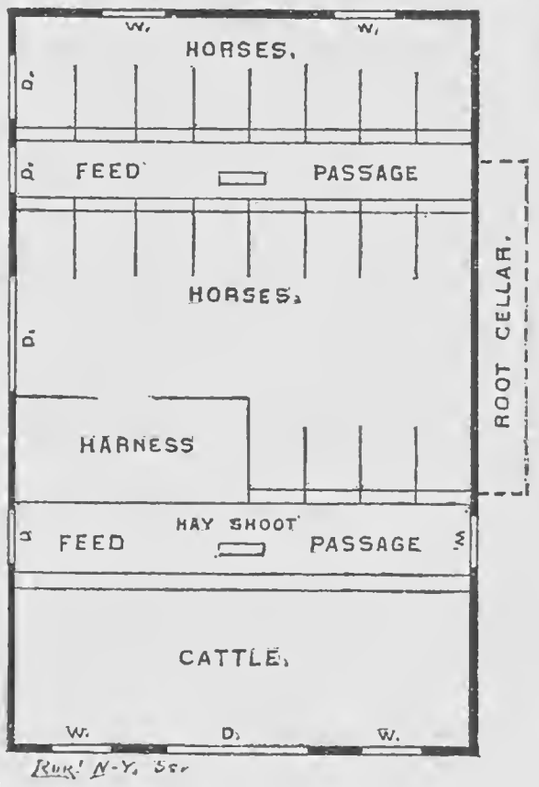
C. H. E. Montgomery, Mich., asks, 1, what is the value of shavings from the fleshy side of buffalo hides that have been preserved with salt and alum, per wagon load, for fertilizing purposes; 2, what amount of manure should be placed in a trench before planting grape-vines therein, and how deep should the trench be dug—the soil is a sandy gravel, with sand and clay for subsoil, while the location gives a perfect surface drainage; 3, full directions for budding fruit trees; 4, is Blount's White Prolific corn a Dent or Flint sort; where can seeds be had equal to those of the Rural Experiment Grounds.

ANS.—1, We do not know. Perhaps some of our readers can furnish the information. 2, Enough is as good as a feast. The practice of filling pits or trenches with rich, raw manures for vines or any plant whatsoever, is simply wasting time and money. A plant needs just so much food. If that is furnished, all is done that it is possible to do to give it health and vigor, except cultivation and situation. The plan of using loads of manure in the preparation of asparagus beds so that "once manured they will last for a life-time," as advocated by many, is extremely senseless and will no doubt so be considered in years to come when vegetable physiology and hygiene are better understood. If your soil is too heavy, add sand or leaf mold. If too sandy, use plenty of muck, if you can procure it. Use the same quantity of manure (well-rotted farm yard manure is best) that you would if preparing a field for a yield of 100 bushels of corn. A surface spread of bone flour and wood ashes from time to time would prove advantageous. The trench should not be dug more than 18 inches deep. Nothing is gained by inducing grape-vine roots to go deeper. 3, Our friend will have to refer to back numbers. Late Summer and early Autumn are the proper seasons for budding. We shall give full directions in time for another year's work. Grafting, which is Spring work, is the next to be considered. 4, White Dent with large grains and very small cobs. The ears average under size. 5, D. M. Ferry & Co., Detroit, Mich., probably, but we cannot say whether the seed has been as carefully selected as our own. *This* year we have selected the best ears (generally the top ones) only from stalks that bore five ears. Moreover, we have selected only from the shortest stalks and from those ears that ripened first, with the shortest shanks, etc., etc. We have spent hours in this selection tying differently-colored rags to indicate special characteristics. If in this way we should succeed in establishing a marked improvement, we shall again send this "Improved" Blount's to our subscribers. We may say that our selections from our last year's field, which was but a quarter of an acre and produced at the rate of 72 bushels of shelled corn to the acre, has, as it appears, made the corn two weeks or more earlier, so that it is now perfectly adapted to this climate, with time to spare. We are satisfied that the peculiarities of varieties of corn can be preserved only by such selection. That unusual marks or traits are thus fixed is proof thereof. All of our seed from stalks bearing three ears and over (except our own selection) will be sent to the Department of Agriculture, Washington, D. C. An application to the Commissioner may secure some.

A Convenient Barn.

F. S., Tonawanda, N. Y., would like a plan of a bank barn on level ground, the building to be 40 x 60, the lower part to be for stock—20 horses and about 10 head of cattle—and the upper portion for grain, mixed farming being the rule there. He proposes that the building should stand north and south and be seven feet in the clear, for horses, and the upper portion 18 feet, and made of boards. As stone costs $4 per cord there he asks, whether it would not do to have stone walls only 2½ feet high on three sides to save the use of that material. He also wants a small root cellar somewhere. Is a hip-roof better than a common one?

ANS.—We would suggest a plan for the purpose required as here given. The root cellar might be placed under the bank or bridge for the roadway to the barn floor, as shown. The stable portion should be at least eight feet in the clear; a hight of seven feet is too low for safety or health, as there is not room for a horse to throw up its head or for good ventilation. The walls may be made of concrete of gravel and hydraulic lime which will be as good as stone or brick. The corners should be



built up of brick or stone. A hip-roof is not desirable; a plain roof is better for a barn and is cheaper and tighter. The accompanying cut shows a plan of a barn such as is desired. Many good suggestions as to building may be got from The Carpenters' and Builders' Guide; or Harney's Barns and Stables; either of which can be procured of the American News Co., N. Y.

Skim-Milk vs. Corn or Bran, etc.

W. N., Afton, N. Y., asks what is the relative value of sour milk and corn or wheat bran for feeding purposes—how much sour milk is equivalent to, say, a pound of either.

ANS.—The only proper comparison that can be made between skim-milk or "sour milk" and corn and wheat bran is by comparing the dry, digestible food in 100 pounds of each. Skim-milk contains about 90 per cent. of water, and corn-meal and wheat bran about 14 per cent. of water. The following table will show the digestible constituents of each, together with the calculated value per 100 pounds.

	Digestible nutrients.			Nutritive ratio.	Comparative value.
	Albuminoids.	Carbohydrates.	Fat.		
Skim-milk	3.5	5.0	0.7	1.9	0.23
Butter milk	3.0	5.4	1.0	2.6	0.22
Whey	1.0	5.1	0.6	6.6	0.11
Indian Corn	8.4	60.6	4.8	8.6	1.10
Western Yellow Corn	7.5	67.3	3.1	10.0	1.04
Oats	8.7	43.3	4.0	6.2	0.94
Wheat bran, coarse	10.0	48.5	3.1	5.6	1.01
" " fine	8.9	51.8	2.6	6.9	1.00

These valuations are fixed upon the German estimate. They estimate each pound of digestible albuminoids as worth 4½ cents, and digestible fat the same, each pound of carbohydrates at 9-10 of a cent. The nutritive ratio means the proportion of albuminoids to carbohydrates and fat, but each pound of fat is equal to 2 4 pounds of carbo-hydrates. For example, skim milk has 3 5 albuminoids and .7 of fat, making 4 3 pounds in 100, and this multiplied by 4½ cents, gives 18 2 cents, and five pounds of carbohydrates (whey) amount to 4 5 cents, added, making 22.7, or 23, cents per hundred pounds; and the value of corn and other foods is obtained in the same way, It will thus be seen that 4 52 pounds of skim-milk are worth one pound of Western yellow corn, and 4 34 pounds are equal to one pound of wheat bran, and 4.08 pounds are equal to one of oats. We have also given butter-milk and whey for comparison We have found, practically, that skim-milk fed before getting too sour, is comparatively even more valuable than here given. When fed to pigs of 50 pounds' weight until they reached 150 pounds' weight, four pounds of skim-milk have been found equal to one pound of corn-meal and bran mixed together; that is, 400 pounds of milk would produce as much increase in weight as 50 pounds of corn and 50 pounds of bran mixed and fed together. All the elements in the milk are very digestible and all are utilized. Some may be surprised to find whey of about one-half the value of skim-milk, but that is when fed as nearly sweet as it can be. Whey is only a partial food, and requires some other food, such as bran, oats or oil-meal, to be fed with it. We trust this short table may teach an important lesson to many feeders.

White Horses.

M. R. H., Millwood, Kansas, asks whether gray horses become white with age.

ANS.—No; but they become of a lighter shade of gray. One can always judge the color of gray horses will be by the shade of gray of the head and joints. Horses of a gray color begin to get lighter when about five years old. There are very few perfectly white horses now, most of those called so being actually a light shade of gray. The original white horse came from Northern Africa, and rarely exceeded a hight of 14 to 14½ hands. The dun horse is said to have originated in Central Asia the chestnut in Tartary; the spotted in China, Piebalds are very numerous on the pampas of South America; black horses are supposed to be of English origin; and they are very rare in Arabia, while bays are common in all climates. For the last 200 years white horses have been raised by the Danish government near Copenhagen, with white hoofs, white manes, white tails and eyelashes, and rose-colored eye-lids and nostrils without a single colored hair or spot on their bodies. Christian IV received, from the Dey of Algiers, their ancestors, a white stallion and mare said to have been descendants of Mahomet's celebrated white mare.

Miscellaneous.

F. E. H., Harlan, Kan., having heard the barberry highly recommended as a hedge plant, asks whether it has any advantage over the Osage Orange for that purpose. The latter, he says, is not well adapted to interior hedges, as it is such a rampant grower. Although its top can, of course, be kept cut, its roots occupy too much ground. Wishing to hedge in his orchard and fruit garden, against depredators, he asks what hedge plant is best adapted to dry, strong, hilly ground.

ANS.—The Osage Orange is the best plant for you we know of. Next we should recommend the Honey Locust. The ornamental Japan Quince makes a strong hedge. The barberry is too slender in its growth and not vigorous enough for the land you speak of. See article "Trees for Windbreaks and Hedges," in last issue, for other trees suitable for hedges.

E. C. Sligo, Pa., has 18 catalpa trees set out about one foot high in April, '79. They are now of different sizes, two attracting a great deal of attention as they grew about six feet the past Summer, making with last year's growth nine or ten feet, with a few branches five feet long, near the ground, all this year's growth. Our friend asks how can these trees be got into the shape of an open umbrella, having no limbs near the top. Would it be advisable to cut the top off—or would doing so stop the growth.

ANS.—No, you need not be afraid of stopping the growth. Simply cut off the top branches at the hight desired and continue to do so each Fall.

E. L. A., Russellville, Ala., asks what kinds of wheat would be likely to do well in that section—northern Alabama; rust is the great and almost the only enemy to the plant.

ANS.—We have heard better reports of Nicaragua wheat than of any other variety in the Gulf States. Fultz, Bowden and Mediterranean are also more or less success-ful; but all are liable to be injured there by rust. Clawson and Boughton have also been tried in Alabama, with moderate success. Seeds can probably be furnished by W. B. Jones & Sons, Herndon, Georgia, who will also furnish local information as to varieties.

A. S. S., Waco, Texas, says that the Southern seasons are so much earlier than the Northern that to do justice to the seeds and plants of our Free Seed Distribution, they should be sent out to our Southern friends earlier than to those of the North, and he asks whether we can do so.

ANS.—We shall do all we can in this matter, and thank our friend for the suggestion.

E. S. B., Kent Co., Mich.—Wheats do not mix like corn. The fertilization takes place before the stamens appear which is known as "flowering." The crossing of wheats is a delicate operation and will need careful practice before success can be hoped for. Spreading the glumes and palets apart so as to introduce foreign pollen, is apt to injure the flower so that seed can not form.

L. S. I., Augusta, Ark., a year ago, set out some Black Cap Raspberries which, owing to unfavorable weather, made slow growth until the past season; now they are long and spindling, and he asks whether he should cut them back two or three feet now or in the Spring before the growing season.

ANS.—In the Spring.

S. T. B., Buckeye Centre, Ills., asks the best time to trim spruce or pine trees.

ANS.—March, August or September.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, OCT. 23, 1880.

COME now, RURAL friends or enemies, to the Rural Farm, and examine the yield of corn—or else accept the statements we shall present as the truth, and forever after hold your peace.

THE yield of Blount and Chester Corn has brought us a great number of urgent requests to sell quantities for seed. We must, as heretofore, refuse all. We value the confidence of our readers more than we do the profits resulting from such sales. Just so soon as an agricultural journal SELLS seeds or plants, just so soon its readers will naturally distrust the sincerity of its praise or censure.

C. C. GEORGESON, late of the RURAL staff, and now Professor of Agriculture in the State College of Texas, writes us as follows:

"I have examined the Tillandsia, usneoides (black moss), which grows here in abundance, and find that it *has* roots attached to the branches. I inclose a specimen which will show it."

The specimen shows that the thread-like roots merely serve to attach the plant and hold it in position as in all true epiphytes of which this is a good example. The roots are attached merely to the surface of the bark the same as moss or lichens cling to walls or rocks. The question we raised, to which Prof. Georgeson probably refers and which was explained by Prof. S. W. Johnson, was—"If air plants derive their sustenance from the air, whence come the potash, phosphoric acid, &c., found in the ash of such plants?"

A FEMININE SWINDLE has just collapsed in Boston. A few years ago a Mrs. Howe opened what she called the Ladies' Deposit, in which women only could invest their savings in sums of not less than $200 or more than $1,000, interest to be paid quarterly in advance at the rate of eight per cent. per month. Of course, any person outside of a lunatic asylum ought to have known that no legitimate business could afford to pay so heavy an interest on deposits—nearly one hundred per cent. per annum; yet enough fools, and many of them otherwise considered right-minded, were found in the seat of female culture *par excellence*, to swell the deposits to the neighborhood of a million dollars. The large interest seems to have been irresistible to hundreds, while the silly story of the manageress that benevolent Quakers were supporting the institution with $1,500,000, was swallowed unquestioningly. It has lately been discovered that no part of the funds was ever invested in business, and therefore that the "bank's" only income consisted in the deposits of its dupes, the interest on which was paid out of the principal. Lately, when, owing to a newspaper exposure of the fraud, depositors claimed their money, the institution unable to meet its liabilities, at once collapsed. From the outset it was a sheer fraud, and its originator stands a good chance of getting her deserts inside prison walls. Yet, after all, the fool-killer would find plenty of work in hundreds of country places just as well as among the gulled dupes of the Ladies' Deposit. How many fraudulent concerns thrive in every city of the Union supported mainly by rural gullibility, eagerly investing its hard-earned dollars in schemes just as dishonest as this collapsed Boston swindle and no more plausible.

FARMING FOR BOYS AND GIRLS.

An Agricultural Text-Book for Youths.

WE shall begin to publish next week and continue weekly, a series of short articles on the science and art of agriculture for the use of farmers' children by our contributor, Henry Stewart. These articles are intended to form a text book on agriculture which may be used in rural schools, and we expect them to be very useful and instructive. The series will include articles on poultry and the dairy for the use of girls. They will appear in the Department for the Young and be written in the manner of plain, simple, but entertaining essays, with illustrations. We call the attention of our young readers to these articles, and believe our older readers also will be interested in them.

THE RURAL BRANCHING SORGHUM.

IN calling attention to the article by Mr. Henry Stewart, on the Rural Branching Sorghum, we would remark that it has been grown at the Rural Farm and Rural Grounds for three years. Last year it matured seeds which were for the most past destroyed by sparrows. This year the seeds were planted late, so that they are now "in the milk" and probably will not mature. It is a singular fact that our six acres of this plant now growing near Aiken, S. C., which were planted earlier than our little plot at the Farm, have not yet, we are advised, matured seed, and "frost is feared." "It has grown to stalks and canes", writes the gentleman who is raising it for us.

From the first announcement of our "Plant and Seed Distribution" until the seed is actually received, we are in a fever of anxiety, lest failure, for one cause or another, may come to disappoint us and our readers. We are glad to be able to say that all of the kinds announced are secured beyond a doubt—except this Branching Sorghum, and in this case we have good hopes that enough seed will be harvested to supply each applicant with a trial package at least, though perhaps containing fewer seeds than, from the area sown, we had intended to distribute.

THE "EASTERN" TROUBLE.

DURING the late Turko-Russian war, the little mountainous Christian principality of Montenegro, with an area of 1,700 miles and a population of about 150,000 souls, burst into fierce war against the Turks with whom it had maintained a chronic state of warfare ever since the Ottoman occupation of the Byzantine Empire in 1452. On the conclusion of peace between Russia and Turkey the former stipulated that its fierce little ally should regain its independence, which was partly lost in 1862, and also obtain, for the first time in its history, access to the neighboring sea by the cession to it by the Sultan of the little port of Dulcigno on the Adriatic, hitherto an integral part of the adjacent Mahommedan principality of Albania.

During the war Greece, too, was eager to join in the attack upon the "Sick Man of Europe," in hopes of obtaining a goodly share of his effects after his demise, but the little kingdom's belligerent aspirations were checked by England and the other pacific Powers who were unwilling that Russia should be aided by an attack upon the rear of her foe, and anxious to confine hostilities within the narrowest possible limits. Accordingly Grecian warlike proclivities were easily restrained by assurances that Grecian territorial ambition should be measurably satisfied at the close of the war. When the Treaty of Berlin finally patched up a peace between St. Petersburgh and Constantinople, Russia strenuously insisted that her ally, Montenegro, should be satisfied, while caring little for the demands and prayers of Greece, which, in spite of a community of religion and much past friendship, had failed her in her time of need. It was finally agreed, however, that Turkey should cede to Greece also a strip of territory on the north of her present borders; but the Porte, taking advantage of the indefinite nature of this proviso, has hitherto failed to make any concession whatever.

The Powers having lately determined upon a joint naval demonstration to force the Sultan to carry out the provisions of the Berlin treaty, that dilatory and tricky potentate delayed to make any concession until the fleet was on the point of seizing more valuable parts of his territory, when, last Tuesday, he declared his willingness to surrender Dulcigno.

This tardy concession will probably lead to the withdrawal of the combined fleet, as the concert between the Powers, as to its action, was already in danger, even before the Sultan had yielded to the pressure upon him; but it is likely that at least England and Russia will still insist upon the proposed cession of territory to Greece and the promised reforms in Asia Minor and Turkey in Europe. The reluctant action of the Porte has saved Europe from at once taking a step that must have led to a war, the ultimate extent of which no modern prophet could have foretold; but the peril has not been removed, it has only been deferred.

So intimate are the economic relations of all nations at present, that any national disaster—such as failure of crops, bankruptcy or war—affecting one or more directly, affects all indirectly. This truth was forcibly exemplified, in a manner that touched the pocket of every farmer in the land, by the rise here of three cents a bushel in the price of wheat on the announcement, at the close of last week, that the combined fleet was about to take hostile action against the Porte, followed by a temporary fall of five cents a bushel on the arrival of the news that Dulcigno would be surrendered and the probability of a war be thus at least postponed.

THE PROSPECTIVE WHEAT MARKET.

The wheat crop of North America and Europe having been harvested long enough to allow of the thrashing of at least enough to indicate the average yield, so large a mass of information with regard to it, has been collected by different agencies that, by careful comparison and sifting, an estimate, at least approximately correct, can now be formed of the amount of the surplus in some countries and of the deficiency in others, and consequently of the probable price of the commodity during the coming months in the markets of the world.

In this country, although the prospects of the unharvested crop were excellent, the yield of thrashed grain has not been so large as was expected, and consequently our surplus for exportation will be considerably less than was anticipated earlier in the season, from the favorable reports of the standing crop and the increased area under it. A couple of months ago some sanguine estimates put the aggregate yield as high as 550,000,000 bushels, whereas, from present indications and statistics, it can hardly be much over 465,000,000 bushels against 448,000,000 bushels last year.

These figures show an excess of only 17,000,000 bushels in the total yield of the crop this year over that of last, and it is believed that the home requirements for consumption and seeding during the coming season will be from 15,000,000 to 20,000,000 bushels more than during that which has gone by, so that the entire exportable surplus from the present crop can hardly be much greater than that from the last, which, according to to the best attainable returns amounted, in round numbers, to 180,000,000 bushels.

In the United Kingdom, our best customer, the latest reports tell us that the yield of wheat this year is a fair average. An average yield there during the five years from 1865-'70 was 29 bushels per acre; from '75 to '79 it was 24 bushels, and last year only 18 bushels. The acreage under wheat there last year was 2,890,136, and this year it cannot be over 2,800,000. Estimating a fair average yield at 28 bushels per acre, the total yield of home-grown wheat this year will be about 78,000,000 bushels, while the average consumption of wheat in the United Kingdom is from 188,000,000 to 192,000,000 bushels, and in view of the natural increase of population, the latter quantity will most likely be required this year. On this basis there will be a market for 114,000,000 bus. in the British Isles. The latest reports from France say that the yield there is a small average. To the 30th of last June the imports of foreign wheat during the year amounted to 73,000,000 bushels, and it is estimated that from 30,000,000 to 40,000,000 bushels will be required this year. Until within the last couple of weeks Germany, Belgium, Holland and Switzerland were thought to be the only other European countries likely to need any considerable importations of foreign wheat, and the requirements of these were estimated at about 30,000,000 bushels, making the total of the European deficiency 179,000,000 bushels, or just about the amount of our exportable surplus.

From the latest cablegrams, however, it seems not unlikely that this year Russia, instead of exporting 80,182,704 bushels as she did in 1879, according to official reports, may this year become an importer of wheat, several cargoes of American grain having been already imported into some of her Baltic ports, and one at least into Odessa, in the Black Sea, hitherto her principal point for shipping wheat, backed as it is by the chief wheat-growing districts in the Empire. Several other cargoes have also been ordered for that place by the merchants there, a pretty strong proof that if Russia does not become a customer of ours during the coming year, she cannot, at any rate, prove a formidable rival. Although the West Indies and South America import little or no American wheat, yet they do a considerable trade with us in wheaten flour, and thus afford a by no means despicable market for some of our surplus.

Austria-Hungary, Italy and Spain will each have some surplus wheat for export, but the amount of this has not yet been ascertained. India, Australia, New Zealand and Chili will also, as heretofore, compete with us in the European markets. The exportable surplus of the first, according to present indications, will be about the same as last year; that of the second and third, whose harvest time comes about February, will probably be greater; while that of the last is likely to be somewhat less owing to the drain made upon the agricultural population by the requirements of her exhausting war with Peru and Bolivia.

In forecasting the price of wheat the coming season, then, it must be borne in mind that our exportable surplus will be, at the lowest estimate, fully as great as last year, while the demand in our European markets will be less, owing to the crops there having been very considerably better this year than last. On the other hand, our chief competitor hitherto in those markets is at best grievously crippled this year, and may even become a customer of ours, while competition from other quarters will not be seriously increased. It seems not unlikely that the increase in European crops generally this year will, to a great extent, be counterbalanced by the deficit in Russia, and that this country will find a profitable market for every bushel of wheat she can spare for exportation.

At this season last year the speculative movement of the great Chicago wheat syndicate had begun to influence the price of that cereal; but without any such influence to-day, prices are not much lower than at the corresponding date last year, and the tendency, both here and in Europe, is steadily upward. It must not be forgotten, however, that navigation will close in another month or six weeks, when all the industries of the country, and especially its agriculture, will be at the mercy of our railroads, which will doubtless at once put up freight charges, and every cent added to these is subtracted from the price paid to the producers, for "the farmer pays for all."

BREVITIES.

WE regret to state, in reply to many inquiries, that Fay's Prolific Currant, illustrated in this journal Sep. 28, will not be offered for sale this Fall. Mr. Josselyn has so decided.

ONE of the best evidences of the growing prosperity of the Southern States is the increasing call for skilled labor, machinery and appliances for the erection of repair shops, wagon and blacksmith shops, millwrights, and also for putting up new wood and iron-working machinery. In the number of all these little shops, which are really the forerunners of manufacturing, there is a promising growth, and the demand for laborers and operatives is with difficulty supplied. No better opening is offered for labor or capital than in the South.

MANY doubt that our Blount's corn, cultivated and manured as we have stated, has yielded 150 bushels of shelled corn per acre. "There must be *something* wrong," says one. "I do not believe that 150 bushels of shelled corn *can be* produced upon one acre," says another. The truth, however, is as we have stated and shall be able to prove. We once smiled at Mr. Conrad Wilson's talk as to the "Possibilities of the yield of Indian corn." But we have realized his possibilities by easy, inexpensive methods, and we have a very strong faith that we can do it again and again, and that every other farmer may.

WE have received the following from our friend in South Carolina, who is raising for us the six acres of Rural Branching Sorghum. Our readers may share with us the glimmer of hope which it gives.

AIKEN CO., S. C., Oct., 4.

Dear Sir:—So soon as your two hasty notes were received, I hunted for Mr. S., and this morning is the first time I have been enabled to see him. He says he thinks he can let you have some. He is in the same boat with me. All depends on when the frost strikes. 'Tis excessively dry here now, and that has saved us so far; for they have had frost north and east of us. If frost will only hold off for two or three weeks, we shall be enabled between us to let you have some. So *take courage*. We may be happy yet. Don't give up. Will you just keep quiet for a few days? We will report as we progress. I hope for the best. My loss will be heavy.

A RESPECTED friend and experienced horticulturist criticizes the New Jersey State Fair thus severely. His strictures are substantially those which we have many times heard before and, indeed, have ourselves uttered in these columns. That we could have no personal motive in giving them publicity—if, indeed, we could be narrow-minded enough to be so influenced by such a motive—is apparent from the fact that we have no acquaintance whatever with any one of the officers of the Society: "I was at the Waverly Fair only one day, but saw enough to know there was no improvement in the arrangement of the horticultural department in which I take most interest, and my fair criticism of the exhibit would include a severe scoring of the utter inefficiency of the Superintendent and Board of Managers, whose only aim seems to be to get together a large exhibit regardless of any system in arranging it or allowing the contributor to derive any credit or benefit therefrom, except an accidental award or two. The self-importance and egotism of official position and the desire to make money seem to be the chief desires and aims of too many of the present managers. To get into office and keep in, is their motto."

For Women.

CONDUCTED BY MISS RAY CLARK.

MARRY A GENTLEMAN.

Marry a gentleman,
Girls, if you can,
Minded and built
On the generous plan,
Though he may neither
Have silver or gold!
Title or fortune,
"To have or to hold."

Though he may labor
With spade and with hoe,
Though he may naught
But his mother tongue know,
Though he live under
Society's ban,
Marry a gentleman,
Girls, if you can.

Marry a gentleman,
Girls, if you can,
Gentle and tender
Though no less a man,
One who will treasure,
His child or his wife,
Scorning to rob them
Of sweetness in life.

One who will never
The brute's part assume
Filling his household
With sorrow and gloom,
If on love's altar,
The flame you would fan,
Marry a gentleman,
Girls, if you can.

You will be happy,
And you will be glad,
Though he only
Be commonly clad,
Pleasure is fleeting,
And life but a span—
Marry a gentleman,
Girls, if you can.

DESCRIPTION OF CUTS.

FIG. 339 AND 339½.—BACK AND FRONT OF DRESS FOR LITTLE BOY OF THREE YEARS OF AGE.

The dress is shown in different materials. Fig. 339 is of fawn cashmere, with checked collar, cuffs,

FIG. 339. FIG. 339½.

and waistband; Fig. 339½ is of striped cloth, trimmed with bands of velvet piped with satin.

FIG. 340.—MAGNOLIA PANEL.

This is a design for panel decoration. The artist will readily detect beauty of arrangement and an appropriate flower for exercises of skill. A copy of this touched up with natural colors will make a pretty ornament for a mantle or bracket.

FIG. 341.—BONNET.

The bonnet is of black chip, trimmed with dark

FIG. 341.

ruby twilled silk, coffee-colored lace, and coffee and ruby feathers.

FIG. 342, 343 AND 344.—WORK-BASKET.

Any round wicker basket with handles will be suitable to be ornamented in this style. The inside is lined with olive-green satin, finished at the Illustration fig. 343, which fringe ornaments the edges with the heading of the fringe shown in outside of the basket. A wide ecru braid is used for the heading; it is ornamented with long-stiches, worked in olive and crimson wool, and a scalloped fringe made by working loops of wool over a mesh into the braid, one scallop of crimson and one of olive alternately. The method of making the rosettes of Berlin wool which separate the tassels is shown in Fig. 344. The tassels are made by tying equal lengths of wool together; they are suspended from the braid by double lengths of wool, knotted in at the depth of scallop.

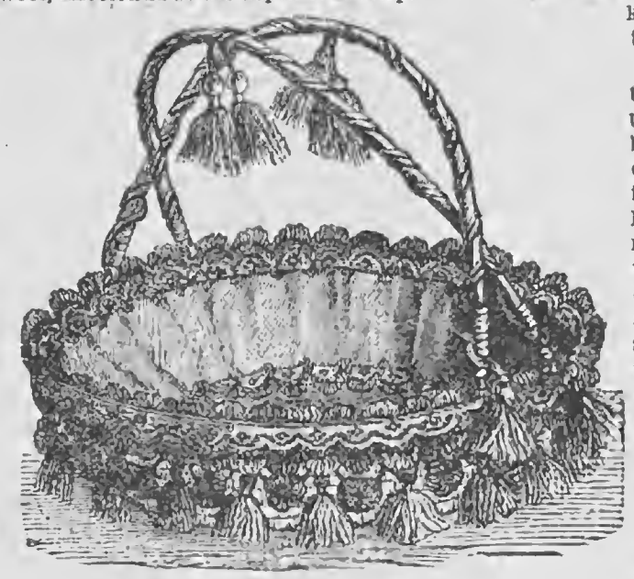

FIG. 342.

FIG. 345.—COVER FOR FLOWER-POTS.

The foundation is of card-board, covered with brown paper, cut to fit the pot it is intended to cover. The stripes are formed of oak-bark, glued to the foundation. The borders at the top and bottom are composed of petals of fir-cones, acorns, oak-galls, and beech-mast; these must be carefully cleaned with a brush and water. The separate petals are softened in water, and are sewn to the card by a needle and brown silk; the larger pieces are fastened on with glue. When the work is completed and quite dry, it should be painted over several times with a good, clear copal varnish.

BOYS, AND THEIR HOME SURROUNDINGS.

VIRGINIA FRANKLIN.

In all the articles written for the comfort and beautifying of home life, in its thousand varied aspects. I wonder why it is that so little is ever said pertaining to the home life of the boys of a family.

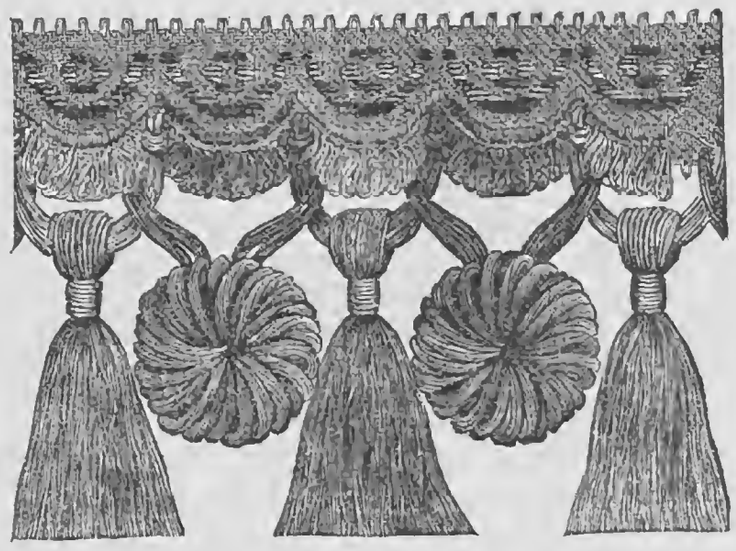

FIG. 343.

I know there are the hackneyed themes about making home attractive in reading matter; innocent games; cheerful social intercourse; with other things that all go to make up an ideal home for the whole family; but what I have especially in mind now, is the apparent little interest taken in the surroundings of the boys' private life, though in most homes it might well be thought—by a glance into their rooms—that no such idea, as a wish for seclusion, even lodged in a boy's brain.

Perhaps one reason why mothers give so little thought and time to the comfort and beauty of boys' sleeping apartments, is, that as they are in it so seldom (most of their time outside of school being spent in the street) it is thought of no consequence, but were those rooms made equally attractive with those in which their sisters spend so much time and take pride in beautifying, would not the boys be oftener found in their rooms, instead of roaming off, no one knows where, from the time school is dismissed until tea-time, and alas! too often in the evening.

Let us look at the average room occupied by the boys of a family, situated oftentimes in the less attractive portion of the house, being dark and dismal, as if boys and sunlight were wholly at variance with one another. I, for one, never yet saw that boy who does not like all the fresh air and sunlight he can get, and were mothers more ready to admit these same health giving mediums into the boys' rooms, they would not have so much cause to complain of their being always in the street. Then too there is the almost universal custom of furnishing these rooms with all manner of odds and ends, in fact using them as so many store-rooms for dilapidated furniture, this together with faded carpets, curtainless windows, and bare walls, makes an altogether uninviting, cheerless apartment.

Nearly all homes have some pleasant room that could be very easily given up to the boys. Let each have a separate appartment if possible, but, if not, give to each his individual part of closet and bureau, that he may learn to be orderly.

Let them have a good substantial set of furniture (which can be purchased without great expense, in these times) and don't allow a broken chair; faded carpet; cracked pitcher, or mirror, in the boy's room, any more than you would think of putting them in the guest chamber, which always looks so tasty and neat.

As regards the decoration of the walls, the boys themselves will soon furnish the pictures, if they can be assured there is a place where they can be kept, and all fear of their being consigned to the dust box is removed.

Suppose these pictures are not always of the higher order of art, they surely show that the boys have some appreciation of the beautiful in life, therefore if the collection of picture cards is good and wholesome in the subject portrayed, give them an honorable place on the walls of the boys' rooms, and never fear but what their taste will be educated to a higher standard in due time. Again, boys must, and will have all sorts of articles collected in different stages of their life, as every mother can testify, but even the most heterogeneous collections can be made to have places of their own, so the boy can have his pleasure of possession, and the mother's pride in her orderly house remain undisturbed.

Then, mothers let "the boy's room" be just as warm, bright and cheerful as motherly love and sisterly ingenuity can make it (for depend upon it boys do notice and appreciate little useful ornaments in their room, even if they don't speak of it) and if the room is often full of merry boy companions, drawn there because of its attractiveness, don't fret either because of the noise made, or confusion that will take only a few extra touches to straighten, but be thankful that you have succeeded in making "home the best place" to the boys.

HINTS.

To restore color when acid has been dropped on any article of clothing, apply liquid ammonia to kill the acid; then apply chloroform to restore the color.

To Clean Gold.—Powder some whiting, and make it into a moist paste with some sal volatile. Cover over the gold ornaments and surface with a soft brush, let it dry, and then brush it off with a moderately hard brush.

To Join Alabaster.—Ornaments of alabaster or plaster may be joined together by means of a little white of an egg thickened with finely-powdered quicklime, or by a mixture of newly-baked and finely-powdered plaster of Paris, mixed up with the least possible quantity of water.

To Make Lavender Water.—Best English oil of lavender, four drachms; oil of cloves, half a drachm; musk, five grains; best spirits of wine, six ounces; water, one ounce. Mix the oil of lavender with a little of the spirit first, then add the other ingredients, and let it stand, being kept well corked for at least two months before it is used, shaking it frequently.

To Wash Flannels, Etc.—It is always best to wash flannels, calico dresses and aprons before the white clothes are wet, especially if the day is cloudy and threatening. Then if it rains the white clothes can be rubbed, scalded and left in the rinsing water, and it is a small matter next day to wring them out, blue them, and hang them out to dry.

Crimping Hair.—To make the hair stay in crimp, take two pennyworth of gum-arabic, and add to it just enough boiling water to dissolve it. When dissolved, add enough alcohol to make rather thin. Let this stand all night, and then bottle it to prevent the alcohol from evaporating. This put on the hair at night after it is done up in paper or pins will make it stay in crimp the hottest day, and is perfectly harmless.

Necessity of Good Ventilation in Rooms Lighted with Gas.—In dwelling-houses lighted by gas, the frequent renewal of the air is of great importance. A single gas burner will consume more oxygen and produce more carbonic acid to deteriorate the atmosphere of a room than six or eight candles. If, therefore, when several burners are used, no provision is made for the escape of the corrupted air and for the introduction of pure air from without, the health will necessarily suffer.

To Gild Picture Frames.—The surface of the gilt must be carefully covered with a strong size, made by boiling down pieces of white leather or clippings of parchment, till they are reduced to a strong jelly. This coating being dried, eight or ten more must be applied: The size being mixed with a small quantity of whiting. The last coat is composed of screened massicot, or sometimes yellow ochre. Let it dry thoroughly, and then damp the surface a little at the time with a damp sponge, and apply the gold leaf before this dries. It will immediately adhere, and when dry, those parts which are to be brilliant are burnished with an agate or dog's-tooth burnisher.

Marking Ink.—A red ink for marking clothes, which is not attacked by soap, alkalies or acids, is

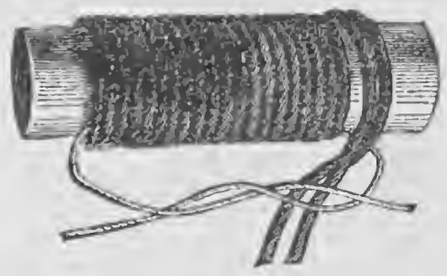

FIG. 344.

prepared as follows:—Enough of finely powdered cinnabar to form a moderately thick liquid is very intimately mixed with eggs' albumen, previously diluted with an equal bulk of water, and beaten to a froth, and filtered through fine linen. Marks formed on cloth with this liquid by means of a quill are often fixed after they have become dry by pressing the cloth on the other side with a hot iron. The ink will keep in well closed bottles for

FIG. 345.

a long time without separation of the suspended cinnabar. A black indelible ink is made by putting one and two-thirds parts of nitrate of silver in sixteen parts of distilled water, and adding two parts of gum-arabic and one-third part of sea-green.

Reflection from Lamps.—Never set the lamp upon a red table-cover; if you can not find time to make a green lamp mat, put a piece of green card board under the lamp and you will find the reflection upon your work much more agreeable to the eyes than that from the red cover.

CORRESPONDENTS' CORNER.

Will Miss M. D. please tell us how to play French Charades, Twenty Question, What's My Thought Like, Crambo, Borrow and Return? The

FIG. 340.

plays are mentioned in Rural of Sept. 18. She will oblige BERTHA H.'S SISTER.

Literary Miscellany.

WORK AND WAIT.

A HUSBANDMAN, who many years
Had plowed his fields and sown in tears,
Grew weary with his doubts and fears.

"I toil in vain! These rocks and sands
Will yield no harvest to my hands;
Tho best seeds rot in barren lands.

"My drooping vine is withering;
No promised grapes its blossoms bring;
No birds among its branches sing,

"My flock is dying on the plain;
The heavens are brass—they yield no rain;
The earth is iron. I toil in vain!"

While yet he spake a breath had stirred
His drooping vine, like wing of bird,
And from its leaves a voice he heard:

"The germs and fruits of life must be
Forever hid in mystery;
Yet none can toil in vain for me.

"A mightier hand, more skilled than thine,
Must hang the cluster on the vine,
And make the fields with harvest shine.

"Man can but work; God can create;
But they who work, and watch, and wait,
Have their reward, though it come late.

"Look up to heaven! behold and hear
The clouds and thunderings in thy ear—
And answer to thy doubts and fear."

He looked, and lo! a cloud-draped ear,
With trailing smoke and flames afar,
Was rushing to a distant star.

And every thirsty flock and plain
Was rising up to meet the rain
That came to clothe the fields with grain.

And on the clouds he saw again
The covenant of God with men,
Re-written with his rainbow pen,

Seed time and harvest shall not fail,
And though all enemies assail,
My truth and promise shall prevail."

INMATES OF LESTER HALL.

(Continued from page 694.)

He smiled a little sadly and incredulously, but made no other comment. After a momentary silence she spoke again:

"Dr. Carewe, if some one had deeply injured you, would you revenge the injury?"

She turned towards him as she uttered the words, and looked up inquiringly in his face.

"Of what avail!" he said. "Would revenge wipe out the injury? Would not the noblest revenge be to pardon the offender?"

"Is that your theory?" she said, turning away. "It is not mine!"

"Yours!" he said, smiling. "What can your bright life have to do with revenge!—your life, which is as cloudless as even I could wish it!"

"Even you!" she repeated, with some scorn. "Even you! What do you know of my life?"

"It is a happy one, is it not?" he said, gently. "It has no clouds to overshadow its brightness."

"Has it not? You forget," she said, coldly. "You forget my brother!"

She turned to him as she spoke, and saw, as her words fell upon his ear, that he started and turned very pale, but he said nothing.

"Avenging an injury would not blot it out," she said, "but would it not be a satisfaction to know that it was avenged, and that the person was punished who deserved to suffer?"

"I cannot tell," he said, wearily. "You know what our great blind poet says of it:

"'Revengo, at first though sweet,
"'Bitter ere long, back on itself recoils.'"

"Does Milton say that?" she said dreamily. "Well, he may be right. But this is a strange ball-room conversation, Dr. Carewe," she added. "Let us change the subject. What do you think of Mattie's engagement? Do you approve?"

"Who could do otherwise?" he said, smiling. "They are admirably suited to each other; and while I think Mr. Edgar a most fortunate man to have won such a bride, Miss Lester is also fortunate to have won such a deep, true affection as he has given her—such a perfect love."

"Love!" said Cecil, with a little sneer. Who speaks of love in this century of ours? We are far too sensible to credit its existence."

"You cannot doubt it," he said, half bitterly, half sadly.

"Ah! do not say such things," she said, scornfully. "Such society-talk is not in your way. Why should I know more joy and less sorrow than those around me?"

"Your life should never know a dark hour if I could guard it," he said. "Ah! if it were but possible for me to keep them from you!"

"What!" she said, with an attempt at galety. "A cold, reserved medico like you, would you care to keep dark hours from——"

She stopped abruptly, and something in his face silenced her.

"I am not cold—I am not reserved—when you are concerned," he said, with sudden passion. "I would to heaven it were so! Why should a doctor be cold?" he continued, mastering his agitation by a strong effort, and trying to speak lightly. "We are not all reserved; alas! some of us love but too well."

"Not wisely, but too well," she said, with her light, scornful laugh, which cut him like a knife as it fell upon his ear.

"Even so," he said with a smile.

"It is very pleasant to be cold, though," said Cecil, toying with her flowers, and looking very beautiful as she nestled in the fleecy lace shawl wrapped around her. "It saves one a great deal of suffering to have no heart!"

"True," he assented. "But one loses much joy. Ah! child," he went on, suddenly changing his tone to one of the deepest tenderness, "why do you try to belie yourself thus? Why do you try to make yourself out so cold and heartless, when your own nature is so noble and true? Do you think that I cannot read you aright? Do you imagine that I cannot see into that warm little heart of yours, and guess at all you are striving to conceal. Cecil, if I deemed you what you yourself say you are, should I love you as I do?"

She made no answer. Her face was averted from him; but if he could have seen it he would have been startled at its ghastly pallor, and he might have heard the fierce, loud throbbing of her heart. As she heard the impassioned words—as she noted the rich melody of his voice—as she felt (she could not see) the deep, earnest gaze which lingered on her face, she thought, with a sudden, fierce triumph, that what she had striven for she was about to attain; that she was near the fulfilment of her vow—near the vengeance for which she longed. This man had tempted her brother to ruin, and shame, and death. She, Rex. Lester's sister, had it in her power to give him pain and suffering—to make him know misery as acute as Rex. had suffered.

While she was thinking thus he stood silent at her side. He had spoken those words impelled by the passion of the moment, and ere they were uttered he repented having spoken them. His love for her, great as it was, was touched by a great humility, and he could see its hopelessness even when it mastered him most. And yet to have the right to love her—to hold her to his breast—to touch his lips to hers, Lawrence Carewe felt, in the madness of that moment, that he would willingly give his life!

But had he known the motives which had actuated her in the evident favor she had so constantly shown him, how would he have looked upon her? Had he known that she had used the wondrous charm of her beauty and sweetness to ensnare and bring him to her feet, only to gratify her own wild desire for revenge, how would he have regarded her? Who can tell? He himself was too noble to doubt her for a moment; he had invested her—as men are apt to do those women whom they love—ay, and women also—with all nobility, all sweetness, all perfection—while in her heart she was cherishing a base scheme unworthy of her!

"My remark was an impersonal one," she said, with a slight smile; "no more; so you might have spared that pretty speech, doctor."

He answered nothing; but there came a look into his eyes, which she saw—a look of incredulity and mortification, for her words, in their cold, languid scorn, seemed to chill him. Cecil saw their effect, and the languid, satirical smile passed from her lips, as she turned to him with a touch of that winning sweetness which she used but seldom, but which had so much power; and although her lips were white, she smiled as she lifted her eyes to his, while Lawrence Carewe's glance returned hers full of passionate love, and appeal, and pain.

For a moment she stood silent; something in that moment—some better feeling—was tugging at her heart strings and bidding her put aside the treacherous purpose. Why should she delude him thus? and while her heart pleaded for him, it may be that it pleaded too for herself—what if, in hurting him, she wounded herself also?

He drew a step nearer to her, and put his hand tenderly on hers. The resistless spell of her great loveliness was upon him, and he was powerless against it. Another moment, and he would have poured out at her feet the vast love that was burning in his heart. The passion within him would have found utterance, but even as he laid his hand on hers there was a quick step on the balcony. His name was repeated in several voices, and Mr. Edgar, pale and agitated, stood before him.

"Lawrence, will you come?" he said, quickly. "Mattie has fainted, and—come—come, for Heaven's sake!"

His agitation was excessive, and Cecil started forward, trembling in every limb.

"What is it?" she said, faintly. "Mattie ill! What is the matter?"

Dr. Carew glanced at her for a moment. All his composure had returned, and he was his calm, cool, professional self again.

"Come with me," he said, "you may be of use, but you must be calm and quiet, you know."

"Yes, yes," said Cecil, rapidly, as they threaded their way through the gay company in the ball-room, following Mr. Edgar, who led them out of the ball-room into Mattie's boudoir, whither they had carried her.

They had laid her on a couch, and Mr. Daton and her maid, both looking pale and startled, were by her side. Mattie was pale as death, and perfectly unconscious. As she lay she looked like a sculptured marble figure in her rich white draperies. Cecil ran to her side and knelt down, uttering a cry of terror, for there, flowing from the pale lips, staining the purity of the silken robes, was a vivid, red stream of blood.

By-and-by the guests dispersed, without having seen either Mattie or her sister; and as they went they said among themselves, with hushed voices and awed faces, that Miss Lester had burst a blood vessel and was dangerously ill.

CHAPTER XII.

CECIL'S AFFECTIONS DISCUSSED.

For several days Mattie Lester's life was in danger, and Mr. Edgar wandered about the house, looking haggard and miserable, and very unlike the gay, handsome, triumphant young lover who had wooed and won her. Even when the immediate danger was over there was grave cause for anxiety, and Dr. Carewe, was rarely absent from his patient for many hours together. His devotion and care knew no bounds, and as pulmonary diseases were his speciality, both Mr. Edgar and Mr. Daton were quite willing to entrust their beloved invalid to his care; while Cecil, who was terribly anxious and distressed, looked upon him with the most complete confidence and reliance, forgetting entirely that he who, in great measure, was the saviour of her sister was the destroyer of that noble young brother of whom she had been so proud, and whose legacy to her had been one of vengeance.

It was impossible but that they should be much thrown together during Mattie's illness, for Cecil was a very devoted nurse.

In after time Lawrence Carewe looked back on those days as some of the happiest in his life. It was so sweet to see Cecil's beautiful eyes turn to him in appealing entreaty—to see how she trusted and looked up to him—to touch her little hand sometimes in their ministrations to the sick girl—to hear her voice murmur some sweet broken words of thanks, or a fear that his constant attendance would fatigue him.

No wonder that in those days his love for her grew more and more intense—no wonder, too, that seeing her so gentle and lovable in her care of Mattie, he even dared to hope for himself; and so went on, blindly loving her and hoping to his fate.

At length the tender care and skill lavished upon her had their reward, and Mattie Lester's face was turned towards recovery; and once turned, she amended rapidly. Soon all danger was over, and the hearts of those who loved her lost their heavy load of anxiety and care.

Mr. Edgar's joy at her restoration equalled the pain he had endured at her danger, and his gratitude to the young physician, whose skill and care had been so greatly instrumental in her recovery was vast and limitless.

"You don't know what I feel towards you, old fellow," he said, with a tremor in his voice, as his two hands grasped Mr. Carewe's, and his pleasant blue eyes, with something suspiciously like tears in their depths, met his friends. "I cannot find words to thank you—I have no words. To strive to pay such a debt would be hopeless; but Heaven grant that the day may come when I can show you, in any way, my gratitude; and for the life saved you shall ask what you will, and it shall be yours."

The eager, passionate words came from his heart, and Lawrence Carewe knew all their sincerity, all their truth; and though he smiled as he disclaimed all gratitude, his own heart throbbed with a sudden wild hope.

"You owe me nothing," he said, hurriedly; "but if, in your generosity, you think that you do, some day repay it by saying a kind word for me to——"

His voice failed, and a flush rose in his cheek as he faltered at the name of the woman he had grown to love, even as himself had said, "not wisely, but too well."

"To Cecil," said Mr. Edgar, quickly. "Nothing would give me greater pleasure, old fellow, but—do you think she is worthy of such a heart as yours? She is beautiful and very charming, but she is so fond of power—of admiration——"

"Beneath it all she has a noble heart," said Dr. Carewe, warmly; "and I shall hold him greatly to be envied who shall win her love."

"Then may it be you," said Mr. Edgar, cordially, as he again pressed his friend's hand and went away to spend a happy hour with Mattie, who had been promoted to a couch in the boudoir, and who welcomed him with the prettiest blush and the sweetest smile imaginable.

Naturally their conversation turned on the man to whom they owed so much, and naturally, too, Mr. Edgar told his *fiance* of the doctor's hopes and fears.

"I don't think Cecil would have him," he said, dubiously. "She is so brilliant and so much admired, and of course he would not be a good match for her."

"Not a good match! Oh! Edgar, when he is so good, and noble, and true," said Mattie, reproachfully, "I should think Cecil a very lucky woman if she married him."

"So should I, dear, as far as he himself goes, but from a worldly point of view she would not be so."

"But, Edgar, I fancy that Cecil likes Dr. Carewe," said Mattie, with a little smile into her lover's eyes as he bent over her.

"Do you, my darling? That would be good news! What makes you think so?" said Mr. Edgar, drawing the pretty golden head on his shoulder, and settling himself comfortably on the low seat he occupied by the sofa.

"A great many things. She had always been so charming to him," said Mattie, meditatively. "So gentle and gracious; and when he was staying here, and when I was so ill, and when I was getting better, I used to notice several little things which seem to say that she cared for him. Really, Edgar, I think Dr. Carewe has a very good chance of winning her."

Meanwhile, Cecil herself—how fared it with her while her sister and her *fiance* were discussing the state of her affections, and while Dr. Carewe was resuming his usual practice with his heart full of hope and love? How fared it? Not well!

She knew, she felt sure, with a woman's unerring instinct in such things, that Lawrence Carewe loved her, and she knew, also, that she had striven to win his heart. She knew that for him, to gain that love, she had drawn upon her store of fascination, and spared no pains, and that her object in so doing had been, not his happiness, but her own vengeance.

She had that vengeance in her power now—it was possible to her to make him suffer even as her brother had suffered—to make him endure pang for pang, anguish for anguish!

What mattered it to her, she said, scornfully, to herself, as she paced up and down the apartment, pushing back her hair from her brow with impatient, fevered hands, that he had changed his way of life—that people spoke of him now as devoted, noble, and kind—if by his example and by his influence he had led her brother into sin, and shame, and death? Should he not atone—should he not suffer for that sin? And how?

Through a cheated hope, which should end in desolation; through a love given, to be rejected with scorn, and contempt, and mockery!

That was Cecil Lester's vengeance, and over it she brooded night and day, until her brain was dizzy and confused, and she had no power really to judge between right and wrong.

Sometimes softer thoughts would come to her. For that life which he had destroyed should not the life he had been instrumental in saving make atonement? Should she relinquish her cherished purpose? should she spare him now at the last? But such thoughts as these were but evanescent. Before her eyes once more would come the recollection of her brother's death-bed; the remembrance of his dying words, of her promise—her vow given to the dead, and sacred! And then she would take out the slip of paper, and con the brief words—cruel, heartless words—unlike, how vastly unlike, anything she had ever heard from Lawrence Carewe's lips, yet written in his handwriting, and signed by his name; and as she read them the passionate, unreasoning anger and hatred filled her heart again, and the longing for vengeance rose high.

But with it all she knew that, in cherishing the vengeance, she erred most deeply. She would not see—she tried to blind herself to the blamelessness and nobility of his life. She said to herself again and again that it was but a mask to hide and cover base, dishonorable actions, of which the world knew nothing; she shut her eyes to his frank, loyal, generous nature; to that tender patience and charity which thought no ill and suspected no evil; which believed in her purity and good faith when she was so little trustworthy; and there were moments—rare, alas! and swiftly passing—when that faith rose up and shamed her—shamed her to the very depths of her nature—but failed to turn her from her purpose.—To be continued.

A FAMILY OF CHAMELEONS.

THE chameleons have long been an object of peculiar interest to scientific investigators, because of their curious power of altering their appearance to conform to surrounding objects. Dr. Bacheler, of Midnapore, India, has given in the Popular Science Monthly the result of numerous observations of a family of chameleons which he has been keeping. The chameleon does not change its color always to match its surroundings, but its power to hide itself by a change of form is no less wonderful. In a normal state of rest the color is of light pea-green, at times blending with yellow. The least excitement causes transverse stripes to appear, running across the back and nearly encircling the body. These stripes occupy about the same amount of space as the groundwork, and are most susceptible to change of color. At first they become deeply green, and, if the excitement continues, gradually change to black. When placed upon a tree, the groundwork becomes a deep green, and the stripes a deeper green or black, and so long as they remain on the trees the color does not change. Placed on the scarlet leaves of the *dracæna* and among the red flowers of the acacia, no change was observed. But its changes of shape are still more remarkable. Sometimes it assumes the form of a disconsolate mouse sitting in a corner; again, with back curved and tail erect, it resembles a crouching lion, which no doubt gave origin to its name, *chamai-leon*, or ground lion. By inflating its sides it flattens its belly, and viewed from below, takes the form of an ovate leaf. The tail is the petiole, while a white serrated line, which runs from nose to tip of tail over the belly, becomes the leaf's mid-rib. Still again, throwing out the air, it draws in its sides, and at the same time expands itself upward and downward till it becomes as thin as a knife, and then viewed from the side it has the form of an ovate leaf which lacks a mid-rib, but the serrated line of the belly and the serrated back stimulate the serrated edges of a leaf. When thus expanded it has also the power to sway itself, so as to present an edge to an observer, thus greatly adding to its means of concealment. Half a dozen chameleons placed in a small tree, not three feet in diameter across the top, are very difficult to discover, although one is certain they must be there.

NEW PUBLICATIONS.

The Undiscovered Country. By W. D. HOWELLS Boston: Houghton, Mifflin & Co.

If the claim made by Mr. Trollope is true "that novels teach people, especially young people, how to talk;" then this latest work of the well known author deserves the prior claim of teaching people, old and young, how to think on at least one subject which under the very ear of progress, in civilization and education, continues to absorb and mystify the credulous portion of the community. A subject which in the interest of fraudulent pretenders and under the guise of spiritualism has become so disreputable as to rank among the greatest humbugs of the nineteenth century.

No one can read this book through carefully and not be strongly impressed by the contrast between the simplicity, truth, and earnestness of Dr. Boynton and the illusions he vainly struggled to grapple with. The results, so painful to all with whom he came in contact, cannot be too hastily passed over.

On the other hand the beautifully drawn character of Egeria commands our highest admiration and sympathy, showing an intimate knowledge, and the closest observation of a woman's nature.

Many of the pages are interwoven with a picturesqueness as fresh and bright as the scene they recall. Nature's tenderest moods seem to be crystallized in such perfection that no artist with his choice of colors could approach.

For those who appreciate the sentimental there is a little of the most natural falling in love that we can remember since our first experience. We heartily recommend the work for its pure, conscientious tone.

In the closing chapter the author tells us "The grass has already grown long over Boynton's grave. They who keep his memory think compassionately of his illusions, if they were wholly illusions, but they shrink with one impulse from

the dusky twilight through which he hoped to surprise immortality." If he has found the undiscovered country he has sent no message back to them. They wait; and we must all wait.

BRIC-A-BRAC.

It rested 'tween two rows of corn,
And wildly to itself it said—
"How can I help but feel forlorn—
I'm nothing but a pumpkin head!"

"SHE'S DET."

THE following colloquy took place outside a house in an American city, between some country visitors, unable to obtain entrance, and a German living next door:

"Jane at home, did you say?"

"Nein, Chane's nod ot home."

"Where is she?"

"She's gone the cemetery down."

"When will she come back?"

"Oh, she won't come back already any more; she's gone to stay; she's det!"

CICERO said: "Nothing should be done hastily." The old chap was wrong. If you see a man coming at you with an axe, get away as hastily as you can.

A MAN has invented a chair that can be adjusted to eight hundred different positions. It is designed for a boy to sit in when he goes to church.

WHY HE WEPT.

As an illustration of the case with which the one step can be taken from the sublime to the ridiculous, the following anecdote of the great French caricaturist, "Cham," is good:—

Once they were talking before "Cham" of the effect of a powerful painting upon the mind, and some one said, enthusiastically, "The painter with his brush can bring tears to the eye as well as the poet with his lyre."

"That is indeed true," replied M. de Noe; "I was in Ary Scheffer's studio yesterday, and he was showing me one of his pictures, and, though I am not usually in the melting mood, I fairly wept for ten minutes."

"Ah, I heard that Scheffer was treating a very pathetic subject, and you found his wonderful brush——"

"Oh, that isn't it; he stuck his wonderful brush in my eye while gesticulating."

FITTING emblems are not always appreciated. The neighbors of a poor fellow who died erected a tombstone to his memory and had placed above it the conventional white dove. The widow looked at it through her tears and said—"It was very thoughtful to put it there. John was very fond of gunning, and it was an especially suitable emblem."

"POLITICS is all a humbugs. Dey told me all I had to do vas to bay oud some moneys, and I vould git elected shust like a nodinks. Ven I vent to de bolls, vat you tink dat man at de bolls he told me? He shust told me, 'Don't you got excited;' und I vasn't do nodinks, but shust talking to my friends dat I tought vas agoing to vote for me. Und den he said again, 'Ve don't vant no excitement round here to-day;' but vat I care for him? Nodinks. I shust talked und talked mit everybody. und tings vas gittin' on bully. How many votes you tink I got? Dree, shust dree, one in A Instinct, and two in B Instinct, and one of dem was scratched. You shust wait; it efer I find de man who scratched my name off dat dicket I scratch him, you bet. Oh, yes, I vas beat."—Cincinnatt Gazette.

INDENTICAL.—In one of the most recent strikes an employer was using his best eloquence to convince the workmen how wrong they were. "You do the work, it is true," said he; "that is labor. I pay you wages for your work; that is capital. Therefore our interests are indentical." "Yes, shouted a workman, "about as identical as the interests of a milkmaid and a cow!" Without applauding the logic of the workman, the cleverness of the retort must be admitted.

VARIETIES.

THE papyrus manuscript recently discovered in the cave of a hermit near Jerusalem, and said to be the work of St. Peter, has been submitted to a committee sent out by the Biblical Society of London, and they have come to the conclusion that the papyrus is in reality the work of the great apostle. They have offered $100,000 for the documents in vain.

LARGE numbers of false turquoises have lately come from Vienna to London, and are still arriving. The detection is difficult, the back of every specimen having been pecked out and the holes filled with black cement, to imitate the matrix of the genuine stone.

AMAZED the other day at the rapid growth of a fungus, a botanist calculated that it had developed 10,000,000 cells in one day, or 116 cells a second. Professor Gray, however, cites an instance where a century plant formed 2,000,000,000 cells in twenty-four hours, or 231,481 a second.

THE following public expression of gratitude was recently inserted by a Saxon farmer and his wife in the columns of a German newspaper: "Thanks, most heartfelt thanks, to all those who, upon hearing of our misfortune on Monday, Aug. 16, when a sudden flash of lightning felled our two cows and she-calf to the earth, at once rushed to our assistance. Thanks more especially to the master butchers, Messrs. Thomas, Reichel, and Fischer, who kindly slaughtered the dying animals on the spot, thus preserving us from the cruel loss of finding the ill-fated beasts unfit for human consumption. Thanks, finally, too, to all those who speedily came from far and near, and bought up the meat with such avidity that by five in the afternoon there was not a scrap left. May heaven mercifully protect them and us all against any similar terror and calamity in future, and bless them a thousandfold for the truly extraordinary sympathy they have shown us.

"Kunersdorf, Aug. 18, 1880." C. DRESSLER AND WIFE.

SOME of the features of taxation in England are peculiarly just and desirable. If anybody leaves you $500 you have to pay $10, and if he dies without a will then pay $15 to get this $500; The Government fee on a $50,000 legacy is $1,000, and $1,500 if there be no will, and if the legacy be $1,000,000, then the Queen's fee is $77,500, or, without a will, more than $100,000. If you study and become a barrister, the admission costs you $250, or as much as you are likely to earn the first year. When you graduate in medicine you pay $50. If you become a mere notary public to administer oaths it costs you $140. When you execute a lease to rent your house for anything above $150 a year, you pay about seventy cents. If you want arms and crest on your carriage, you pay $11, and if you get these arms "granted" to you, and in a measure fully recognized, you have to pay $50 license. One carriage is taxed $11 a year. Your dog costs $1.25 a year. For a license to carry a gun you pay $2.50. The tax for every male servant is $4.

Weakness and sickness changed to health and strength with Hop Bitters, always.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

"YES baby," I said, talking foolishly to the little one, who lay on the lounge beside me. "You must look at mother and be content. I cannot hold you, and write, and that is one result of having a scribbling mamma." The little two-month-old babe smiled serenely at this small talk and was quite satisfied, so long as I chatted to her, now and then, between sentences. Yet young as she is, I find when we have visitors who dandle and jump her in their arms she would soon learn to like that kind of gymnastics. But she thrives well with warmth and quiet and will lie for an hour at a time beside me as I write or sew. I think the habit babies form during the first weeks of their existence decide the fact as to the amount of care they will need from the arms of mother or nurse. But they like to be talked to, for ours smiles sweetly when I tell her to "be good and let me write for the RURAL," proving that we are social animals even in infancy.

We have just been been putting up our pickles and trying a recipe for making them green, that I saw in a Western paper, which is said to be destitute of poisonous properties. Five grains of saffron in a quarter of an ounce of water; four grains of indigo carmine in half an ounce of water; mix and leave standing separately 24 hours; then put together and the result is a fine green—to be mixed with the vinegar which is to cover the pickles and then be poured off and fresh cold vinegar put on. I tried a little and succeeded in securing a very nice color, but to my mind nothing is better than grape leaves placed in layers in the pickle jar, between the cucumbers. They impart a natural greenness and we know they are safe. In speaking of grape leaves, I am taking it for granted that every reader, whether owning a small plot of ground, or a large farm, indulges in the cultivation of that luscious fruit, which in its richness embodies the wealth of a Summer's sunshine. As an ornament to a table for dessert, what is more beautiful than its variety of color? and its flavor how pleasant to the taste! Better for the children than puddings or pies, and less trouble to the housewife. Plant grapes and plant the best of which the RURAL gives us good description and advice.

HOUSEKEEPING HELPS.

WHAT housekeeper—by this I don't mean women who simply live in the house and let it keep itself, but those who feel an honest pride in housekeeping—does not appreciate any little help in household affairs she may receive from those more experienced than herself. This is especially the case with young housewives. I well remember what a time I had after the war was over, and the servants gone, to find out what was put in biscuits besides soda—whether water or milk was used. Now I can make good biscuits with a pint of rich buttermilk or thick milk, a full teaspoonful of soda well crushed and sprinkled on the flour; a pinch of salt, lard the size of a turkey's egg, and flour enough for a soft dough. It is always best to test the milk before using. If it be not old, do not use quite so much soda. This is also a good recipe for egg bread, but do not make the corn dough too stiff to run.

Try dipping your butter paddle in cold water, rubbing it with salt, rinsing off before working the butter. This is much better than dipping in hot water especially in Summer.

In tying up preserves always use several folds of paper to exclude the air. A nice way is to save all the old tissue paper patterns, cut the paper the size you want, dip into the white of an egg on both sides, put three or four folds over the jar and tie down. When dry it makes them air tight.

In making quince jelly, you can use as much pippin apple as you have quince—it makes better jelly. Be sure to cut the cores out or it makes the jelly ropy. MISS POLLIE.

SAUSAGE.

NINE pounds of fresh pork, six teaspoonfuls of black pepper, eight of salt and ten of powdered sage. Mix thoroughly, cook a bit to see if properly seasoned, and pack in jars, covering with melted lard. If you prefer to keep in skins, empty them, cut them into lengths, scrape with a dull knife, put to soak in salt and water, let stand three days, then turn them inside out and soak two days longer. Again scrape, rinse well in soda—baking—and water, wipe, tie up one end, blow into it, and if whole and clean, stuff with meat.

Bologna Sausage.

Five pounds of lean beef, two pounds of lean pork, one pound of fat, salt pork, ten teaspoonfuls of powdered sage, one teaspoonful of cayenne pepper, three of black, a grated nutmeg, two teaspoonfuls of powdered cloves, and salt to taste. Grind the meat, season, stuff into beef-skins, prick each in several places, put into warm water, bring to a boil and boil slowly one hour. Take out the sausage and let dry in the sun. Rub the outside of the skins with melted butter. If you wish to keep them longer than a week, rub the outside with black pepper. You can peel off the skins before sending to the table. MARY B.

HINTS.

To remove grass stains, wash the stained places in clean, cold, soft water, without soap, before the garment is otherwise wet.

The fine siftings of coal ashes are excellent to scour knives with.

To cure an ingrowing toe nail—keep a notch cut in the middle of the nail at the top. Always cut the nail straight across, instead of in at the corners.

To darken hair—apply strong, cold black tea every morning.

To clean kid gloves—wash in deodorized benzine. Dry on the hand; rub with a clean cloth while drying.

Cookies.

Two cups of sugar; one of butter; two eggs; one-half cup of sweet milk; three teaspoonfuls of baking powder. Flavor to suit the taste; mix stiff; bake in a quick oven.

Tea Cake.

One cup of sugar and two eggs beaten well together, half a cup of butter, half a cup of sweet cream, two cups of flour, and three teaspoonfuls of baking powder. LAURA.

QUESTIONS ANSWERED.

To Clean Horns.

Could you inform me how to clean and polish horns? Boiling does not seem to give the desired effect. A SUBSCRIBER.

ANS.—Horns are whitened or bleached by rubbing with powdered pumice-stone and water, exposing to the sun while still moist, repeating the process until the desired effect is produced. They may also be whitened by immersing them for a short time in a weak solution of sulphurous acid or chloride of lime. To prepare horn for ornamental purposes, saw it into plates or sheets, remove the pith, soften by soaking and boiling in water, after which expose it to a powerful pressure. A fine polish may be given it as follows:—Scrape the horn perfectly smooth, rub with very fine sand-paper, then apply charcoal wet with water on a piece of woolen and lastly rub with rotten-stone or putty powder. Finish with a little sweet oil rubbed on with soft leather.

Cement for Iron.

What will close up a crack in a stove door?
M. A. B.

ANS.—Mix finely-pulverized iron—procured at the druggist's—with liquid water-glass to a thick paste and apply to the crack.

Turkey Red.

R. J. W.—The directions for coloring the above are so complicated and lengthy that our space will not permit of their publication. The process is one not likely to be attempted on a small scale. However, if you still wish the method please send your address and we will mail it to you.

Nothing purifies and enriches the blood and destroys all poisons in the system like Hop Bitters.

Miscellaneous.

ST. JACOBS OIL
TRADE MARK.

THE GREAT GERMAN REMEDY.
FOR
RHEUMATISM,
Neuralgia, Sciatica, Lumbago,
Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains,
Tooth, Ear and Headache, Frosted Feet and Ears, and all other Pains and Aches.

No Preparation on earth equals ST. JACOBS OIL as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of **50 Cents,** and every one suffering with pain can have cheap and positive proof of its claims.

Directions in Eleven Languages.

SOLD BY ALL DRUGGISTS AND DEALERS IN MEDICINE.

A. VOGELER & CO.,
Baltimore, Md., U. S. A.

DAY'S Kidney PAD

A CURE for the most prevalent and fatal diseases that afflict mankind **FOUND AT LAST.** Internal medicines never did nor never can cure **KIDNEY DISEASE. STOP IT NOW;** apply Day's Kidney Pad **AT ONCE,** and be cured of all affections of the **Kidneys, Bladder and Urinary Organs.** It is the only treatment that will cure **NERVOUS AND PHYSICAL DEBILITY,** and that distressing complaint, **"BACK ACHE."** It will annually save many times its cost in medicines and plasters, which at best give but temporary relief. Sold by Druggists or sent by mail on receipt of price, **$2.** Our book, "How a Life Was Saved," giving a history of this new discovery and a large record of most remarkable cures, sent free. Write for it.
DAY KIDNEY PAD CO., Toledo, O.

HOPE FOR THE DEAF
Garmore's Artificial Ear Drums
RESTORE THE HEARING and perform the work of the **Natural Drum.** Remain in position without aid, **and are not observable.** All Conversation and even whispers heard distinctly. We refer to those using them. Send for descriptive circular.

News of the Week.

HOME NEWS.

MONDAY, Oct. 18, 1880.

THE elections on Tuesday, Oct. 12, in Indiana and Ohio both resulted in the election of the Republican tickets. The election in West Virginia resulted in a Democratic victory.....The Vermont State Legislature is proposing to change its election day to November and the time of the assembling of the Legislature to January..... Gen. Grant made a speech at a reception in Boston on the 13th in which he suggested the policy of more intimate relations with Mexico, saying that that country grew the tropical products needed in the United States, while the United States produce the manufactures which Mexico needs.....An estimate of the amount of gold and silver in the United States shows an increase since 1879 of $83,300,305 in gold coin and $37,748,350 in silver coin. This increase is said to be from actual coinage and the net import of United States coin. The total amount estimated as in the country on October 1 is $369,381,003 gold and $749,799,335 silver. Of these amounts there are $67,204,293 of gold in the Treasury and $302,676,709 in circulation or held by banks, and $72,454,600 silver in the Treasury and $77,344,735 in circulation. In addition the Treasury holds $68,040,540 in gold bullion and $5,557,579 in silver bullion, which the mints are turning into coin as rapily as their facilities will admit. This is a larger amount of specie than has ever before been in the country. The increase of gold bullion is from imports of foreign gold during the past year.....The celebration of the settlement of the city of Baltimore has engaged the people of that city during the past week....., The burning, on the 12th, of the Chicago Academy of Music destroyed one of the most popular and successful theaters of the West. This is the third time it has fallen a victim to the flames. It was first burned down during the great fire, but was immediately rebuilt, only sixty days being occupied in the task. In 1873 it was again burned down, and now the flames have once more paid their respects to it. ....At the school meeting, at Perry, N. Y., Oct. 14, Mrs. A. Walker and Mrs. E. Tuttle were chosen members of the Board of Education for three years.....The water company of Paterson, N. J., owing to the low stage of the Passaic, is unable to supply the citizens and manufactories with the water they need. Part of the city has been cut off, and it is contemplated to put consumers on an allowance of one or two hours per day. The rolling mill, the Bridge works, the Barbour works, Dexter, Lambert & Co.'s works and other manufacturing establishments are almost entirely idle for want of water. From 2,500 to 3,000 operatives are thrown out of employment. Especial efforts are making to keep water on hand to put out fires.

The West Shore Tunnel, at West Point, N. Y., caved in near the laboratory, Patrick Kerrigan, the foreman of the track layers, fell into the pit and it is supposed he is killed..... ....A syndicate of cattle dealers of Toronto, Ont., has contracted with the Allan and Dominion lines of steamships for space for 80,000 head of cattle for the ports of Liverpool, London, Bristol and Glasgow .....At the school election in Fayetteville, N. Y.—the home of Matilda Joslyn Gage—102 women voted. The women candidates for trustee, clerk and librarian, were elected. The battle was well fought on both sides. A daughter of Mrs. Gage is elected clerk and Mrs. Frances P. Carr trustee by 126 majority.

More Indian troubles are apprehended with the Utes in Colorado.....The Eighth Congress of the Association for Women's advancement met in Boston, on the 13th.....Frank Hammer, assistant postmaster at Allendale, Mo., was arrested on the 12th night for rifling registered letters and stealing ordinary letters and packets.....A fire at Stanton, Montcalm county, Mich., destroyed $50,000 worth of property.....Charley Deyo, of Shawangunk, N. Y., was fatally shot by a playfellow, who was carelessly handling a pistol.... ....Reports from Omaha state that a heavy storm west of that point has prostrated all the wires between Omaha and the North Platte.... ...A steam saw mill, the property of Robert Augur & Co., of North Bruce, Ont., together with a large quantity of lumber, shingles, etc., was burned on the 13th. Loss, $10,000.

A fire at Huntington, Conn., on the 13th destroyed the spoke factory, cider mill, vinegar works, barn and store house, all owned and occupied by George S. Thompson; also a dwelling house owned by Agur Johnson. Mr. Thompson's loss is about $15,000; insurance, $1,000. Mr. Judson loses $5,000, and has $1,800 insurance on his house and $400 on the furniture.....Several gentlemen connected with the Chicago, Milwaukee and St. Paul railroad company—including Messrs. Mitchell, Merrill, Carey and Walker—have organized the Central Illinois and Wisconsin railway company, with a capital of $1,000,000. It will construct a road from Rockton, on the Racine and Southwestern Division of the St. Paul road, to Kankakee, crossing the Chicago, Burlington and Quincy, Chicago and Alton, Rock Island and Pacific and other lines. Twenty miles of track will be laid this Fall.....General Grant visited Plymouth Rock, handled the sword of Miles Standish, at Plymouth, Mass, and held a reception, when the citizens and school children called upon him. Arrangements are making at Montpelier, Vt., for the reception of the General week after next.....At the fire on the 13th at Shelbyville, Ind., the total loss amounted to upward of $35,000. The principal losers were Conroy, Waller & Dapretl, furniture manufacturers, $23,000—insured; J. K. Stewart & Co., planing mill, $7,300—insurance, $1,500; Samuel Hamilton, $2,500—insurance, $1,000; W. L. Craycraft, dwelling, $1,000—insurance, $450. Several other dwellings were burned.

The water in the James River is so low that Richmond is threatened with a water famine. One of the reservoirs, which supplies the lower part of the city, is almost dry, and the other, which supplies the upper part, contains little over two feet of water. Several large industries, including a number of tobacco factories, which require a large water supply, suspended operations in consequence of the scarcity, throwing out of employment many hundreds of employes, including a large number of women and children.....Lawrence P. McCarthy, 14 years old, of Syracuse, was run over at Apulia, on the Syracuse and Binghamton Railroad, and instantly killed.....Mary Steinbaugh and William Crump, victims of the railroad disaster at Pittsburg, died at the Western Pennsylvania Hospital. These make 30 deaths up to the present time.

The forest fires south of South Amboy, N. J., have spread into Monmouth County, and are burning valuable timber lands. Many acres have been burned about Sayreville, and all hands have been called out to fight the flames, which are said to be under control.....As the result of arrangements made by Col. Thompson, Supt. of the Railway Mail Service, who has just returned from an official visit to the South-west, orders were issued at the Post Office Department to place railway mail service on the newly completed Louisiana Western Railroad, from Vermilionville, La., to Orange, Texas. This service, which is to begin on the 1st of November, will make a continuous line of railroad mail communication from New York City to Houston, Texas, and shorten the mail time between New York and Galveston and other points in southern Texas materially.

No rain of any great amount has fallen throughout the Delaware Valley for nearly three months, in consequence of which the Lehigh, Delaware, Neversink, and Lackawaxen Rivers are unusually low. Perhaps the heaviest losers by the long continued drought are those who have mills and manufactories on the shores of creeks emptying into the Delaware, between Hancock, N. Y., and Easton. Many flour and saw mills have done nothing at all for six weeks; a few mills and factories on the larger streams have been able to run part of the time. The effects of the drought are beginning to be severely felt in the small country villages where there are no water companies, the inhabitants relying wholly upon cisterns and wells for their water. In many places these wells and cisterns have given out, and the people are obliged to go long distances to get their water from the mountain springs. Many wells that were never known to give out are thoroughly dry. The farmers in the remote districts are put to great inconvenience on account of the scarcity of water, and some are obliged to drive their cattle a mile or more for drink.

The fraudulent woman's deposit Bank in Boston has been closed by the Sheriff.....A terrific explosion occurred at the Garden in the 14th, City Distillery Company's works at Clybourne-avenue and Morgan street Chicago, killing seven persons and severely injuring four others. An experiment was being tried with a new steaming process. The corn was put whole into a mammoth kettle, 16 feet high, and steamed. Then a strong pressure of steam was applied to force it through pipes into the mash-tub. The pipes became choked up, stopping the passage of the swollen corn and instantly increasing the pressure on the kettle. A terrific explosion followed, blowing the roof of the building clear off, and killing outright, or burying beneath the fallen timbers, scalding corn, and debris, ten men and one woman who happened to be in that part of the distillery .....Navigation is closed on the Delaware and Hudson canal on account of the drought.

A United States Judge has decided that Tennesee bondholders have no lien on the railroads of the State.....The Illinois Supreme Court has decided that the stockholders of the collapsed Chicago savings banks are liable individually and collectively.....Miss Annie Chapin, daughter of a prominent citizen of Warsaw, Ind., was arrested for forgery. Her lover visited her in jail, shot her dead, and then killed himself.....An injunction has been issued by the United States Circuit Court, at Louisville, prohibiting the Post-Office Department from interfering with mails for lottery dealers..... The contract for the extension of the Boston, Hoosac Tunnel & Western Railway has been let.... ...Ex-Sheriff Gouthreaux, of New Orleans, is alleged to be a defaulter to the amount of $150,000.

A severe storm of snow and wind occurred in the northwest on the 16th. At Milwaukee the wind was from the south, blowing between 60 and 70 miles an hour. A large fleet of vessels sought that harbor for safety and rode out the gale in the bay. Despatches from La Crosse say that the storm all along the Southern Minnesota railway was the severest known in years. Passenger and freight trains were blockaded in the snowdrifts from 10 to 12 feet deep, and teams with provisions have been despatched to their relief from several points. Reports of cattle, horses, etc., having perished are constantly received. It is the severest storm ever known in Southern Minnesota and Eastern Dakota.

THE WORLD'S FAIR.

The committee appointed to decide upon a site for the World's Fair, at New York, in 1883 are making a careful examination of the sites proposed. On the 16th the committee visited Manhattan square and Morningside and Riverside parks and examined their fitness for the purpose. The general belief is that Port Morris will be selected as affording the best facilities, both by water by land for visitors and the reception of goods.

[Wausau Central Wisconsin.]

Being asked concerning the Oil, Mr. Aug. Kickbusch informed the questioner that St. Jacobs Oil had proved an excellent and most useful remedy in every family that had used it. A large majority of cases pronounced incurable have been entirely cured.

FOREIGN.

The war between Chili on one side and Peru and Bolivia on the other is still raging with the ferocity characteristic of the Spanish-American race. There was lately some hope that the matter would be settled by the arbitration of the United States, and Minister Christiancy went from Lima, the capital of Peru, to Santiago, the capital of Chili, to urge that mode of settlement, but, according to the latest reports, he has returned without having accomplished his object. The Chilians have been devastating all the seaboard towns and country in the north of Peru, after having done the same in the south, and now they are threatening to destroy Lima and the rich surrounding country. They are rapidly collecting 30,000 picked troops for the purpose, and expect to capture the city in a few weeks. Peru seems resolved to fight to the last gasp rather than surrender any of her territory. The niter beds about which she began the war, are all now in the hands of her enemy, who is deriving a good income from the sale of the product. Bolivia has withdrawn most of her forces and is taking little part in the present phase of the struggle; all parties are becoming utterly exhausted, and the contest is fast coming to the same issue as the battle of the Kilkenny cats. Europe would have intervened already were it not that intervention is left to this country, through respect for the Monroe Doctrine.

The European outlook is somewhat less belligerent than at this time last week. Just as the detachment of the combined fleet was about to move against Turkey, the Sultan agreed to surrender Dulcigno with the surrounding territory, and thus averted immediate hostilities. The wretched little place has a miserable harbor, about 3,000 bigoted Mussulman inhabitants, and isn't worth half the money spent in securing it. Most likely the Mahommedans will quit it sooner than submit to Christian rule with its attendant cruelty when practiced by the fierce Montenegrins. The Turks and the latter are to hold a convention to-morrow to decide when the place will be given up. Already Greece says that unless the territory promised her is ceded within a specified time, she will occupy it. That would mean war with Turkey which wouldn't "leave a grease spot" of Greece, unless other Powers intervened, and then the war would spread—the Lord knows how widely. The "Eastern Question" will take a long time to settle.

Agitation, etc., continue in Ireland. Arrangements are being made by the Government to prosecute the principal leaders of the Land League and to throw a large increase of troops into the island. Parnell is defiant, and urges organization throughout every parish in the country. In France the decrees against the religious orders are being vigorously enforced, and a large number of magistrates have resigned rather than have any hand in the measure. The present House of Representatives will be dissolved next year, as its term then expires, and the Republicans are pressing anti-clerical action in order that the agitation attending it may by that time have subsided. Spain is agitating in a mild way for the restoration to her of Gibraltar—might as well ask for the moon. The completion of the great cathedral at Cologne has been celebrated with vast rejoicings, the Emperor William and his court attending, together with most of the German princes, princlings, princesses and prominent men.

[Mt. Clemens, (Mich.) True Record.]

W. T. Lee, Esq., of this paper says: Being convinced of the efficacy of St. Jacobs Oil in curing rheumatism, I have no hesitancy in recommending it.

AGRICULTURAL NEWS.

There have been already seven or eight million bags purchased in Calcutta for next year's California and Oregon crop, and the market there is advancing. With 6,000,000, which will be the probable make of the Jute Company, there is already a supply of 13,000,000 to 14,000,000 for the crop of 1881. It would seem that the business of jute raising would be a good one for our farmers to embark in: and so it would, did they understand it properly and could they emulate the patience of the Hindoo and raise it as cheaply.....The hop crop this year is about twenty-five per cent larger than last year.. ....A very heavy frost the first of the season, fell about Weldon, N. C. on the morning of the 14th.....Cotton-seed oil is sent from Arkansas to Europe, and is sent back to America as pure olive oil. Arkansas people think, however, that it can be refined there..... The production of silk goods by the New Jersey factories reached $15,000,000 in amount last year..... Seventeen Normandy stallions were shipped from this city to Wilmington, Ill., the 74, where, after recovering from the effects of their ocean passage from France, they will be sold. They are of different colors, although most of their coats were dapple gray, with the spots peculiar to these horses. In weight they range from 1,600 to 1,800 pounds, but were expected to gain about 200 pounds each in a few weeks. The importer expects that most of the stallions will go to California. They are valued at from $1,600 to $2,000 each. As the seventeen large stallions were lead through the streets single file to the freight depot of the New York Central and Hudson River Railroad they attracted considerable attention..... Grain exports from New Orleans during September were 1,430,421 bushels, against 727,679 in the corresponding month of 1879.....An officer at a fair, at Ridgeville, Ind., caught a man climbing over a fence and deliberately shot and killed him with a pistol.... ...W. H. Blackwood, of Haywards, Alameda county, California, realizes $12,000 from twelve acres of apricots.....The cost of cultivating an acre of medium white beans in Canada is set down at $14; the yield per acre at twenty to twenty-five bushels, and the average price at $1,25. Those shipped are mostly sent to the United States.....The beet crop of France is excellent, especially in quality; the factories are already at work, accepting orders, at good prices, for the delivery of new sugar..... Rugby, the town now being founded by Thomas Hughes and others in East Tennessee, is in some respects a community. The store will be on the co-operative plan, the purchasers receiving a share of the profits. A large part of the land will remain undivided, and be devoted to pleasure grounds and stock raising—the latter for the benefit of all settlers. The managers will provide plans for buildings free, but will not impose any restrictions as to the kind of houses to be erected. No liquor will be sold in Rugby, except by an apothecary for medicinal purposes.....The estimated cotton crop is 5,700,000 bales. Last Spring it was 7,000,000. Between Spring and Autumn the difference is almost one-fifth. Fall reports are most to be trusted.....The result of the distribution of jute seed by the State Commissioners of Louisiana, last June, can now be estimated. The reports from all sections of that State where the seed was planted are very favorable. The plant grows to a hight of 15 feet on alluvial soil and of 10 to 12 feet in the pine flats and hills. It is very free from the attacks of insects so injurious to other Southern crops, while the cost of production is small. Specimens of the fiber are now to seen at the New Orleans Cotton Exchange.

Dr. Pierce's Golden Medical Discovery cures every kind of humor, from the worst scrofula to the common pimple or eruption.

Four to six bottles cure salt-rheum or tetter.

One to five bottles cure the worst kind of pimples on the face.

Two to four bottles clear the system of boils, carbuncles, and sores.

Four to six bottles cure the worst kind of erysipelas.

Three to six bottles cure blotches among the hair.

Six to ten bottles cure running at the ears.

Five to eight bottles cure corrupt or running ulcers.

Eight to twelve bottles cure the worst scrufula.

Sold by druggists, and in half-dozen and dozen lots at a great discount.

Visit to Beatty's Factory, Washington, N. J.

The Hon. Daniel F. Beatty, Mayor of Washington, N. J., the piano and organ man, extends a cordial invitation to all to visit his manufactory at Washington, N. J. Those of our readers who desire to purchase either a piano or organ, can then have an opportunity to select the instrument they want personally. Besides, it is quite a treat to go through an establishment as large as that of Mayor Beatty's. He has made a wonderful success of his business, and it is said to be the largest of its kind in the world. Those of our readers who are unable to visit him should send for his Holiday Newspapers, beautifully illustrated, sent free of postage. Read Mr. Beatty's advertisement to be found in another column.

"It is Curing Everybody,"

writes a druggist." Kidney-Wort is the most popular medicine we sell." It should be by right, for no other medicine has such specific action on the liver, bowels and kidneys. Do not fail to try it. See adv.

We are strongly disposed to regard that person as the best physician who does most to alleviate human suffering. Judged from this standard, MRS. LYDIA E. PINKHAM, 233 Western Avenue, Lynn, Mass., is entitled to the front rank, for her VEGETABLE COMPOUND is daily working wonderful cures in female diseases. Send for circular to the above address.

Tropic Fruit Laxative, an agreeable substitute for pills and nauseous purgatives. One lozenge is the dose. Physicians prescribe it. Sold by druggists.

Hop Bitters strengthens, builds up and cures continually, from the first dose.

Frank Leslie, Esq., of the "Illustrated Weekly," says: "For some time past I have been using your COCOAINE, and think it far preferable to anything I have over used for the hair."

The Markets.

SPECIALS FROM THE CHIEF CENTERS.

Until Saturday, Oct. 16.

Boston.—BUTTER—The bulk of the receipts consist of long dairies and medium grades that are not wanted by the trade and are held at too high figures for export. Northern—choice creamery, ₩ lb., 30@32c.; choice New York dairy, 27@28c.; choice Vermont, 28@30c.; long dairies, 22@24c; common, 17@19c. Western—choice creameries, ₩ lb., 29@32c.; fair to good, 26@28c.; dairy-packed, 20@25c.; choice ladle-packed, 19@22c.; common, 16@18c. CHEESE—Northern factory, fine, ₩ lb, 13@13½c.; Western factory, fine, 12½@13c.; fair to good, 11@12c.; common, 8@10c. POTATOES—Northern whites sell at 45@48c. and Rose at 48@53c., while Eastern Rose sell at 50@55c., the latter price for Houltons. Sweet potatoes are in fair demand, and sell at $1.75 per bbl. for Norfolks. ONIONS—in bulk have sold from the cars at $1@1.05 per bush., and in barrels red ones have sold at $3 per bbl., Western yellow at $3.25, and nattves at $3 50. APPLES—are plenty and there is a fair shipping demand at $1@1.25 ₩ bbl for choice fruit. Fancy eating apples sell at $1.50@1.75, and common at 50@75c.; ₩ bbl. CRANBERRIES—are dull at $5 for Cape, and $3@4 for country. QUINCES sell at $3@4 ₩ bbl., and are in good supply. PEARS rauge in price all the way from $1.50@3.50 ₩ bush. CHEST-

NUTS are selling at $3 ₱ bush. SEEDS—The market both for Calcutta linseed and American flaxseed is nominal; the former held at $1.35, and the latter at $1.35 ₱ bush. Grass seeds are in diminished demand and prices are less strong, with a decline in timothy. Timothy, $2.75@2.80; Hungarian, $1.25; red top, sack, $2.75; Kentucky blue grass, $1.25; red clover, 8½@9½c.; white clover, 25c.; millet, $1.25 orchard grass, $2.25.

Chicago.—WHEAT active; No. 2 Red Winter, 99c@$1.00⅝. No. 2 Chicago Spring, $1.00⅝@$1.00⅞; cash; $1 02 1-8, November; $1.03 5-8, December; No. 3 Chicago Spring, 95c. CORN in fair demand, at 39⅜c@39 7-8c, cash; 40⅜c, November; 41⅛c December; 45⅛@45 5-8c, May. OATS dull at 32½c, bid, cash; 33c, October; 30¼c, bid, November; 30 7-8, December. PORK easier at $18, cash; $12.-47½@$12.50, November; $12 92½, January. LARD steady, with a fair demand at $8.30, cash; $8.15, November; $8.05, January. BUTTER—creamery, 28@31c ₱ lb; good to choice dairy, 23@27c; ladle packed, 17@20; packing stock, 14@16c; grease, 8@10c. CHEESE—We quote:—Full cream, September, 13@13¼c ₱ lb; full cream, August, 12@12½c; part skim, September flat, 12½c; part skim, July and August, 10@11c; full skim, 8@10c; low grades, 6@8c. SEEDS—Timothy was more active and steady at $2.15@$2.33, prime being about $2.30. FLAXSEED advanced about 1c per bu, selling at $1.26⅝ for poor to $1.27@$1.28, the bulk of the business being at the outside. November and January sold at $1.28. The demand for flaxseed is said to be chiefly from parties who have contracts to fill this month. The shipping movement is also large, shippers being anxious to send the seed forward, as freights are advancing and the season of navigation is drawing to a close. Clover seed was quiet at $4.25 @$4 60. WOOL—Good to choice medium tub, 45@48c ₱ lb; coarse or dirty tub, 39@41c; fine unwashed fleece, 20@25c; coarse unwashed fleece, 21@24c; medium washed fleece, 38@41c; fine and coarse washed fleece, 36@38c. HOGS—Market good; strong movement; all heavy firmer; common to good mixed packing, $4.50@$4.70; choice heavy, $4.80@$5.10; light slow and easy at $4.60@$4 80. CATTLE—Market steady and quiet; export steers, $5.20@$5 85; good to choice shipping, $4.60@$4 90; common to medium, $1@$4 35; butchers' active but steady, at $2 20@$3 30; bulls, $2@$2 60; stockers, $2 40@$3.30; Western Texans, $2 85@$3.10; natives, $3.25@$3 a0; through Texans, $2.50@$2.80. SHEEP—Feeders, $3.90; common to choice mlich, $4.25.

Cincinnati.—WHEAT strong; No. 2 Amber, $1.01@1.02; No. 2 red Winter, $1.03. CORN firm; No. 2 mixed, 42@42½c. OATS in good demand; No. 2 mixed, 33½@34c. RYE dull; No. 2, 89½@90c. BARLEY steady; No. 2 Fall, 95c. PORK dull and nominal; jobbing at $17. LARD in fair demand at 8¾c. BULK MEATS dull and lower; Shoulders, 5c.; clear rib, 7¾c. BACON easier; shoulders, 5½c.; clear rib, 8¼c.; clear sides, 9½c. BUTTER—For creamery there is a steady but moderate demand. Fancy creamery sells at 30@31c.; and prime at 28 @29c.; choice dairy at 24@25c.; choice Western Reserve at 22@24c.; prime to choice Central Ohio at 18@20c., and common at 14@16c. ₱ lb. CHEESE—There continues to be a fair consumptive demand for choice mild factory, and it is firm at 13@13½c, ₱ lb, but some prime stock which is a little sharp sells at ¼@½c. less. SEED—The consumptive demand for Timothy is light, but the jobbing prices are steady at $2 55@2.60 ₱ bushel for prime to choice from store, and dealers buy at $2 40 for car lots on arrival. Clover is quiet; dealers buy round lots at 7½c. and small sales are made at 8@8¼c. ₱ lb from store. Dealers buy flaxseed at $1.15 per bushel.

St. Louis.—WHEAT No. 2 Red Fall, $1.02@1.02⅜ cash; $1.02@1.05¼. November; $1.05¼@1.07¼, December; $1.06⅝@$1.07. January; $1.02 bid all the year; No 3 do. 95c.@95¾c; No. 4 do. 90½c@ 91c. CORN lower at 39½c@39¾c., cash; 39⅝c@ 39¾c. November; 39¾c.@39¾c., December; 39¾c. all the year; 44¾c.@45c., May. OATS lower, at 28¾c.@29c. cash; 29½c., November. RYE dull at 82½c. BARLEY 70@85c; PORK jobbing at $15 50. Lard nominal at $8.15. Bulk meats dull; shoulders, $1.95, Clear Rib $7.80; Clear Sides, $8.10. Bacon lower; Shoulders, 5¼c.@5¾c; Clear Rib, $8 50@8. 55. Clear Sides, $8.75. CASTOR BEANS prime at $1.33. BUTTER prices continue weak and drooping, under a very light demand, liberal supply, and discouraging tone of advices from other leading markets. Choice dairy best sustained. We quote; Creamery mainly at 30, selections of choice dairy at 25@26c; medium 16@18c, low 11@14c; near-by country make 10@12c. for poor to 14@16c for good. WOOL—Tub washed—Choice 45c, lamb and fair do 40@44c. dingy and low 38@37c; Unwashed—medium 27@28c; course do 22@24c, merino 16@20c. lamb 23@26c. Kansas 20@25c, well-grown fall clip Texas 22@23c. Burry, black, cotted, etc., 5@15c. less—Southern burry 12½@13c. Sales: Small lots tub at 45c. 3 sks do lamb at 42c. 9 sks. choice Missouri fleece washed at 37c. 12 sks choice Missouri mixed combing unwashed at 29c. HOGS dull; Yorkers and Baltimores, $1.60@4,75; mixed packing, $4.50@4.80; butchers' to fancy, $4 80@5; SEEDS Quiet. Timothy at $2.20 for fair to $2 30 for prime. Clover at $4.70@4.75 nominally; red top at 60c; other seed neglected. Sales; 8 sks timothy at $2.25 at $2.30, 57 redtop at 60c; flaxseed higher and firm, at $1.20@1.21 on basis of pure.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 16, 1880.

BEANS AND PEAS.—Marrow beans steady with a moderate export call. Medium beans quiet; few prime old left. New sell close to arrival as follows: Marrow $1.75; medium, $1.55@1.55; pea, $1.70@1.75; red kidney $1.60. The crop is said to be a full average one.

Old beans, marrow, prime, $1 60@1.62½; other, $1.50 @1.55; mediums, prime, $1.45@1.47½; other $1.35@1.40; pea $1.55@1.60; white kidney, $1.65@1.80; red kidney $1 35@1.45. Green peas have more inquiry; only prime quality asked for; quoted $1.50@1.55; Southern B. E. peas held at $1.75 per 2 bu. bag.

BUTTER.—Trade lacks Fall activity and aside from the finest table marks of creamery and extra half tubs there is quite a yielding feeling in prices. State dairies, the feature of the season, are decidedly slow. When they are limited as to price by country owners negotiation is more or less hampered when a sudden bid is made. It is thought that farmers will carry a large portion of the crop this season as there is no speculative "craze" as there was last season. Shippers are taking good lots; they would operate more largely if sellers could spare what they would pick out at their price, say 25c, for prime choice lines. For Western late made they have filled up pretty well at 19@20c. Western has a good, steady local demand at our figures.

Creamery, fine State, 30@31c.; Western, 29@30c.; good to prime, 27@29c.; poor to fair, 25@26c.; sweet cream, 25@28c.; State entire dairies, choice, 25@26c.; other, 23@24c.; firkins, fair to choice, 22@25c.; State pails and half tubs, fine fresh, 27@28c.; good to prime, 25@26c. fair to poor, 24@25c.; poor, 21@22c.; Welsh tubs, fine, 26@27c.; poor to good, 20@25c.; Western imitation creamery, 20@24c.; dairy, fresh, 22@23c.; poor to good, 16@20c.; factory, June, 18@19c.; current make, 19@20c.; poor to good, 15@18c.

Receipts for week, 25,400 pkgs.; exports do., 13.100 pkgs.

CHEESE.—Receipts have been small while the demand has been very good for choice factories at firmer prices, closing at 13@13¼c., and more generally the outside price made.

State factory, fancy, at 13@13¼c.; do. good and prime, 12¼@12¾c.; do. fair to good, at 11¾@12¼c.; do. h'f skimmed, 10@11c.; Wisconsin factory, fine, 12¼@ 12¾c.; do. good to prime, 12@12¼c.; do. fair to good, 10¾@12c.; Ohio factory, fine, 12¼@12¾c.; do. good to prime, 11¾@12c.; do. flat, fair to good, 10¾@11¼c.; do. poor to fair 7@10c.

Receipts for week, 37,160 boxes.
Exports for the week, 38,600 boxes.
Liverpool cable, 66s. 6d.
Steam to Gt. Britain, 35@45s.

COTTON.—There has been less life to the market, but prices are firm. Latest prices are for

October at 10.74@10.76c.; November at 10.75@ 10.76c.; December at 10.81@10.82c.; January at 10.96@ 10.97c.; February at 11.12@11.13c.; March at 11.28@ 11.29c.; April, 11.43@11.45c.; May, 11.58@11.60c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Receipts for week, 31,965 bales. Exports do., 10,980 bales.

DRIED FRUITS.—Apples have a moderate inquiry and prices generally steady. Peaches are quiet and unchanged. Small fruits are held firm.

Apples—Old State at 5@6c., new Tennessee at 3½@4c.; new Virginia at 4@5c.; fancy sliced North Carolina at 6@7c.; evaporated, ring cut, at 8½@9c. Old peeled peaches at 8@14c. Blackberries at 7½@8c.; Raspberries at 25@26c. Pitted cherries at 19@ 20c. Whortleberries at 11c. New Georgia peeled peaches at 16@17c.; new North Carolina peeled peaches at 18@20c.; new unpeeled peaches, quarters at 7@7½c.; new unpeeled peaches, halves at 7½@8c.

Receipts for week, all kinds, 4 607 pkgs.
Exports for week, 720 bbls. of dried apples.

EGGS.—Receipts for the week, 7 200 pkgs.; do last week, 8,200 do. With continued light supplies the market is firm and high for prime marks. It is thought that stored or ice house eggs have hurt the demand, still they will be the only lots that can be offered to cheap buyers until limed are more of a feature.

State limed 18@18½c.; Western 17½@18c; near points fresh 24@25c.; State and Pa. 22½@23; Western and Canadian, fresh, 22½@23c.; seconds, 20@21c.

FEED.—Sales are at $17.50@18.50 for 40 to 60 lbs., $18.50@19.50 for 80 lbs.; $19@21 for 100 lbs.

FLOUR.—Demand has been brisk from exporters and home trade buyers, and prices have tended higher.

Latest prices are: $3.50@4.10, for very inferior to very fancy superfine State and Western; $4.20@4 40 for poor to choice extra State and Western, odd lots and lines; $4 40@4 60 for choice to fancy do.; very inferior to good white wheat, trade and family extras, $4.90 @5.75; good to choice do. at $5.75@6.35; (very choice to fancy do. at $6.50@6.75;) red and amber winter wheat inferior to choice trade and family, at $4.70@6.25; round hoop Ohio, $4.65@5.15; and trade and family brands of do, at $5.25@6 35; St. Louis at $4 90@5.85 for inferior to good extra; $5 85@6.35 for good to choice (and $6.35@6.75 for choice to very fancy brands); Minnesota clear, inferior to fancy at $4 20@6.50; Minnesota "straight," poor to fancy, at $5 85@7.25, and patent inferior to very fancy at $5.75 @8.75; unsound stock at from $2 50@5.00; city mill extra at $5.50@5.85 for ordinary to fancy for the West Indies; do. for England, $4 20@4.60 for poor to choice spring wheat, and $4.85@5.40 for winter wheat product; do. trade and family extras, $5.60@7.00; do. for South America, $5.70@6.00.; No. 2 at $2.70@3 65 for very poor to very fancy.

Receipts for week, flour, bbls. 108,675; corn meal, do. 3,050; wheat, bush. 1,165,100; corn, do. 1,129,150; oats do. 86,100; rye, do. 83,800; malt, do. 45,200; barley, do. 206,800; beans, do., 7,230; rice, pkgs. 1,750.

Exports for the week, flour, bbls., 74,800; corn meal, do. 2,550; wheat, bush. 2,042,700; corn, do, 1,475,000; oats, do. 7,124; peas, do. 5,300; beans, do. 406; rice, 1,200

CORN MEAL.—Sales at $3.60@3 for Western, and $3.35@3.40 for Brandywine.

FRESH FRUITS.—There is a degree of better feeling in apples, but trade is not working up to the supply. Quality is now very fine and many good holding lots are in. There is no promise of much advance. Newtown pippins are selling near-by orchards at $1.25@1.50 per bbl., buyers supplying cooperage.

Western mixed, $1.25@1.87; Baldwins $1.25@1.50 in shipping order. Greenings, $1@1.12. Kings, Fall pippins and 20-oz., $1.25@1.50; open heads, 50@75c.; exports are large and are being widely distributed abroad. Cranberries dull and weak; fancy Cape Cod, $5.50@6; poor to good, $3@4.50; boxes, $1.75@1 87; N. J., $1@1.50. Quinces are cheap; best, $5 per bbl.; others, $2.50@4. Pears are scarce; California and Mass. boxes firm at $4@6; Duchess, Beurre Bosc and B. Clarigeau, Duchess in bbls., $5@6; Lawrence, $4@ 5; Beurre d'Anjou, $5@6; Vicars, $5@5. Florida lemons, $3@3.50 per box. La. oranges, $4@5 per bbl. Chestnuts plenty at $2.25@3 per bush. of 60 lbs. Hickory nuts, new, $2@2.25 per bush. of 50 lbs.; do not mix old with new. Peanuts quiet, hand-picked Va., $5@5½c.; extra prime, 4@4½c.; good to prime, 3½@4c.; shelled, 5¼@5½c. Quality generally superior to former seasons, Va. leading. Small uniform bags are most desirable; the Virginia standard is 66 inches and is best liked by the trade here and West.

GRAIN.—Wheat has been active and advancing; the exports for the week reach 2,000,000 bush.

The latest prices are for No. 1 white at $1.17@1.18¾; do. for October, at $1.17@1.17¾; do. for November at $1.16¾@1.17¼; do. December at $1.18@1.18¾; No. 2 white at $1.15@1.16¼; ungraded white at $1.12¼@1.20; mixed winter at $1.16 No. 1 red at $1.20@1 22; No. 2 red at $1.13@1.20; do. October, at $1.17¾@1.19¼; do. November, at $1.17¾@1.19½; December, at $1.18¾@ 1.20½; do. January, at $1.19@1.21; do. steamer grade at $1.15@1.15¾, No. 3 red at $1.15@1.17; do. steamer grade at $1.09; ungraded red at $1.05@1.22; No. 2 Chicago spring at $1.15¾; ungraded at 95c. Rye at 1.02@ 1 05. Corn is higher and strong and active; latest sales are of New York No. 2, regular inspection, at 55@55¾c.; do., October, at 55¾@55¾c.; do., November, at 55@55¾c.; do., December at 55¾@55¾; ungraded mixed Western at 55@55¾c.; No. 2 white, in store, at 57c. Oats are active and at better prices; latest sales are of No. 1 white at 45@45½c.; New York No. 2 white at 41@41½c.; No. 3 white 39@39½c.; New York No. 1 at 40c.; New York No. 2 at 39¾@40c.; do., October, at 39¼@39¾c.; do. November at 39¾@40c.; do., December at 40½c. bid; No. 3 at 38¾@39½c.; ungraded white Western at 40@45c.; ungraded mixed Western at 38¾@40c.; mixed State at 41c.

HAY AND STRAW.—Demand is active and price firm; receipts are very moderate.

Shipping hay is at 85c.; medium to prime do., 95c.@$1.15; salt hay at 60@65c.; clover do. at 65@75c. Straw at 95c.@$1.05 for long rye; 70@75c. for short rye; and 65@75c. for oat.

Exports for the week, 1,250 bales.

HOPS.—There is more doing in small lots on wants of brewers, and prices generally steady. Quotations are for

	Cents per ₱.

Pacific coast, new	none
Pacific coast olds (nominal)	nominal

HONEY.—The demand is mainly for a few single boxes for store decoration. A wholesale owner would meet concessions.

White clover comb, single pkgs, 17@18c.; larger pkgs 15@16c.; buckwheat 12@13c.; extracted, dark to white, 5@12c.

OIL CAKE.—Western is active and quoted $32 per ton.

POULTRY AND GAME.—Dressed poultry has a fair demand for prime. Prices good as ice expenses are now diminished. Parcels from remote points should still be ice-packed.

Turkeys, State and Western, choice, 13@13½c., ₱ ₱.; fair to good, 12@12½c; Phila., dry-picked, 14@15c. Chickens, do., 15@17c.; Bucks Co. do. 18@19c.; State scalded, 13@14c.; Western, scalded, 12@13c. Fowls, Phila., dry-picked, 14c.; N. J., d.-p., 13@14c.; scalded 13@14c.; State, scalded, 12@13c; Western, scalded, 12 @13c.; poor to fair, 10@11c. Ducks, Spring 16@18c.; mixed, 10@14c. Geese, Phila. 11@13c.; fair to good, 8@10c. Squabs, white, ₱ doz., $3.50; dark, $1.25@1.50.

Live poultry has sold well under free receipts. Ducks and turkeys run poor.

Chickens, New Jersey, per ₱ 12@12½c.; State, and Penn. 11@12c; Western, 10@11c.; Southern, 10@11c. Fowls, New Jersey, 12c.; State and Penn. 11@12c. Western, 11@11½c.; Southern, 10@11c. Roosters, 5@6c, Turkeys, N. J. 10@12c.; Western 9@10c. Ducks, choice, ₱ pair 75@87c.; other, 45@55c. Geese, choice, $1.75; other, $1@1.50.

When game has the good fortune to arrive dry sales are quick; wet or soft birds drag. Venison not plenty and not much wanted: a few State deer till special wants.

Mallard ducks, 50@60c.; teal, 30@40c.; common 20@ 30c.; partridge, prime, 90c.@$1 00; eastern, 50@60c.; soft, 20@30c.; grouse, prime, 30c.@$1; soft, 25@30c.; woodcock, State, 65@75c.; Western, 40@60c.; Eng. snipe, ₱ doz., $1.50@1.75c; Sand snipe, 40@50c, plover, $1.50@1.75; wild pigeons, still-fed, $.50@1.75c.; flight $1@1.25; Venison saddle, 15@18c.; whole deer, 11@12c.

PROVISIONS.—Hog products have been active and advancing.

Mess pork at $16, for spot lots. Bacon at 8-30c. for long clear, and 8¾c. for short clear. Lard—Western steam at 8.77½@8.80 for spot lots; 8.75@8.77½c. for Oct; 8.70 for Nov., and 8 55c. for Dec. and Jan. Stearine at 9@9½c. Tallow at 6¼@6 5-16c. Beef hams at $15.50. Beef—India mess $19@20 for city; $9.50@10 for extra mess and $9 00 for plain mess $11@11.75. for packet, and $13@13.25 for family mess.

Receipts for week, beef, 1,035 pkgs.; pork, 5,200 bbls.; cut meats, 26,450 pkgs.; lard, 25,300 pkgs.

Exports for week, beef, 2,500 bbls.; pork, 4,650 bbls.; cutmeats, 6,467,653 lbs.; lard, 4,101,700 lbs.

SEED.—Clover is steady; quoted at 8¼@9c. Timothy is firm at $2.70@2.80.

Receipts for week, 1,806 bushels.
Exports for week, 800 bags.

TOBACCO.—There has been a liberal demand for export and the market closed firm at the prices quoted.

WOOL.—There has been a very fair trade this week, manufacturers showing more interest and prices have ruled steady and unchanged.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Oct. 16, 1880.

BEEVES.—Receipts for the week 13,324 head; do. last week, 12,115 do. The closing sales show a decline of ¼c. compared with Wednesday—the test day of the market. Heavy receipts are looked for next week and buyers whose wants were not urgent with the present warm portions of the week bought only sparingly. There was a large number of natives on sale and these showed the most decline. Texas and Colorados quoted 7@8¼c. to dress 55 lbs.; some Indian native stock 7¼c.; Va. dry cows and heifers 6¼c.; poor to fair native steers 7½@9c. to dress 55@56 lbs.; good to choice 9¼@10¼c, to dress 56 @57 lbs. a few fancy 10¾@11¼c.

COWS AND CALVES.—Supplies are small compared with former seasons, but there seems to be no urgent demand as recent prices continue full. Common, but useful to prime heads $30@55, with an occasional selection $60.

VEAL CALVES.—Good market sizes of live or dressed have had a steady sale; the latter must be strictly prime at 11c.

Live calves, N. J., fed, 7¼c., State 7@7½c.; fair to good, 6@7c.; poor, 5@5½c.; Mt Holly, 5@7½c.; buttermilk, 3½@4c.; grassers, 2¾@3½c.; dressed choice fed, 11c.; fair to prime 8@10¾c.; common 3¾@6c.

SHEEP AND LAMBS.—Receipts for week, 37,414 head; do last week, 33,316 do. There has been a steady trade during the week, market closing somewhat slow. Sheep 4@5¼c.; common to prime lambs 5@6¼c; a few state $6.20 per 100 lbs.

SWINE.—Receipts for the week, 32,944 head; do. last week, 31,675 do. A decline in the West and warm weather here causes a quiet market; best rate at close $5.30. Live hogs $5.30@5.31 per 100 lbs.; corn-fed dressed N. J. pigs heavy 6¾@7c.; light 8@8¾c.; do. State 6½@8¾c.; city dressed 6¾@7c. Western.

LANDS AND HOMES IN SOUTHWEST MISSOURI.
1,000,000 acres well-watered Timber and Prairie Lands along the line of the St. Louis and San Francisco R. R. for sale at from $2.50 to $8.00 per acre *on seven years' time.* Excellent for Stock, Fruit, and Farming. The best Tobacco Region in the West. Short winters, convenient markets, superior schools, low taxes, healthful climate, good society. Free transportation from St. Louis to purchasers of land. *Send for maps and circulars.*
W. H. COFFIN, Land Commissioner, Temple Building, St. Louis, Mo.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high standing and trustworthiness.

NEW PREMIUM CORN SHELLER.

ONLY $1
Sent by mail postpaid on receipt of price.

Cannot get out of order. Will last a lifetime.

This is the only Cheap Practical Hand Corn Sheller in the market and is in every way the

EST HAND CORN SHELLER EVER INVENTED.

Shells 25 to 30 bushels a day **very easily.** Is especially recommended to farmers who shell large quantities of corn for seed. It has been customary to remove the imperfect kernels from both ends of the ear with the hand, and use the full, perfect kernels of the center for seed. This is a long, tedious process, but with this sheller it can be done in one-tenth the time. To poultrymen, to seedsmen and to anybody who shells corn, we recommend it. Can be carried in the pocket and samples of corn taken from any part of the field by shelling only part of an ear.

Our PREMIUM CORN SHELLER is destined to become the **Leading Hand Corn Sheller** of the day, and you will find it profitable and to your advantage to secure the sale of it. When it is once introduced no other small sheller will be wanted in your locality. This Sheller opens a new field for reliable agents. A very profitable business can be done upon a small capital.

Believing this to be the Best Low Priced Corn Sheller ever invented we have secured the General Agency for the United States, and we want

CANVASSING AND LOCAL AGENTS IN EVERY COUNTY.

Sample sheller and price list sent prepaid to any address upon receipt of $1.
Address all orders to Publishers of

Reading for the Young.

SWING, ROCKER, SWING.

LITTLE EVIE'S GOOD-NIGHT SONG.

The evening hour is creeping on,
Swing, rocker, swing;
The play-day time is almost done,
Sing, baby, sing.

Oh, Evie sits on mamma's knee,
Swing, rocker, swing,
A happy little boy is he,
Sing, birdie, sing.

The fire-light glows upon the wall,
Swing, rocker, swing;
While evening shadows cover all,
Sing, baby, sing.

Through the window pane he sees,
Swing, rocker, swing,
The witches dancing merrily,
Sing, birdie, sing.

Their bonfires burning clear and bright,
Swing, rocker, swing,
While happy, dancing in the light,
Sing, baby, sing.

Oh, baby's eyes must go to sleep,
Swing, rocker, swing;
Of infant dreams drink long and deep,
Sing, birdie, sing.

Oh, colder grows the Winter night,
Swing, rocker, swing:
While witches dance by window light,
Swing, rocker, swing.

—MAUDE MEREDITH.

THE BLUE JAY.
Corvus Cristatus.

This elegant bird, which seems to be peculiar to North America, is distinguished as a kind of beau among the feathered tenants of our groves and forests, by the brilliancy of his dress, the oddness of tone and gesture, and his superabundant loquacity. He is, indeed, a gay fellow, large and strong, measuring eleven inches in length, and, as his name would indicate, of a most beautiful blue color interspersed with markings of black and white in striking and artistic fashion. His head is ornamented with a crest of light blue or purple feathers, which he can elevate or depress at pleasure, giving the jay its jaunty, defiant air. A collar of black passes around the neck in graceful curves, and forms a crescent on the upper part of the breast. Chin, cheeks, and breast white; greater wing-coverts a rich blue; exterior sides of the primaries light blue; those of secondaries a deep purple, except the three next the body which are a splendid light blue. All these, except the primaries, are beautifully barred with crescents of black and tipped with white, tail feathers also marked with traverse curves of black and tipped with white.

When in the early Spring every thicket pours forth its harmony, the shrill call of the jay sings out conspicuously. He appears to be among his fellow-musicians what a trumpeter is to a band, some of his shrill notes somewhat resembling that instrument, yet, at will, he can imitate the song of almost any other bird, and whether his shrill cat-squall is an imitation of the cat-bird, or only one of the varied expressions of his own peevishness, I could never quite determine. For, like many people, the jay is subject to great rise and fall in his emotional mercury; at one moment in the highth of bliss chattering softly, very like a duck, to his sweetheart in the cedar, but, instantly he discovers your approach, he flies off screaming furiously, as though he called all the feathered kingdom to chronicle the insults heaped upon him.

The Blue Jay builds a large nest; frequently in cedar, sometimes but not often, in an apple-tree, lines it with dry fiberous roots, and lays five eggs of a dull olive, spotted with brown. The male is very careful never to be heard near the nest, but makes his visits as quietly and secretly as possible, to avoid attracting attention.

The chief employment of the Jay through the Autumn is foraging to supply their winter stores and as they are very fond of chestnuts and acorns, corn and all hard seed vegetables, with seeds of forest trees, they act the part of useful agents in disseminating these seeds, by dropping a part of their gleanings as they cross fields and alight on fences and hedge rows, to deposit their stores.

Wherever the Jay has had the advantage of education from man, he not only shows his aptness as a scholar, but his suavity of manners is only equaled by his art and contrivance and it must be confessed that his disposition for thieving fully keeps pace with his other acquirements. A lady friend became somehow possessed of a young Jay which she kept and tamed, teaching him many tricks. He was given the name of "Ted" to which he would answer with the most cheerful alacrity, showing the greatest evidence of pleasure when petted and praised. If bothered by visitors he would rush to Mrs. D. with ruffled plumage and the most laughable cat-like cries. But "blood will tell" and though Mrs. D. became greatly attached to her pet, yet he sometimes proved an annoyance by his passion for theft. If she laid down her thimble a moment Ted's bright eyes discovered it, and tipping his head with a serio-comic look, he straightway deposited it in some out of the way nook or corner, the pedal, of the sewing machine being his chosen place, and any article too large to be driven through the iron belting, was industriously hammered and pounded with his strong bill, by the hour.

If caught thieving about the farmer's barns or corn-fields, the Jay darts noiselessly away, as though conscious of his crime and detection.

But the jay hunter imitating the call will draw about him numbers of jays, and, if sharp and wary, is sure of his aim.

These birds seldom associate in any considerable numbers, except in September and October, when they visit, in flocks numbering from a dozen to 40 to 50, the groves of oak in search of their favorite acorns, and, right here let me say, where there are oak forests, there will also be a great profusion of jays, and one can hardly imagine the pleasure to be derived for an idle hour spent in watching these bird-theatricals. I have in mind a hammock swung between two oaks in a grove by the side of the Mississippi river, where as the early autumn days come, flocks of these brilliant saucy fellows darted in and out, chattering, fluttering their brilliant colors about the dark green of the glistening oak leaves; holding a brown acorn so firmly and closely to the limb with one foot, while with the sharp bill they cut the soft shell, and devoured the meat, and if by chance a piece fell to the ground the birds would drop after it so suddenly as to give one the impression that they had fallen dead, and all the time utterly indifferent to the hammock and its occupant, evidently considering them a friend and admirer, or of too little consequence to be afraid of. Blue jays are more numerous in the West, probably because of their fondness for acorns.

As a mark against the jay I am sorry to admit that it is universally believed that this brave handsome fellow sometimes so demeans himself as to rob the nests of other birds; but I will not say he does do it, for, through our orchard and the oaks surrounding it, were scattered nests of many other birds, which the jays never seemed to "molest or make afraid," but we all lived together like a happy family, in perfect harmony.

MAUDE MEREDITH.

A NEW PUZZLE CRAZE.

"HAVING already reduced myself to a condition of almost helpless idiocy by attempting to solve the fifteen puzzle, my mind has finally collapsed under the following one, which has been furnished to a New Hampshire newspaper by 'a gentleman of our city,' who claims that it is a complete mind-wrecker:

A
A
A

B
B
B

'The object of the puzzle,' says the gentleman, 'is to place three articles of a kind on the lines marked A and three of a kind on the B lines, with a blank line between. Take, for instance, silver and gold coins. Place the silver coins on the A lines and the gold pieces on the B. Now change the gold pieces to the A lines, and vice versa, by advancing directly forward, either moving to the next unoccupied lines or jumping a coin over one other (and only one other at a time) of the opposite kind. Continue until the silver and gold coins have changed places and are in regular order, one above the other. There can be no retreating—the moves must all be made forward."

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—My Dolly Dutton corn and Surprise Musk-melon are treasures, and when on the table each person seems to try to see which would praise them most. Last year the pigs destroyed nearly all the corn, but left me a poor little ear or two, which I planted last Spring and every kernel came up, I guess, and there were so many ears on each stalk, and it was so early and sweet, all were praising it. I have saved plenty of seed for next year. The musk-melon, our folks say, is rightly named; it is so beautiful when cut, and so delicious to eat. I do not like musk-melon. I didn't have a very good place for them, only three plants came up. I planted them between some potatoes, but as soon as I could I pulled out the potatoes, and put some manure around my plants and watered them through the dry weather, they grew fast, and had a few melons. We have had but two, but my mother has thrown away all the seed she had saved of other kinds and we are going to raise none but these another year. I planted part of the okra seeds and they came up; but one morning I went out to see them and they were gone. I guess the chickens must have eaten them up. I will try them again next year. My pinks are just lovely yet, and phlox and mignonette are too pretty and sweet entirely for frost to kill. I want to thank you again for your kindness.

From your niece, BERTHA H.

Orange Co., N. Y.

DEAR UNCLE MARK AND RURAL COUSINS:—I don't know whether I am a cousin or not, as I never wrote to the RURAL before, but my papa takes the RURAL and my ma sends there for seeds. Now I have just thought why can't I send to the RURAL for a name for my little baby sister, she is six months old, but she has no name, so I am going to ask the cousins to propose some names to choose from. She is fat and fair and has dark blue eyes. I think she is quite old enough to be one of the cousins, for she likes flowers, and I must teach her gardening as soon as she is old enough. I wish the cousins would send in the names soon, and Uncle Mark, may be you have some nice ones to propose? I am twelve years old and go to school. I am going to watch the RURAL to see when to send for the seeds it is going to offer. I wish I could get some of the magnolia seeds of last year for I want a grand, old magnolia tree some day, and want a seed to start it from. I must stop or this will go into the waste basket, and then baby will get no name. Your affectionate niece,

Seneca Co., Ohio. MARY B. WALKER.

UNCLE MARK:—My mama takes the RURAL. She thinks it is a splendid paper and I love to read it especially the letters from the cousins; I am a little girl eleven years of age, and I have a little sister nine years old, her name is Violet, we both want to join the Horticultural Club, even mama says she would like to be one of the cousins, but she is afraid Uncle Mark don't take such old people as sho. I love flowers dearly, we live in the country, but we have no home to call our own, for my papa is very poor. Sister and I raised $10 worth of chickens last year, this year we only raised a few. I go to school, study arithmetic, geography, grammar, writing and spelling, and read in the fifth reader. Now, Uncle Mark, I wish you would remember me when you pass the seeds around, and I will try and do the best I can with them. From your new cousins,

MAUDIE and VIOLET TERRY.

Prophetstown, Ill.

DEAR UNCLE MARK:—I had splendid success with my seeds, which you sent me. I sowed the pinks in a box and have twenty plants in blossom. The rest were sown in the beds and are very pretty. The hollyhocks, which we received in 1879, delighted us all with their beautiful flowers. We live about five miles from the city of London, Ont. Pa has two large fish-ponds, in which are a great number of trout. I had almost forgotten my grape vines. We sowed the seed in a box directly after receiving it. It staid about a month without making its appearance, when we put it out of doors. About the middle of May I wanted to put some slips in this box and found two vines, which are about eight inches high now.

Your loving niece, SADIE B. VINING.

DEAR UNCLE MARK:—The seeds you sent us grew finely all of them, except the okra, which by mistake was plowed up by the hired man when two inches high. The melon bugs were determined to take all of our vines, but we saved a few. The Surprise is the most delicious musk melon I ever ate. We had beautiful phlox and portulaca all colors, splendid double pinks, fine variegated coxcomb and a nice bed of mignonette, besides many other flowers. Frank's radishes were very fine from seed you sent last year, but his corn did not fill well as it was planted in a row apart from other corn. Two of his grape seeds came up. Thanking you very much. M. NELLIE B.

Cedar Mills, Minn.

DEAR UNCLE MARK:—I want to thank you for the seed you sent me. I planted them late in an open bed and all did well except my pinks; they came up well but did not grow well, they have had two blossoms on them. My phlox and portulacas have been beautiful all Summer. My favorite of my phlox was a pale buff one. I did not save any seed of my musk melons. I planted them and the vines were very nice, but they did not bear. Melons of all kinds in this country were nearly a complete failure this year. Uncle Mark, I am very much obliged to the cousins for writing to me. I have enjoyed their letters so much. From your niece, ALMA ALLEN.

Russellville, Ala.

DEAR UNCLE MARK:—I deserve to have my name stricken from the cousins list for not having written before. I received the seeds you sent me and thank you very much for them. I planted the phlox and pink seeds in a box soon after their receipt, and transplanted them to the garden as directed, the pinks are the most beautiful I have ever seen, the most of them being double. The phlox have been in blossom for over two months and are very pretty. The coxcomb and mignonette look very nicely; the portulacas are very handsome, they are of different colors from my others, there being some white ones among them.

Your nephew, BURTON D. NILES,

Sherburne, Chenango Co., N. Y.

DEAR UNCLE MARK:—I am a little girl twelve years old, I would like to join the Horticultural Club. This is the first year my father has taken the RURAL, and we all like it very much. The seeds my father received from the RURAL did not all come up. The mangolds did not amount to anything. I would like to send that cousin in Iowa a stone from Illinois if she will pay the postage, as I have quite a collection. From your niece, FRANKIE NOBLE.

Mt. Carroll, Ill.

DEAR UNCLE MARK:—My father has been taking the RURAL for 13 years so you see we are old friends, in fact, I was about two years old when my father first took it. Will Uncle Mark and the Cousins receive me as a member of the club? I do not see any boy's letter from this part of the country. I hope not to be forgotten in the free seed distribution. I am truly yours.

Dallas, Texas. MICHAEL J. REVERCHON.

DEAR UNCLE MARK:—My papa takes the RURAL and he reads me the cousin's letters. I would like to join your club if you will let me. I go to school every day; I have got a dog, kitten, and some flowers. I like to hoe in the garden. I hoed all the Cow-peas you sent with the RURAL. I am five years old and have one brother. Your nephew,

Nova Scotia. IRA LEE DEARMOND.

DEAR UNCLE MARK:—I am a little boy thirteen years old and would like to join your RURAL Club. Mother has some Iris plants which please tell her how to care for this Fall.

Taylor Co., Iowa. Truly, WILLIE WINKLEY.

[The Iris is perfectly hardy and requires no protection during the Winter, although a coarse mulch benefits plants of all kinds.—U. M.]

UNCLE MARK:—I would like to join the Horticultural Club. I am very much interested in the culture of flowers and vegetables, and have a few beautiful plants that are blossoming beautifully. I would like to have many flowers, but do not have time to care for them. Yours very truly,

East Randolph, N. Y. LITTLE BEAR.

DEAR UNCLE MARK AND COUSINS:—I am 14 years of age. I am very much interested in the Cousins' letters, and have often thought I would write too. We have several kinds of flowers, asters balsams, pinks, pansies, petunias, zinnias and several other kinds. ELLA PATRICK.

Jefferson Co., N. Y.

Sabbath Reading.

KINDNESS.

KINDNESS light of pleasure lends,
When pale Grief her shadow sends
O'er the soul;
When the storms of life defy,
When the loud waves sweep on high,
'Twill console.

It will comfort, heal, and soothe,
By its soft caresses move
Our heart's pain,
As the kiss of evening showers
Bids the Summer's drooping flowers
Smile again.

Simple, small, its acts may be,
A kindly word in charity,
A look of love.
Or wide in sympathy, each one
Angels love to look upon
From above.

As the sunbeam carries light,
Life and beauty in its flight
Thro' the air;
So, true kindness from the heart
Doth perform a sunbeam's part
Everywhere.

"OF SUCH IS THE KINGDOM OF HEAVEN."

A BLIND old beggar, with his hat in his hand,
Neglected by the passers-by,
I noticed shyly at the corner stand,
With moisture falling from his sightless eye;
A child came by—a laughing little creature—
With joy and innocence in every feature,
Skipping forth gaily to the apple stand.
She saw the beggar and became less gay;
Then flung the bit of silver in her hand
Into the old man's hat and ran away.

PLYMOUTH ROCK.

OF all spots on the American continent Plymouth Rock is, religiously and historically, the most interesting and sacred. Here is the source and spring of America's greatness, the beginning and the basis of her history. Plymouth Rock, the memorable landing-place of the Pilgrims is covered with a massive granite canopy, in the upper part of which are deposited the bones, gathered from the neighboring hill, of several who died during the first year. The place will ever be regarded with interest as holy ground by their descendants all over the States, and indeed by all lovers of Christian freedom.

Pilgrim Hall, in front of which is a portion of the rock on which the Pilgrims landed, contains a museum of relics of the "Mayflower." Here, among other things, is a copy of the Indian Bible, translated by John Eliot, the apostle to the Indians, who arrived in 1630 learned the Indian language, reduced it to writing, translated the whole Bible into it, wrote the whole, it is said, with one pen, and had it printed and published by the year 1661. It was the first Bible printed in America. A copy was sent to Charles II., and Richard Baxter says of it, "Such a work and fruit of a plantation was never before presented unto a king." The marvel is all the greater when we recollect that the Indians at the outset were hostile to the settlers. Eliot went among them, showed them kindness, won the good-will of some, became their friends and sought their protection during Philip's war in 1675. The language, however, of his version is extinct, and only one person now living can read it.

Burying Hill commands an extensive view, and was an outpost of defence in the early days of the settlement. Here are the graves of William Bradford the Governor, Miles Standish, and others.

The fairest and most durable memorial, however, of the Pilgrim Fathers is the civil and religious liberty of the United States.

"Aye, call it holy ground,
The soil where first they trod,
They left unstained what there they found,
Freedom to worship God."

MANY people wonder why the Old Testament has been handed down to us; why it did not perish with the generations for which it was written. There are great highways in the Bible through which one may go and gather the great fundamental truths; there are also the by-paths, the canons, and gulches, and mountain fastnesses where one can find truths and beauties of the rarest and most precious kind. As the gold is hidden in the quartz, and the diamond in the sand, so God has hidden in the unattractive portions of the Scriptures some of the richest treasures to reward those who have the patience to seek and dig them out.—P. S. Henson.

THE preacher's words had power because they accorded with his thoughts, had reality and depth, because they harmonized with the life he had always lived. It was not mere breath that this preacher uttered; they were the words of life, because a life of good deeds and holy love was melted into them. Pearls pure and rich had been dissolved into the precious draught.—Hawthorne.

THE characters of Christians differ. It is the peculiarity of the life of the Saviour to impart different gifts, and a different selection of gifts to different believers, so that while all have a family likeness to the Master, yet they are not "like to like," but "like in difference."—Charles Butcher, D. D.

IF thy thoughts should, like the laborious bee go over the world from flower to flower, from creature to creature, they would bring thee no honey or sweetness home, save what they gathered from their relations to eternity.—Richard Baxter.

PERSONAL ITEMS.

Mr. Peter Cooper, is now 91 years old.

Mr. Whittier says: "I am out-of-doors a great deal, and in Summer take long walks. I still write when I feel like it, but have no regular habits of work, I read a great deal, but am beginning to have trouble with my eyes. My health is good."

General Hancock says that he has had only one application for office as yet, and that was from a man who wished to go as Minister to Corea. He had understood that every white man, on landing there, had his head taken, and he desired the operation performed on himself.

The Ex-Empress Eugenie has purchased the Farnborough estate, in Hampshire, from the widow of the late Thomas Longman, the publisher, for £50,000. It comprises some two hundred and fifty acres of finely-wooded grounds. The Empress intends to build on the property a mortuary chapel to receive the remains of the late Emperor and the Prince Imperial.

The following twenty men are estimated to be worth the sums following their names:

William H. Vanderbilt	$100,000,000
Astor, of New York	75,000,000
Jay Gould	75,000,000
Russell Sage	75,000,000
Fair, of California	50,000,000
Flood, of California	50,000,000
Mackie, of California	50,000,000
August Belmont	30,000,000
James G. Bennett	30,000,000
S. J. Tilden	25,000,000
Edward Clark	25,000,000
Keene, of New York	20,000,000
Peter Cooper	20,000,000
Senator Jones	20,000,000
Solon Humphreys	15,000,000
Sidney Dillon	15,000,000
Oakes Ames, Jr.	15,000,000
Perry H. Smith, of Chicago	15,000,000
Pierre Lorillard	15,000,000
Senator Sharon	15,000,000

Business and Professional Men,

and all who, in consequence of overwork, find themselves suffering from a gradually increasing brain and nervous exhaustion, and who feel that they are slowly losing vitality and the power to do their best, and that a breakdown in the near future is almost inevitable, will find in Compound Oxygen a new agent of cure and restoration, *which acts as a revitalizer*—and with this a promptness that at once stops the downward drift. The paralysis which so often arrests the steps of business men and hard brain-workers after they have passed middle life, might in most cases be prevented by an occasional use of this revitalizing agent. Our Treatise on Compound Oxygen, its Nature and Action, is sent free. Address Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

Implements and Machinery.

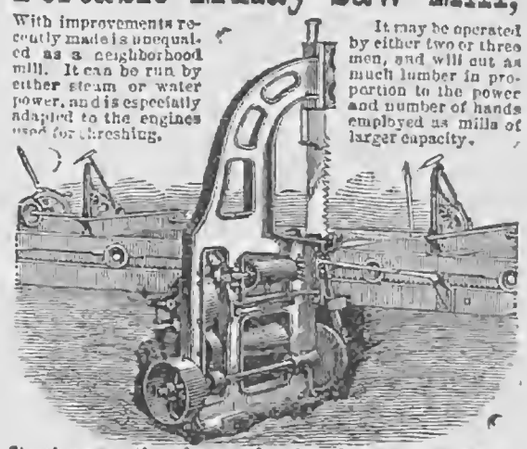
Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.



It makes smooth and even lumber, leaves no stubshot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc., to CHANDLER & TAYLOR, Indianapolis, Ind.

Humorous.

MRS. THEODORE COOK of Utica pays her respects to the Japanese fan in the last number of St. Nicholas, as follows:—

There lives in the land of Japan
A very lugubrious man,
Who sketches with toil,
In water and oil,
Strange scenes for the Japanese fan.

He paints with the Chinaman's queue,
And uses vermilion and blue;
He delights in large herds
Of long-legged birds,
Which he makes with their bodies askew.

He strives with the noble intent
To picture each current event;
He often spends hours
Over intricate flowers,
And receives just the eighth of a cent.

A COMPOSITOR who cannot agree with his wife says he must have taken her out of the wrong font.—Puck.

"BRIDGET, the dust upon the furniture is intolerable. What shall I do?" "Do I do mar'm, pay no attention to it."

LIVES of grocerymen remind us
They can make their starch half lime,
And with sugar wholly blind us,
Putting sand in all the time.

"YOU can't play that on me!" said the piano to the amateur who broke down on a difficult piece of music.

WE are told that the doctors are daily discovering new diseases. Let's abolish the profession.—Boston Post.

A little girl sent out to hunt eggs came back unsuccessful, complaining that "lots of hens were standing round doing nothing."

COLLECTOR.—How many times do you wish me to call for this money? Debtor—My dear sir, you need never call again. I shall not be offended.

GEORGIE (four years old) at the tea table—"Mamma, may I have some sardines?" Mamma—"Wait till I'm ready, Georgie." Georgie (surprised)—"Why, ma, it's me that wants 'em!"

A YOUNG man on Main street says he is going to attempt the feat of going forty days without working. He says if his employers do not watch him, he thinks he can accomplish the task.—Rockland Courier.

"Can dogs find their way home from a long distance?" says an exchange. It's according to the dog. If it's one you want to get rid of, he can find his way home from California. If it's a good one, he's apt to get lost if he goes around the corner.

A LITTLE girl once said that she would be very glad to go to heaven, because they had plenty of preserves there. On being cross-examined, she took down her catechism and triumphantly read: "Why ought the saints to love God? Answer: "Because He makes, preserves, and keeps them."

"ANY good shooting on your farm?" asked the hunter of the farmer. "Splendid," replied the agriculturist, "There's a lightning-rod man down in the clover meadow, a cloth peddler at the house, a book agent out in the barn and two tramps down in the stock yard. Climb right over the fence, young man, load both barrels and sail in."—Hawkeye.

The Tide of Emigration

To the great West seems always at the flood. As the great forests are swept away, and settlements are established along the streams of that vast region, an enemy obtrudes himself among the homes of the settlers, scarcely less to be dreaded than the barbarous Indian. Fever and ague scourges those new communities, and it is only by the use of an efficient preventive that its malarious breath can safely be inhaled. Hostetter's Stomach Bitters, a fortifying and protective medicine, without a rival on this continent, has for over a quarter of a century been the chief resource of the new settler, the miner and agriculturists of the West in time of sickness, his surest safeguard against the inroads of disease. This medicine, besides being an antidote to malaria, counteracts the effects of exhaustion, hardships and exposure, and remedies rheumatism, dyspepsia, constipation and debility.

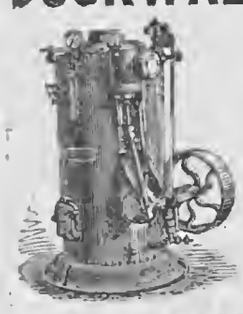
COLUMBIA BICYCLE.

Bicycle riding is an accomplishment easily acquired, and is rapidly becoming the most popular of out-door sports; as a health restorative it is invaluable, bringing into action every muscle of the body, strengthening the lungs, and invigorating the wearied brain. The practicability of the machine is generally conceded throughout the country, and the thousands of bicycles in daily use are constantly increasing in number. Send 3c. stamp for catalogue, with price list and full information. THE POPE M'F'G CO.,
76 Summer Street, Boston, Mass.

BOOKWALTER ENGINE


Compact, substantial, economical and easily managed.
Guaranteed to work well and give full power claimed.
Engine and boiler complete, including governor, feed-pump, drive-pulley, etc., etc. at the low price of

3	Horse power....	$240
4½	" "	280

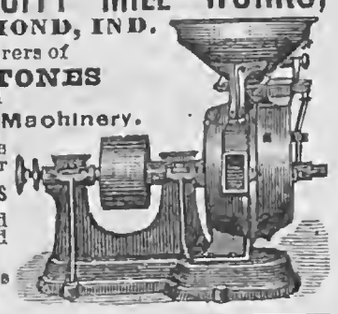
Manufactured at Springfield, Ohio. Send for Descriptive Pamphlet.
JAMES LEFFEL & CO., Springfield, O.
Or, 110 Liberty St., New York City.

CIDER PRESSES AND GRATERS.
BOOMER & BOSCHERT PRESS CO., Syracuse, N. Y.

RICHMOND CITY MILL WORKS,
RICHMOND, IND.
Manufacturers of
MILL STONES
and
Flouring Mill Machinery.
We manufacture the best French Burr CORN AND FEED MILLS in the country. Send for description and prices.
State you saw this in RURAL N.-Y.



Monarch and Young America
CORN AND COB MILLS

Only mills made with Cast Cast Steel Grinders.
Warranted superior to any in use, for all purposes. Will grind faster, run easier and wear longer. *Satisfaction guaranteed.* Also, Corn Shellers, Feed Cutters, Cider Mills, &c. Send for circulars and prices.
Manufactured by
WHITMAN AGRICULTURAL CO.,
St. LOUIS, Mo.

PURE COTSWOLD SHEEP. Three Yearling Rams got by Imported "Heir of Burford" (A. C. Record 467), Six Ram Lambs, got by Imported "Oxford Prince" (500). All from *registered* ewes and of good quality. Also a few good Cotswold Ewes; all for sale at reasonable prices.
T. P. DICKSON,
CLARK, MERCER CO., PA.

Mill Manufactory
Established 1851,
CRIST MILLS,
Of FRENCH BUHR STONE
Portable Mills for Farmers, Saw Mills, etc.; 16 sizes; over 2,000 in use. Price from $80 up. Complete Mill and Sheller, $95. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mills.
NORDYKE & MARMON CO.,
Indianapolis, Ind.

TROPIC FRUIT LAXATIVE
UNLIKE PILLS,
And the usual Purgatives, is pleasant to take, And will prove at once the most potent and harmless System Renovator and Cleanser that has yet been brought to public notice. For Constipation, Biliousness, Headache, Piles, and *all disorders arising from an obstructed state of the system*, it is incomparably the *best curative extant*. Avoid imitations; insist on getting the article called for.
TROPIC-FRUIT LAXATIVE is put up in bronzed tin boxes only. Price 50 cents. Ask your druggist for Descriptive Pamphlet, or address the proprietor, J. E. HETHERINGTON.
36 Park Place, New York.

NEW DESIGNS
IN
WILTON, AXMINSTER, MOQUETTE,
VELVET, BRUSSELS AND INGRAIN
CARPETS.
Manufactured by Ourselves
Expressly for the Season's Retail Trade.
THESE GOODS WILL BE FOUND TO COMBINE TO AN UNUSUAL EXTENT
Elegance in Style and Finish,
Durability in Wear, and
Economy in Price.
WE ALSO OFFER AN EXTENSIVE ASSORTMENT OF Turkish, Persian AND East Indian CARPETS, RUGS AND MATS, DOMESTIC OIL-CLOTHS, AND OTHER Popular Floor Coverings AT
Extremely Moderate Rates.

Farm Topics.

WESTERN FARMING.—XIV.

W. I. CHAMBERLAIN.

Bonanza Farming—III.

IT is, I think, an important question whether Dakota is likely to be a desirable home for "small farmers;" for, as I have tried to show in former articles, farming on the immense scale on which Messrs. Dalrymple, Cass, Cheney and Grandin do it, is not likely to be permanent or long continued. Nor, I think, do these gentlemen so regard it themselves. Nor will farming probably be permanent on the smaller but still very large scale of the Messrs. Williams, Steele, Vandeusen, Clark and others, each of whom has a thousand acres or more in wheat and oats. For with farms even of this size or with so much under cultivation, it seems well-nigh impossible, under the present system, to restore the diminishing fertility, and wheat after wheat exhausts it much more rapidly than corn or varied crops. Smaller farms, with a recuperative rather than an exhaustive system of agriculture, will in time, then, be a necessity in Dakota as well as elsewhere. The land must be farmed by men who live upon it and intend to make it their future homes, and not by those who go there year by year in Summer time and strip it of one more year's crop and then retire to warmer climes for Winter.

What, then, are the obstacles or objections to Dakota as a place of permanent residence for "small farmers"; how serious are they, and how far can they be overcome? They seem to me to fall chiefly under the head of climate and lack of fuel, good water and fruit.

The Winters are long and severe. But so far as suffering personally from cold is concerned, that is a mere comparative matter. The people of one latitude always think it too cold a little further towards the pole. New Orleans pities shivering Cincinnati in Winter, and Cincinnati wonders how they live at all in Cleveland and Chicago. Chicago says, "We're all right, but, bless us, they catch it in St. Paul!" And St. Paul says, "It's quite mild here, but they *do* freeze up in Fargo and Winnipeg." Immigrants usually follow nearly the same parallel of latitude or temperature in moving. Those who come to Northern Dakota are largely from Canada, Northern New York, Vermont, New Hampshire and Maine, Minnesota or Wisconsin, or from Norway and Sweden; and they expect and are accustomed to the cold. Personal inconvenience from the Winter cold will not be a serious obstacle. But will the cold entirely suspend profitable labors or prevent mixed husbandry? It will certainly suspend tillage. That it will prevent the raising of clover and Timothy and the profitable keeping of stock I am not at all sure. Stock are absolutely essential to permanent success in agriculture. They are Nature's condensers of coarse products and of values and restorers of fertility. Oats and vegetables grow most luxuriantly in Northern Dakota, and the early-maturing corn will do pretty well. But long distances and the necessary cost of freight make it unprofitable to raise much for shipping except the higher-priced wheat. But, now, if domestic animals can be profitably kept, they will condense these crops for market, and in addition furnish the very means needed for retaining and restoring the fertility of the soil.

Whether clover and Timothy will really thrive in northern Dakota I am not sure, but believe they will. I saw both thriving in small plats of an acre or so near Fargo, and see not why they should not grow as in Northern Vermont, except that the snow-fall is so light and the winds so high as to leave the fields less protected. If they will thrive, the problem of Dakota mixed agriculture is solved. The fertility can be maintained with a much smaller amount of stock comparatively. Grass and especially clover, even without stock, recuperate the soil for wheat by those processes of nature which even yet we do not fully understand. At all events, there is no doubt that potatoes, beets, carrots and Hungarian Millet will thrive, and on these and on corn and oats, with their stalks and straw, cattle and sheep can be stable-fed or corral-fed in Winter, while the native grasses will furnish pasture in Summer, even if clover kills in Winter. And by proper management the immense amounts of manure made from these and from the judicious rotting of the wheat straw used as litter or bedding, can be drawn and spread upon the fields when they are so frozen as to prevent tillage. With this Winter care of good herds of cattle, sheep and horses, the long Winter will not be the dull and unprofitable season it now is, when farmers, as Mr. Dalrymple says, "crawl into their holes for five or six months and pull the holes in after them." Thousands of horses are brought into the Territory now each year. The long Winter of almost entire rest for teams would greatly favor the breeding of colts, the mares being worked in Summer. Thus the mere coldness of the Northern Dakota Winters need not prevent a profitable mixed husbandry by "small farmers."

The question of fruit, fuel and water must go over to another article.

Floricultural.

THE SWEET-SCENTED SHRUB.
(Calycanthus floridus.)

A FAMILIAR-SOUNDING name, known indeed to many, but seeming more familiar still from the natural homely suggestiveness of its simple terms. Many shrubs, it is true, are sweet-scented. We almost expect every flower to be sweet-scented. Why, then, distinguish this one shrub by an agreeable title which applies to many others? Simply because it bears the palm, in its way, for fragrance among all shrubs. Spicy, sweet, penetrating, poignant, one breathes its odor, especially when crushed, with no thought of comparing its delicious peculiarity in this respect with that of any other plant. It is simply, from very excellence of odor, *the* sweet-scented shrub. The flower, however, which is so distinguished in odor, is very unpretending in appearance. Yet there is something very quaint and attractive in its simple foliage and pure outlines as well as in its solid, reddish-brown self-color. At a little distance these attractions are hardly noticeable and serve the purpose only of relieving the rich green foliage with dark, reddish spots of solid tint. These flowers are also valuable because they bloom in July and August.

The Sweet-scented Shrub is termed, botanically, Calycanthus from the two Greek words Kalyx, a calyx, and Anthos, a flower, in allusion to the attractive, flower-like color of the brown calyx. In foliage, the Calycanthus floridus—for we speak of the species best known as the Sweet-scented Shrub—is decidedly effective. The leaves are large for a shrub, ovate and shining. Their texture is firm and their color an agreeable lively green, while the contour of the bush itself is roundish and at the same time picturesquely irregular. Indeed, it is well worthy, for its leaves alone, of a place in any collection of choice shrubs. Its position in shrub groups should be somewhat intermediate, or among the larger-growing plants.

Although the Calycanthus floridus is well suited to an isolated position on the lawn, we should generally prefer to plant it near the outer line of the group, where its decided attractions can be more readily seen and effectively blended in their peculiar manner with surrounding foliage. It is a good plan sometimes to group together masses of the Sweet-scented Shrub. The effect of their irregular, picturesque contours thus blended, is fine, although other shrubs, the althea, for instance, present a stiff, monotonous appearance when treated in like manner. Calycanthus floridus transplants easily, like most deciduous shrubs, and is entirely hardy. For years it was considered somewhat difficult to propagate except from seed, and elaborate operations in the way of layering were undertaken. Of late, however, it is propagated with comparative ease from cuttings of its own roots stuck in sand.

SWEET-SCENTED SHRUB.—FROM LIFE.—FIG. 346.

The other species of Calycanthus, lævigatus, glaucus, etc., do not materially differ from C. floridus in their appearance as members of the shrub group. Minor distinctions exist in the narrower and perhaps more shining leaves of the Lævigatus and also, perhaps, in the lighter color and later appearance of the flower of the same species. C. glaucus differs from C. floridus still less. Virtually, therefore Calycanthus floridus is the Sweet-scented Shrub which forms lawn-planting material of excellent character, whether we consider its habit of blooming in Mid summer or its attractive foliage and spicy odor.

Field Crops.

FLAX CULTURE.

THE SOIL that will produce a good crop of grain is suitable for flax; but the best is a deep, rich, mellow, clayey or sandy loam free from wet. On cold, wet low-lands and river bottoms and also on dry sandy soils flax will prove a failure owing chiefly to mildew. Heavy, slippery clay soils will yield only a light crop, unless thoroughly underdrained, well pulverized and fertilized. River bottoms and uplands in which a black mucky soil predominates, if well drained and rich enough to produce a good crop of grass, will yield a good crop of fiber and a small one of seed, but if the soil is sufficiently fertile to produce a good crop of potatoes, corn, oats or rye, it will also give a large crop of both seed and fiber. In the West less attention is generally paid to selections of suitable soil than in the older-settled States, and it is there found that fair crops can be grown on nearly any kind of land, if it is dry and free from weeds. The manuring, too, which is needed elsewhere, is unnecessary on the naturally fertile soils of the trans-Mississippi States. Land that has been under hoed crops the previous year is most suitable for flax, as it can be kept freer from weeds than other sorts, and the previous manuring will render an application of the fertilizers to the flax unnecessary. A clover or rich pasture sod, however, as well as a wheat, barley or oat stubble, or land that has been under corn, if free from weeds and sufficiently rich, will all produce good crops of flax.

THE PREPARATION OF THE SOIL, if heavy, should be begun at least as early as the previous Fall, by plowing it thoroughly and deeply in late October or early November for this latitude, so that the action of the frost during Winter may mellow it before Spring. If the land is not sufficiently rich from the manure applied to previous crops—which is always a desirable condition—and barnyard manure is to be used, it is better to plow it under in the Fall, so that the different ingredients may become diffused in the soil before Spring. For this purpose thoroughly rotted manure only should be used, that from sheep and hogs being the most suitable. If weeds appear before Winter, they should be destroyed by the use of the harrow or cultivator. When the soil is light and porous Fall plowing is not advisable. In the Spring so soon as the ground has become dry enough, it should be again plowed deeply, cutting thin furrow slices; then harrowed twice and rolled. The finer the soil, the better the crop, the more

even the growth and the finer the fiber. If it is desired to apply fertilizers at this stage, wood ashes are an excellent application, and so is a mixture of equal parts of plaster, salt, and ashes sown at the rate of, say, six bushels per acre after the land has been plowed and harrowed. The ground must not be made too rich, however, for in that case the flax is sure to lodge badly. Immediately before sowing the seed, care should be taken to destroy all weeds, for these cannot be easily got rid of after the crop has come up. The ground, too, should be leveled, all large stones removed and all small ones pressed down, to facilitate harvesting.

SOWING should be done as early in the Spring as the ground is dry, mellow and warm, and danger from heavy frosts is over, the date varying with the locality, from the last of March to the first of May. If sown too early weeds and grass are likely to be troublesome, the crop to be stunted and hard frosts to be harmful; but early sowing is necessary to obtain a fine quality of lint, as then the crop grows more steadily. With reference to the soil, the best time to sow is when it is friable after a shower and just after a final harrowing. As the seed is very slippery, great care must be taken to sow it evenly, which is best done by sowing—generally by hand—half of it first one way, and then cross-sowing the other half. A good sower of grass seed should find little difficulty in sowing flax seed properly. To cover the seed a brush harrow, drawn by hand, is the best implement, as the trampling of a team is thus avoided and the seed is covered just deep enough—not over an inch. A light seed harrow is also extensively employed. This should be drawn up and down and crosswise to spread the seed evenly, and prevent it from growing in rows in the depresssions made by the harrow teeth. Sometimes the seed is left to be covered by the rain; but this is the lazy man's method and usually results in the lazy man's crop. Hand weeding is generally considered too expensive in this country: but great care should be taken before sowing the seed, that all weeds and grass are thoroughly extirpated, and any single weeds should be *cut* after the crop is up—if *pulled* some of the flax is sure to come up with them. The weeding should be done with bare or stockinged feet, so as not to injure the crop, and when the latter is about six inches high. Care must be taken to leave the ground level, otherwise the flax will not ripen evenly. To insure this object a light rolling is generally given after seeding.

THE SEED should be selected as carefully as corn seed, as its character greatly influences the yield and quality both of the seed and fiber. For the latter Riga or Dutch seed is considered the best; but, as these kinds are expensive, American seed is generally used. Plump, bright, oily, heavy seed, that will sink in water, is the best, and it would be well to run even this, when convenient, through a fanning mill, to blow out all the light seed by a strong blast. When one grows his own seed, the flax that grows on the best ground and ripens earliest should be selected and half thrashed, as the plumpest, earliest-matured and most productive seed will shell out first. It is well to procure the seed from a distance occasionally; for if grown for a number of years in the same section, it degenerates. Old seed should not be used, as it does not vegetate sometimes. The quantity of seed to the acre will depend on the fertility of the soil and the object for which the crop is raised. A rich soil requires less seed than a poor one; and when the flax is grown for lint, much less is required than when it is raised for seed. When sown thinly, each stalk is furnished with several branches, each of which produces seed. In that case, however, the lint is coarse and uneven, and is fit only for tow. The number of branches depends upon the thickness of the crop and the fertility of the soil. When the seed is sown thickly there is but a single stem which produces less seed, of course, but a finer fiber. When raised for seed, from half a bushel to a bushel is usually sown, according to the richness of the ground, the former quantity being the rule. For lint, from two to two and a half and sometimes three bushels are sown; and for lint and seed, about a bushel and a half is the usual amount.

HARVESTING is the most laborious and important process in flax raising. When the flax is grown entirely for seed, or for seed and "coarse tow"—which consists of the entire fiber of the flax in contradistinction to "fine tow," consisting of the lint separated from the long fiber when the flax is dressed—it should be allowed to get ripe before it is harvested, though not ripe enough to shell readily. It can then be cut with a scythe, cradle or reaping machine, the same as ordinary grain. Sometimes no attempt is made to keep the stalks straight or the butts even, and it is then called "tangled flax," and, having been cut close to the ground, it is cured, raked, cocked, stacked or put in the mow, just like hay. If such flax is not housed, the top of the stack should be well covered, as it will not turn rain so well as hay. When flax is cut with a reaper and the stalks are to be kept straight, it is forked off the platform in gavels which should be tied just below the bolls and set on the butt-ends. If it is too long or heavy to allow it to be forked off while the reaper is in motion, it will usually pay to stop the machine and take each gavel off by hand. If the crop is grown for fiber, the best way to harvest it is to pull it by hand, especially for small growers. Pulled flax sells for a higher price than cut flax, because, in addition to the greater length of the fiber, it runs more smoothly in spinning and makes a cleaner, smoother thread, for the reason that the fibers taper from a few inches above the root until they run out entirely at its end; whereas in cut flax the ends of the fibers are stumpy.

WHEN the flax is pulled too soon there is a loss in the quantity, and when too late, in the quality of the fiber. The proper time for pulling is when the bolls have begun to turn from green to brown, the stems have become yellow for two-thirds of their length, and the leaves have died half way up the stalk. While pulling, the workman takes a breadth about four feet wide, and either spreads the flax in a swath behind him, throws it down in gavels, or binds it himself as fast as he pulls it. He should grasp a handful just below the bolls, so as to leave the short stalks, grass and weeds standing, and with both hands pull it up with a quick jerk; for if pulled slowly a much larger quantity of earth will adhere to the roots. When a double handful has been pulled it should be "butted" a couple of times on the ground to "even" it and get rid of the adhering soil. If the weather is threatening, it is well to bind it at once and throw about eight gavels together to facilitate setting them up in long stooks, which should be only two bundles thick, as the flax will then dry quicker and better. The stooks should always be set north and south, so that the sun can shine on both sides during the day. In this case it will require about two weeks to cure before it is fit to be put in the barn, stack or mow; for, although the outside of the bundle may appear thoroughly cured, the inside will be too green. In fine weather it is better to spread out each double handful, as it is pulled, in a swath about an inch thick, leaving a space of a few inches between the spread gavels, or alternating them butts and ends, to facilitate turning and binding. Care must be taken to lay the butts as even as possible and the stalks quite straight, and this position should be carefully preserved in subsequent operations. After the swath has been dried on one side, it should be turned over to sun the other, and then bound and set in stooks, to be taken to the stack when cured.

When for any reason the flax has grown of various lengths, each kind should be bound in separate gavels; otherwise a large part of the short fiber will be separated from the long fiber in the dressing and be wasted in the tow. Moreover, if short stalks are bound together with long ones many bolls will not be thrashed, so that the seed will be lost. Flax that has lodged and suffered from wet should also be kept by itself; and the proper assorting can most easily be done while pulling or mowing, by putting each sort in separate gavels. The bundles need not be kept separate, however. Three or more machines have been devised for pulling flax, but although some of them do good service under favorable conditions, none of them has yet superseded hand-pulling.

THRASHING may be done in several ways. If the thrashing machine is used, open the concave so that the teeth will just meet; thrust the top of each bundle against the cylinder in motion, withdrawing it and turning it partly round until all the bolls are removed, being careful not to allow it to be snatched out of the hands; or the bundle may be unbound by one man, held in fan-shape against the revolving cylinder by another, and rebound by a third. If a flail is used, lay the heads of the bundles together on the barn floor, thrash only the tops, and shake the bundles to get out the seed. In "whipping" the heads of the bundle or of a part of it, are struck sharply over a large stone, inverted plow or stout barrel. "Rippling," by which the bolls are removed by drawing the tops through a coarse hatchel or comb with sharp-pointed iron teeth, is an Old-Country practice, seldom employed here. Nearly every new thrashing machine, however, has a clover huller attachment, while there are at least a couple of excellent clover hullers and separators which hull, separate and clean the seed by one operation. The owners of these generally travel with them through the clover-growing districts, and perform quickly and well the work that was formerly done imperfectly and laboriously.

"Retting," "breaking," "scutching," etc., relate to the manufacture rather than the culture of flax, although at least the first of these operations is usually performed by the grower, and the others might often be profitably done at home in Winter when other kinds of farm work are partly or entirely suspended.

THE WHITE ELEPHANT.

Reports from New York, Pennsylvania, Ohio, Michigan, Washington, South Carolina, Wisconsin, Oregon.

It has been stated in these columns that White Elephant potatoes were sent last Spring to sundry persons in various parts of the country, with the request that they would plant them and report the results. The following are average specimens of the reports thus far received:

ROME, Oneida Co., N. Y.—The White Elephant Potato has produced more than any potato I ever planted, and that, too, under unfavorable circumstances. I think they will prove a valuable acquisition. I shall hope another year to give a still better account, as I intend to avoid the unfavorable conditions in which they were grown the past year, and grow them on ground well prepared, under more favorable circumstances.

JONATHAN TALCOTT.

FOND DU LAC, Fond Du Lac Co., Wis.—In regard to the White Elephant Potato, I observe in it the same strong and robust-growing habit as in the Beauty of Hebron. This alone is a valuable trait in both varieties in the way of resistance to the potato beetle. The Elephants grow close together in the hill and are therefore easily dug. The yield was really enormous, and the crop was fully ripe on September 15. We dug from the one potato planted (in 18 hills, one eye in each), two bushels and one peck, full measure. Its flavor cannot be too highly spoken of; it is the finest we have had for years. No sign of rot or disease. We found but very few small ones in the hill. All were solid and of a good, well formed size. In short, I think the Beauty of Hebron for early, and the White Elephant for late will be the two standard varieties for those who want to plant potatoes for profit on either a *large* or *small* scale. E. HANTZE.

CORVALLIS, Missonla Co., Oregon.—About the 1st of May, I planted one half of the potato sent here for trial—the White Elephant. This half of one potato produced 15 pounds. I shall save them all for planting next year. The President, B. L. Arnold, planted the other half; I have not yet heard the result of his experiment. B. J. HAWTHORNE.
Oregon Ag'l College.

MAMARONECK, Westchester Co., N. Y.—The White Elephant Potato kindly sent me for trial has proved itself, even in the past unfavorable season, to be all you claim for it. It is exceedingly large and wonderfully productive, and the quality is excellent. Baked, it comes to the table dry, mealy, and pure-flavored. I feel sure that the White Elephant will have a "big run." It occurs to me that it would make a splendid potato for a "fat man's clam bake." PETER B. MEAD.

COLUMBUS, Franklin Co., O., Oct., 15.—The White Elephant Potato received from you was planted with special care, but failed in productiveness when compared with Dunmore, Burbank and Early Rose, which had the same opportunities.
C. E. THORNE, Farm Manager.
Ohio Ag'l College.

NEW CASTLE, Westchester Co., N. Y.,—The White Elephant has grown finely and produced well. Its quality, however, is not first-class, but in so unusually unfavorable a season as the past has been with us, this crop can hardly be taken as a criterion.
F. M. HEXAMER.

AGRICULTURAL COLLEGE, Orangeburg, S. C. The White Elephant potato was planted with care, though rather late for this latitude. It did remarkably well for a time, but the severe hot weather of Mid-summer burnt the vines to the ground. We plant early in February and harvest early in June or else the Irish potato does nothing.
E. COOKE.

DETROIT, Mich.—The White Elephant Potato did very well with me. I raised a full half bushel from the tuber sent me. It is a nice, white, mealy potato, a strong grower and very productive. The bug troubled them very much. FRED. WALTZ.

MORRISVILLE, Bucks Co., Penn.—The White Elephant Potato grew very irregular in size, but the quality is excellent. I had about a peck and a half from the potato sent. It has been a poor season for the crop with us.
E. S. KIRKBRIDE.

NEWTOWN, Long Island, N. Y.—This has been a very poor season to try new varieties of potatoes; but we gave the White Elephant you sent us as fair a trial as the season would allow. We are very much pleased with it and think very highly of it. It is very prolific; we have one bushel from the one potato. The only fault we have to find with it is that it is white, which makes it less salable than a colored potato. JOHN E. BACKUS.

A COMPARISON OF POTATO VARIETIES.

LAST Spring I bought nine kinds of potatoes, one pound of each; cut them to one eye; planted them two feet apart, and gave them the same care.

Below I give the number of eyes, time of planting, time they were dug and the yield in pounds:

Planted.	Dug.	Variety.	No. of eyes.	Yield ℔ lb.
April 29.	Aug. 26.	Early Ohio	40	46½
"	Sept. 11.	Extra Early Vermont	70	117½
"	"	" Snowflake	55	117
"	Oct. 1.	Beauty of Hebron	23	94½
"	"	Mammoth Pearl	35	181¾
May 7.	Sept. 23.	Burbank's Seedling	26	84
"	"	Early Rose	60	114
"	"	Brownell's Superior	39	68
"	Oct. 1.	Snowflake	70	131

The Early Ohios were not large, but there were few small ones. Of the Extra Early Vermont some were large but a good many were small. The Early Snowflakes were large and handsome, a few only being small. The Beauty of Hebron were large and handsome, with no small ones; one weighed nearly 28¼ ounces. The Mammoth Pearls were large and handsome, few were small. Burbank's Seedlings were large, but spongy; only a few were small. Of Early Rose some were large and a good many were small. Brownell's Superior were the evenest and handsomest potatoes I think I ever saw—not large. Snowflake large and handsome, but few in a hill.
Essex Co., Mass. HENRY MERRILL.

MOLD'S WHITE WINTER WHEAT.—A friend, at Lakeport, Lake Co., California, sends us samples of the above wheat, of which he says:—

"Two years ago I got four quarts of wheat from the Agricultural Department at Washington, and drilled it on something less than half an acre, and harvested 1 122 pounds. Last October I sowed the seed on several acres of very gravelly and clayey land that has been in grain every year for twenty years without any manure. On July 6th, I cut the crop and measured the product from a small piece of about average growth, and it yielded at the rate of 50 bushels per acre. The day after thrashing I had some ground and got 75 pounds of No. 1 flour per 100 pounds of wheat. I am now selling the same for seed at two cents per pounds while other wheat is selling at one cent."

REMARKS.—Thanks for the beautiful heads which are among the finest we have ever seen. We counted the kernels of three heads, and found them to contain respectively 102, 90 and 95. Many spikelets contained five kernels. The variety is Mold's White Winter. It has not done well with us.—EDS.

RATHER DOUBTFUL.—A friend writes us:—"At another time I will report the yield of my boy's acre of Blount Corn. I think it will surpass yours in hight and quantity of grain." It may in hight—we hope it may in yield.—EDS.

Farm Economy.

THICK AND THIN SEEDING.

SEEING by two late issues of the RURAL that farmers are interesting themselves with regard to the quantity of seed that should be sown per acre, I give the results of my experience and observation in the matter.

In the Summer of 1878 I began preparing 31 acres for wheat better than I had ever done before, bestowing a little better cultivation on a lot of 15 acres than on the remainder. This lot was so thickly covered with wheat straw that it took a man to fork it into the furrow. I harrowed it once before harvest and cultivated it once before and three times after harvest. Before the last cultivation about half the ground was again covered with fine barnyard manure, which was put on the poorest spots.

I began sowing on August 31, having set the drill at 44 quarts per acre, and drilled the same quantity on the other field. Neither myself nor, I think, any of my neighbors ever saw a handsomer piece of wheat than mine was on May 26, '79. On that day there came a heavy rain-storm which left the wheat badly lodged. Most of it righted up again, however, but shortly three consecutive storms left it as though a man had turned into the field a span of three-year-old colts, with a roller attached to them, and left them to run at their own wild will. It was so badly lodged that I don't believe there was in the whole field unlodged wheat enough to make a dozen sheaves.

Now for the final result. From that 15-acre lot I thrashed 690 bushels of good, plump, clean Fultz wheat; yet an idea can be formed of how badly it was lodged from the fact that from the rakings I thrashed 40 bushels, which are included in the above yield, making for the field an average of 40 bushels per acre

The other field, on which somewhat less care was bestowed, was sown to Diehl and yielded 471 bushels, an average of 29½ bushels per acre, making the average for the entire crop 37½ bushels per acre. One of my neighbors at the same time sowed two bushels per acre, and his crop averaged 27 bushels per acre.

In the Fall of 1879 I gave the same treatment to one of my fields, sowing just 1½ bushel per

acre, and the yield averaged 30½ bushels, Last Fall, too, the same neighbor, declaring that it was the abundance of seed that made a good crop, sowed two bushels per acre, and harvested an average of 17 bushels.

With regard to that 15 acre lot, I must state that I seeded it down to clover in the Spring of '79, but on account of the wheat having lodged so badly, it smothered the young clover all out. It was against my inclination, therefore, that I sowed it once more to wheat, so as to seed it down to clover again last Spring; and the yield this year averaged 22 bushels per acre, and, moreover, I got a good stand of clover and Timothy.

This Fall my neighbor sowed to wheat a field adjoining one of my wheat fields. Adhering to his old rule, he sowed two bushels of seed per acre, while I sowed at the rate of only 1½ bushel; and engaged to have a larger average yield than he would have next year. I am thoroughly convinced that the condition of the ground has more to do with a good crop than the quantity of seed.

In the RURAL of October 9, under "What Others Say," reference is made to a discussion between two farmers, one of whom says that should wheat drop to 80 cents a bushel at Chicago, many would drop wheat-raising, while the other asserts that a farmer must get a dollar a bushel to make a profit. Now, in my opinion, both are right; for the cost of raising wheat rests a good deal with the farmer himself. If he farms so as to harvest only 15 bushels per acre, he should receive at least $1.25 per bushel for his wheat; but to make wheat-raising profitable, he must get a yield of upwards of 20 bushels per acre, and obtain one dollar per bushel for his crop. He cannot raise wheat with profit with a smaller crop or a lower price for that yield. I would prefer the profit on sheep, with wool at 25 cents per pound, to that on wheat at $1 per bushel, with a yield of 20 bushels per acre, provided the farmer is not too careless to count his sheep before housing them at night, and not too lazy to be out at five o'clock every morning in lambing time to see by what percentage his flock had increased during the night, particularly in bad weather.

Kendallville, Ind. J. S.

Pomological.

OUR FRUIT PROGRESS.

A LETTER FROM MARSHALL P. WILDER.

My Dear Sir:—I am much pleased with the RURAL, especially with your enterprise in fruit culture and the new varieties which are constantly coming to notice. It is our good fortune to live in an age of extraordinary progress in pomology.

No country has such facilities for fruit culture, and no nation has made such rapid advances as we have witnessed in our day. The number of new and really fine kinds of American grapes that have appeared within a few years is astonishing. It is only about 40 years since we talked of the hybridization of the grape, and it was then considered by many as of no practical value. Look now at the results, and these are only the beginnings of that day when every section of our broad land is to be furnished with varieties suited to the several localities; varieties which will be as hardy and certain of success as our most common fruits. See the number of fine sorts of which the Concord is the mother! and it is only 26 years since it came to notice. Look at the hybrids of Rogers, Ricketts and others, and note the progress. Look at Ricketts's Lady Washington, a graft of which has made this year 75 feet of wood, and which possesses more vigor than the Concord, its mother.

Look at the Prentiss, Duchess, Pocklington, Niagara and other white grapes of this year, and who can doubt the beneficial influences of cross-fertilization, either natural or artificial. I have written more than I intended, and so close. MARSHALL P. WILDER.

Dorchester, Mass.

Penciled Zinc Labels.

AN esteemed contributor writes us as follows under date of Oct. 9:

"You are manifestly unaware that the use of these penciled zinc labels was warmly advocated a dozen or more years ago by the distinguished horticulturist, Mr. Marshall P. Wilder, of Dorchester, Mass. The subject was much talked about at the time, and I remember to have myself heard Mr. Wilder describe his experiences, as long ago as the Winter or Spring of 1866–'67, at a meeting of the Boston Society of Arts. I examined the labels which were exhibited by Mr. Wilder at that time, and understood that many of them had been in actual use for considerable periods. Together with the other members of the Society, I was a good deal interested in seeing how the graphite of the pencil had shielded the zinc beneath it from oxidation. The writing was plainly visible in the shape of non-oxidized or comparatively little oxidized markings on a field of more completely oxidized zinc.

Educational.

AGRICULTURE IN SCHOOLS.

IRELAND has taken a step in advance of all other countries in regard to the teaching of the rudiments of agriculture in the public schools. Perhaps there may be reason and wisdom in this as well as justice, for agriculture in that unfortunate island must necessarily be in a deplorable condition, when the soil, proverbial for its excellence, does not support its occupants. In such a case the first principles of the profitable culture of the soil may well be taught in the schools, which are the only means of reaching a population that is quite without any other source of instruction. But it is an evidence of a popular need of rudimentary instruction, that a beginning has been made, in Ireland, in the way of teaching children as much as possibe of the first principles of the industry by which they are supported and must soon support themselves. This need is as apparent in America as in Ireland.

It is a fundamental one, at least, so far as regards the rural population. It is admitted that it is the duty of the State to instruct the youth in such knowledge as shall make them industrious and useful citizens. This is one of the first principles of our beneficent form of government. In urban schools, children and youths are taught the principles of mechanics and other useful sciences, as well as to read, write and figure; they are also taught the principles of commercial industries, and in all useful and practicable ways are prepared to enter the several employments open to them in towns and cities. In rural schools the system of education does not adapt itself so well to the special requirements of the children and young men and women who attend them; and when the time comes for these to leave school, they are too apt to look from home for employment, because their minds have not been turned in the direction of their home pursuits.

More money can be made by a young man upon a farm than in a city store or office. The wages paid by farmers are more than the average paid in stores and offices. A youth of 16, who thinks himself well paid at three dollars a week in a lawyer's office, can earn as much in money, with his board in addition, on a farm. This is the lowest rate paid by farmers and a competent farm workman can earn more money than that. The young man who earns eight or ten dollars weekly in a city is thought well off. But when the cost of board, and the requisite expensive clothing, and the wasteful habits of city life are all covered, there is nothing left to lay by. The young farmer can easily save a hundred dollars a year, and in a few years by study and observation can become such a master of his art that he can rent a farm, stock it with his savings, and earn a comfortable and independent living. It is worse than useless for those who have influence in molding popular opinion to lead young men to believe there is no place for them in the country, and to say that a man cannot be a farmer unless he owns his farm. To do this in all cases is an impossibility. Does every man engaged in business own his store, his stock or his business? Not by any means. Every one hopes to do this in time, but the prizes which fall to the successful ones are buried under thousands of blanks and failures. It is not so on the farm. The industrious young man who is able to rent a farm, has a far better chance of owning it, or another, in a reasonable time, than the clerk in a store or a workman in a factory has of owning a similar business for himself. Farming is a progressive business. Stock accumulates very fast and in a few years a small beginning attains to respectable proportions. If one only knows how! And here is the point which we wish to enforce.

Rural youths should be educated in the principles of the art and science of agriculture; taught to think and reason about it; and become possessed of the ability to be their own teachers afterwards. This rudimentary knowledge can only be taught in schools. We propose to make an effort in this direction. We begin in this number, on page 730, a series of articles on Farming for Boys and Girls, to which we earnestly call the attention of parents and teachers. We ask that these articles be read and criticised. They are intended for the older children and will be written plainly, in a style that shall be correct as examples of composition, and as such admissible into schools. We suggest that they be read in families, as the children are gathered around the evening lamp, and made the subjects of conversation and discussion: also that they be read in schools, by one of the scholars who is capable of reading them well, and that the class then recompose them in their own words and style, as an exercise not only in agricultural science, but in composition. The matter will be found interesting and instructive, and may thus be made to serve two useful purposes. We ask the co-operation of school directors and teachers in this important work and shall be pleased to receive suggestions from them in aid of our design.

Veterinary.

TEXAS FEVER.

D. E. SALMON, D. V. M.

THE interest in this disease, which had nearly died out among Northern stock raisers since the great outbreak of 1868, seems to be once more aroused by the report that Texas cattle affected with it have lately been landed in England. As a consequence, many of our papers have contained accounts of the nature of the disease, which are more or less misleading; and even the most trustworthy statements that have appeared contain important assertions which, it seems to me, can hardly be justified by what is at present known of the disease. One thing is certain, and that is, that in a vast district in the Southern States the cattle, though apparently healthy, harbor the germs of a fatal disease that may be transmitted by them through the pastures to Northern cattle; and, on the other hand, Northern cattle taken to this district almost invariably contract the malady.

The northern boundary line of this district begins, at the East, somewhere in Virginia, and has a southwesterly direction, following very closely the line of the Blue Ridge Mountains, crosses the northern parts of Georgia and Alabama and deflects somewhat to the north through Arkansas and the Indian Territory.

Another point may be safely admitted, viz., that cattle which have never been within the habitat of the disease, as outlined above, though they may contract it, are incapable of transmitting it to other susceptible animals. We may go a step farther, even, and admit that the cattle from this infected district are not sound; that their enlarged spleens and their stomachs covered with erosions, or scars where these have been, are indubitable evidence that they are suffering from an affection to which they have become inured, by long exposure, to such an extent that their general health, *under ordinary conditions*, no longer suffers from it.

But we must hesitate before accepting the assertion that Southern cattle never show the disease in the acute form after being taken North; and that, consequently, Texas steers could not have been landed in England while suffering from it. Usually they do not; but when exposed to the fatigues and sufferings of long transportation, there is reason to believe that their powers of resistance are so reduced that the germs, which they carry in their systems, gain the ascendancy. Thus, Gamgee saw in Kansas a Texan steer suffering from the acute form of Texas fever as a consequence of the fatigue induced by being stampeded. In 1868 large numbers of these animals died at Cairo, Illinois, where they were landed from the boats, and it was believed that their death was due to Texas fever. Again, the New York Commissioners found two Texas steers at Buffalo in a dying condition, and on being slaughtered, "they presented every characteristic symptom of the genuine Texas cattle disease." A similar case has been reported to me in the mountains of North Carolina. It seems probable, therefore, that the fatigues of an ocean passage may be sufficient to produce the acute symptoms even in Texas steers.

Now, what is the danger to our English friends by the importation of Texas cattle? It would seem that under existing regulations there is absolutely none. The disease is only transmitted through the pastures; Northern cattle have stood in the same stables with newly imported Texans, they have pastured in lots separated from them only by a board fence, and have not contracted the disease. American cattle, being all killed at the port of landing, there is, then, no possibility of an extension of Texas fever in England.

The effect of using the flesh of acutely diseased animals as food is not well known. The New York Commissioners attributed certain epidemic affections of the digestive organs, which occurred in New York city in 1868, to the use of meat from such diseased cattle. The evidence in favor of this view, however, was not very tangible. As a rule, the flesh of animals suffering from an acute disease should be rejected, no matter what the nature of the malady. The flesh of Southern cattle, not affected with the disease in an acute form, is used over the extensive region I have mentioned, with impunity. The animals are not feverish; their flesh is perfectly normal in appearance; and the slight lesions I have mentioned as generally to be found, evidently have no injurious effect upon it.

But these animals harbor a contagious germ—is this without effect on the healthfulness of the flesh as food? The habitual use of such flesh over a large district, must be the answer to this question. We are in complete ignorance as to the nature of the germ in question, and it may be doubted if its habitat, in the body of these animals, extends beyond the digestive organs and bile ducts.

In my report to the Commissioner of Agriculture, which will soon be published, I have furnished evidence which proves the gradual extension of the infected district towards the North, and I have insisted upon the importance of adopting measures for checking this extension. These measures are the well-known sanitary regulations which nearly all civilized nations, with the exception of the United States, have adopted to limit the destructiveness of contagious diseases. The individual States seem powerless in this matter, and it is only by a Congressional law of general application that we can hope for relief; but while the contagious pleuro-pneumonia of cattle is not deemed of sufficient importance to receive the attention of our Congress, it is scarcely to be hoped that Texas fever will receive any notice from this august assembly until it is too late to accomplish beneficial results.

Dairy Husbandry.

THE DAIRY COW—NO. 13.

HENRY STEWART.

Milk-Houses.

MILK-HOUSES may be constructed of wood, of stone or of brick. If well constructed, one kind may be made as useful as another. For some purposes a frame house is the best, retaining an even temperature better than any other. Air passes through brick and plaster with much greater facility than is generally supposed. In a test once made the air, forced by a wind pressure of only three pounds on a square foot, passed through a brick wall plastered inside, with such ease that, when collected by a funnel one foot square and discharged

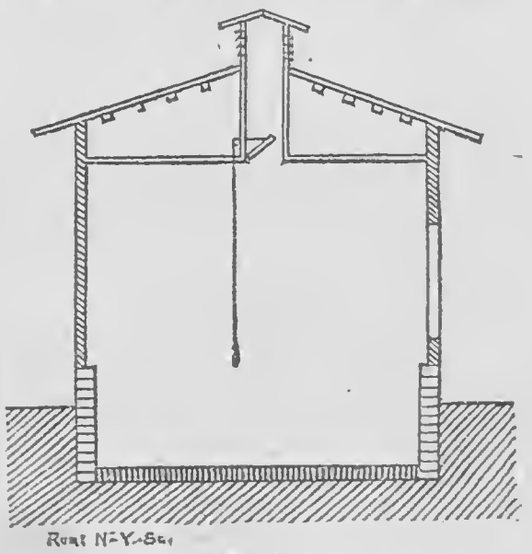

FIG. 347.

through a small orifice, it was sufficient to extinguish the flame of a common candle. It is this passage of air through brick, which causes a deposit of ice on the inner surface of the wall of a warmed house when a cold wind is blowing outside, or a deposit of dew on the inner wall of a cold house when a warm wind is blowing in the Summer. But a frame house must be well constructed, otherwise it will soon begin to decay at the foundation and this will at once destroy its usefulness. The frame house should be supported upon brick foundations, and if the soil is suitable, the foundation should be sunk at least four feet below the surface. A section through the center of a convenient milk-house is shown in the illustration—fig. 347.

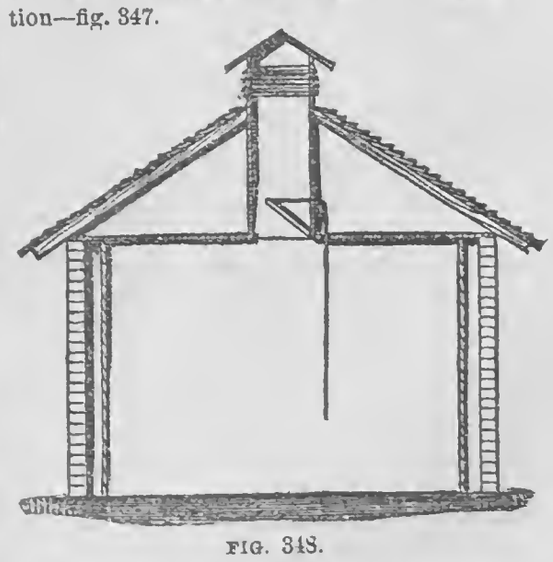

FIG. 348.

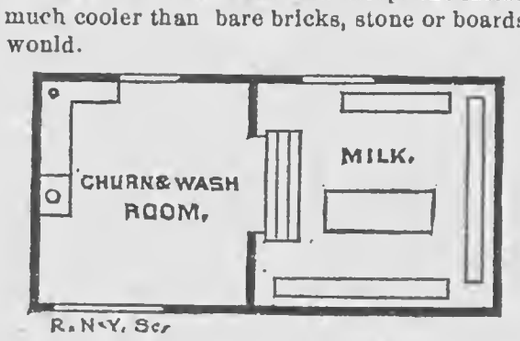
The foundation is of brick or stone, and is carried up sufficiently to preserve the timber from decay. The floor is covered with hydraulic cement concrete three inches thick, and is finished with a light coat of clear cement and sand in equal parts. One window is on the north side, and is protected by a wire gauze screen against flies. A space of two feet is left above the ceiling, and through this

a ventilator is passed, which is closed by a trap-door that can be raised by means of a cord reaching down below The walls and ceilings should be plastered and a hard-finishing coat of plaster-of Paris, costing only a few dollars extra, will add much to the cleanliness Lime wash will be always peeling off and the scales will fall down upon the milk occasionally. The hard finish is less porous than the lime, which is an advantage. A brick, stone, or concrete milk-house will be preferable where the material can be procured easily; stone or concrete will be the cheapest where the stone or gravel is abundant, and either is better than brick both for Winter or Summer use. If the walls are lined inside by means of furring strips four inches thick upon which the laths are nailed, a considerable air space will be secured and this will help greatly to preserve an even temperature in the house. A section of a house constructed in this manner is shown at figure 348. The outside of the milk-house should be painted or washed white, as this reflects the heat and keeps the inside much cooler than bare bricks, stone or boards would.



DAIRY HOUSE.—FIG. 349.

For a butter dairy, a churning room will be required, and this room should be provided with a sink and water for washing pans and utensils. A plan for an arrangement that has been found convenient is here shown. To secure drainage, the floor is raised at least a foot above the level of the ground, and the surface outside should be graded up to the door-step which should not be raised more than seven inches. It is very inconvenient to have steps up to a dairy, because in Winter these are slippery with snow and ice, and it is a severe tax on any person to carry heavy palls up a number of steps. The sink in the churning room should be provided with a pump from a cistern or well close by; a cistern is the best because it will receive the water from the roof and keep the ground dry about the foundation. A drain should be provided in the corner of the sink. Above the sink some racks may be made to hold spare milk pans, pails, etc. The milk-room is reached by a few board steps with a rise of not more than seven inches each. The shelves are ranged around the sides and a wide, low table is in the middle for the cream jars and to do the skimming upon. If deep setting is practiced less room will be required: But it will always be well to estimate for the largest possible amount of space and room in a dairy, and then make it still a little larger, In my experience in planning dairies for myself and others, I have never yet found one too large, but many that have soon proved too small.

Herdsman.

THE GOAT.

An effort has been made in England for some time to bring the goat forward as an object for greater consideration in agricultural circles, and, besides the British Goat Society, of which Lady Burdett-Coutts is patronness, the manager of the Alexandra Palace, a place of public entertainment, recently arranged an exhibition of some one hundred fine specimens of British and foreign goats, an illustration of some of which we have re-engraved from the London News.

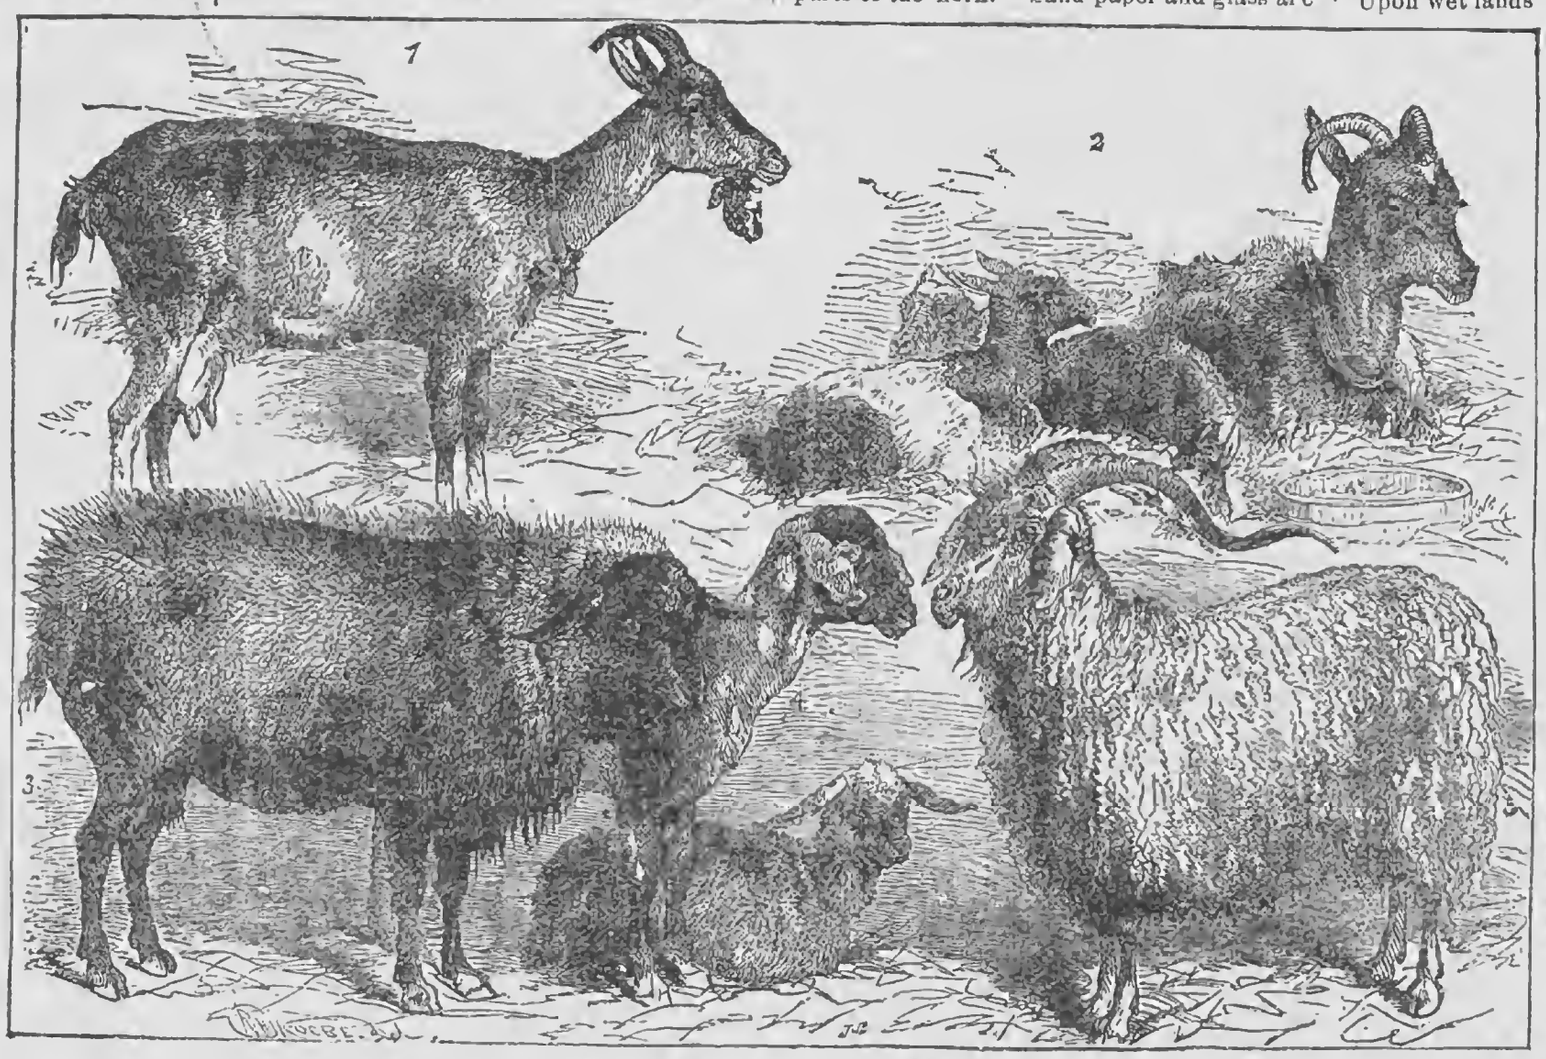
The illustration is of five of the animals on exhibition. Figure 1, is the common domestic goat, four years old, of which species one or more may be seen upon the small estates of most of the peasantry in the highlands of all the European countries, serving to supply milk and often meat. Campbell in the poem of the "Soldiers' Dream" of being at home again, has this suggestive line—

"I heard my own mountain goats bleating afar!"

The same species imported into America is the companion of the poor family from New Foundland to Central America, and is oftentimes the greatest blessing of the occupants of those poor hovels.

Figure 2, represents another domestic goat with kids. Figure 3, is a Hungarian goat belonging to Lady Burdett-Contts and is five years old. Figure 4, is an illustration of another belonging to Lady Burdett-Coutts, with kid. Figure 5 is an Angora goat two years old. The foreign species, with the exception of the Angora, do not seem to have been taken up for experiment as yet. There are several species of wild goat found in the East, and some few domestic animals are known which somewhat resemble the wild ones and a few of them were on exhibition.

What is expected to be gained by the consideration of the goat at this time does not appear. If for the purpose of improving or for the discovery of some more useful breed for practical husbandry, the world will wish the British Goat Society all possible success. There would seem to be material foundation enough in the goat family for some practical results; but it is apparently necessary to cross and breed out some of the more marked peculiarities of the animal before any favorable results can be hoped for. Certainly the rougher, rockier portions of all countries may well be the home of the goat provided the hair or milk or flesh or all these may be made a source of profit. The Angora is the most hopeful at present, but although experiments are being made with it in America, its raising does not yet seem to have become profitable away from the Pacific coast.



VARIETIES OF THE GOAT.—FIG. 351.

HORNS CRUMPLED BY ART.

There is nothing about the dairy cow that calls forth so many whimsical notions and tastes in breeders as the horns. The breeders of Angus and Galloways want a smooth poll—no horns at all. The Short-horn or Durham breeder and also the Jersey breeder want rudimentary, crooked, drooping or crumpled horns, like an old snag or gnarled root, antique and all awry, one turning into the jaw-bone below or lying back on the neck, the other poluting to the stars or reaching out straight forward, like the antennæ of an insect. The Devon breeder wants a bright, white, keen, scimetar-shaped horn—a villainous instrument for attack or defence, something that will make the blood run cold when the old cow shakes her head at you in the open field with no friendly hedge or tree in sight. Even the Devon does not rank first in horns, however; the Texan steer can give him two in the game and lead him by a foot on either horn. Here, however, there is some sense in horns, for often these cattle have to protect themselves from wild beasts, and a strong horn is their only defence.

But why have not these excrescences of civilization been bred off long ago? Of what earthly use are horns on a cow? The younger and weaker members of the herd are victims to these cruel instruments, and dealers in hides tell us that all pelts are injured more or less, the damage amounting to millions of dollars in the aggregate—by the marks or scratches that each animal receives some time in its life-time from the horns of another. This is a source of great perplexity and often of contention between buyers of hides and the tanner. Who has not made a visit to the stable and found the worst cow in the herd, as it always happens, loose and raking the sides of her helpless companions that are chained up powerless to protect themselves, their sides reeking with blood and perhaps a dead embryo calf or pierced udder as the sad result of too much horns on the head of the boss cow. On bulls these horns are doubly dangerous. Hogs, sheep, horses and human beings are the victims of these desperate and armed beasts. Polled bulls are as quiet as young heifers or old cows. It is the sense of power for mischief that instigates the evil disposition of a bull.

In producing new breeds of sheep the folly of horns has been recognized and they have been left off, though in this instance there is some cause to leave them on as a protection against the ravages of dogs. But why should

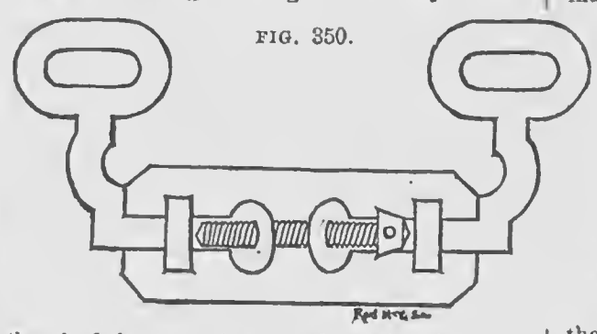


FIG. 350.

they be left on our improved breeds of cattle? The average Jersey cow has, as said before, only a rudimentary horn and it grows in any direction if left to itself, and is so soft she is almost certain to lose part or the whole of it before she has reached maturity. The shell often slips off so easily that it is impossible to tell how the accident could have occurred, and the cow's beauty is marred for life. This very softness of the horns makes it an easy matter to train them in any shape desired. The breeders on the island of Jersey have taken advantage of this, and often, if not always, put clamps, such as are figured above, on the horns to give them a uniform and crumpled direction.

This instrument is made of iron, consisting of a plate that fits against the forehead. The rings slip over the points of the horns, and the other end of the bar passes through staples in the plate, sliding backward and forward with the ends turned up and pierced by holes in which a thread is cut. Through these ends a long-threaded bolt screws, to constantly shorten up the rings. They are put on and screwed tightly, but not enough to hurt the animal. In three or four days they will be found to have become quite loose from the effect of the horns growing toward each other. The screw must then be tightened again or the clamps will drop off, and, if the animal is at pasture, be lost. They are tightened by passing the point of a nail into the hole in the end of the bolt and screwing it up. In a few weeks the most stubborn horns can be brought into the most graceful curves or "bug shaped." In connection with the clamps a coarse, half-round rasp should be used to take off all the rough, thick parts of the horn. Sand-paper and glass are too slow; a rasp will do the work in one-eighth of the time. A heavy, coarse horn on a Jersey is a great blemish. With persistent rasping the coarseness can soon be entirely removed. This is only a "fancy" point, but it goes a long way in making a sale to the average buyer. I have known it to add more than $50 to the value of a young bull and twice this amount to a heifer. The buyer may know how it is done and, in fact, see the clamps on the animal; but the pretty horns will still tempt him to buy. Care must be taken not to screw the clamps too tightly or they will break the bone of the horn.

L. S. Hardin.

STOCK NOTES.

BY A STOCKMAN.

The Hereford is now favored with a boom. I have had some hot discussions with friends of the Short-horn, in defending this breed which has been unjustly neglected, while the Short-horn has been enjoying its much inflated prosperity. The Hereford is an ancient family. It partakes with the Devon the honor of an old-time pedigree and history, and it bears its escutcheon, like the Devon, in its distinctly marked family features, which are reproduced with the greatest faithfulness.

The Short-horn is a made-up breed in comparison with the Hereford. It is fast becoming more distinctly marked in color, as the frequent roan becomes more fashionable; and the best families become more thoroughly intermingled with the rank and file. But it does not seem so well suited to bear the hardships of the plains as the Hereford, and the persistent work of the friends of the latter, notably of Mr. Miller, of Beecher, Illinois, has brought the meritorious white faces into popularity, and, as might have been expected, they are more than holding their own.

Beef and mutton are fast becoming the popular aliment. Our large foreign population, unused in their former homes and poorer circumstances to so expensive a food, are greatly increasing their consumption of meat. It is a fortunate thing, for it is a matter of history that the beef-eaters, the best fed people, have led the world in war and peace. And if the general consumption of beef and mutton will bring the United States into the position of the first nation of the world, or rather keep it there; or if, to take it the other way, the first nation of the world must eat the most beef and mutton, then there is a promising outlook for graziers and shepherds.

The gentle sheep has always been a wealth producer. The latter end of Job "was blessed, for he had 14,000 sheep," which would mean to one of us an income of just as many dollars per year, if not twice as many. What an investment for capital, that brings in 50 or 60 per cent. yearly, with almost the certainty that appertains to U. S. four-per-cents. A flock will easily increase 60 to 70 per cent. yearly, and half that will be compounded after the second year. This rate of increase is enormous and sufficiently points to the vast profits that are made from successful sheep rearing.

One of the greatest difficulties in keeping sheep arises from the attacks of the liver fluke. Upon wet lands and in very wet seasons, the danger is greatly increased. The past year has seen the English flocks reduced at least one-fourth by this destructive parasite. Only one known breed is proof against this pest of marsh pastures and low lands. This is the Romney-Marsh sheep, and it is curious that none of our speculative breeders has as yet made this sheep fashionable. Its value is not only in its adaptation to low lands, but it yields excellent mutton and a fleece greatly in demand for mohair and other lustrous fabrics.

Marsh lands are remarkably prolific in grass. To make such lands serviceable for sheep culture would be a vast advantage and economy. In that part of England where the Romney-Marsh sheep are kept the marshes are ditched, and even diked, to keep out the tide water; and on these exposed lands these hardy sheep feed in Summer and Winter. Some of these pastures are so luxuriant as to carry 14 sheep to the acre. What a sheep this would be for those of our farmers who think this animal is well provided for on the lee side of a straw stack! With this even they might secure their mutton.

Another breed that seems desirable for our purposes is the Dorset sheep which in England bears lambs twice in the year and has the habit of breeding at whatever time of the year may be desired. For market lambs what could be a more appropriate sheep than this? And yet this has been neglected.

Just at this season the wide-awake farmers, who keep their farms rich and make money in each hand, are picking up a few ewes from

each passing flock. They know at sight those which suit their purpose; young and thrifty, with small heads, broad loins and deep flanks; ewes which will bring a good lamb and fatten up rapidly when the lamb is weaned. A smutty face is a further commendation, for that is derived from a mixture of South-Down blood. Then they procure a good ram, or, having one, breed it to these ewes. Fifty ewes may cost now a matter of $200. With good care next year they will bring $250. The manure will pay for their care; the extra value will pay 25 per cent. interest on the money; the lamb will pay all the cost of the feed; and the wool will give a stock dividend equal to 30 or 50 per cent. What other business affords a better profit?

Industrial Societies.

THE ST. LOUIS FAIR.

[Rural Special Report.]

THE annual fair of the St. Louis Fair Association, at St. Louis, Oct. 4–9, was one of the most successful meetings ever held by that association. The display in all of the departments, excepting stock, was larger than usual, and the attendance was all that the society could wish for. On Wednesday there were over 40,000 people in attendance, principally farmers from Southern Illinois and Missouri. On Thursday there were 80,000 on the grounds, mostly from the city, as on that day all business was suspended and every one went to the fair.

The weather during the week was all that could be desired, and exhibitors and visitors were well paid for their atttendance. The association should endeavor to obtain better facilities for reaching the grounds, as this is the only objectionable feature at this fair. The grounds are four miles from the center of the city, and the four horse-car lines running to them cannot carry one-third of the people that generally attend on Wednesdays and Thursdays.

The show of cattle, though not as large as on some previous years, included some very fine stock. There were of Devons, 24 head, two herds; Ayrshires, 34 head, three herds; Jerseys, 114 head, eight herds; Holsteins, 16 head, two herds; Herefords, 31 head, five herds. The Missouri breeders did not come out as strongly as they ought, most of the cattle shown being from other States. The show of swine was very large and good, as was also the display of sheep. Floral Hall was well filled with a fine and choice collection of plants and flowers. The exhibit of farm and garden produce was also good.

The agricultural implement department carried off the honors, however. Here was shown farm machinery of all descriptions from every part of the country, covering several acres of ground. All the large machinery was shown in full operation, giving to the exhibit life and animation. A large number of traction engines were exhibted on the track, and the attention they received shows the interest the introduction of steam for farm use is attracting throughout the country. Large, attractive and permanent buildings were occupied and owned by such firms as Deere, Mansur & Co; the Moline Plow Co; the Oliver Chilled Plow Co; Koenig & Co; Ferd, Baur & Co; the Walter A. Wood Mower and Reaping Machine Co., and many others. These buildings, filled with all the latest improvements in agricultural machinery, were at all times surrounded by crowds of farmers looking for labor-saving implements. There was a number of new self-binders in operation. Plows—gang, sulky and hand—were shown by the hundred. Thrashing machines, portable engines, hay and cotton presses, clover hullers and all the larger kinds of machinery covered an immense space outside of the buildings, and were all practically shown. One of the pleasant incidents of the fair was the presentation of a handsome watch to Assistant-Superintendent, W. F. Schoenhard, by the agricultural implement exhibitors and attendants, in return for the accommodating spirit that he always shows in attending to the many wants of exhibitors in that department.

THE WHITMAN AGRICULTURAL CO., of St. Louis, made the largest and handsomest display of agricultural implements manufactured within the State of Missouri, and received the first premium, $100, for the same. They were also awarded three other first premiums, which covered all of their entries. Their Monarch and Young America corn and cob mills attracted a great deal of attention. The sale of these mills during the past Summer has been unprecedented. This company make only lever or sweep mills, and challenge competition. The grinding of corn and cob together has become a question which farmers must look into. We have had reports highly commending it as the most economical way of feeding, and the manufacturers of this class of mills are now competing hard for this trade. The Whitman Agricultural Co. claim that they make he only mill with the cast cast-steel grinder, and they warrant their mills to give good satisfaction. They will grind corn and cob, shelled corn, oats and other small grains, and can be regulated to make family meal. The Whitman Co., also showed a large variety of corn shellers, with a capacity of 10 to 300 bushels per hour; also a full line of feed cutters, horse powers, road scrapers and a large assortment of other machinery. The demand for their goods has been so large during the past season that they will have to increase their facilities, and they have already made arrangements to enlarge their works at the corner of Eighth Street and Clark Avenue, so as to be able to meet the increasing demand.

J. A. FIELD & CO., of St. Louis, made one of the most interesting displays. In addition to their large exhibit of agricultural machinery they had three of their Big Giant feed mills in operation. Two of them were run by horse-power, using their sweep; and the other, a geared mill, was run by a portable steam engine. They showed practically just what their mill would do, and also the improvements that have been made since they first started it. They now use cast steel grinders. Their automatic sifting attachment attracted a great deal of attention and is a valuable improvement, as it allows the farmer to sift or bolt his meal at the same time he grinds it, and make a fine grade of family meal. Messrs. Field & Co. now make five sizes of their celebrated Big Giant mills, from one-horse sweep to six-horse steam power. They had framed and on exhibition letters of inquiry and orders from nearly every part of the globe showing the world-wide reputation their mills have already obtained. Their foreign trade is rapidly increasing, while at the same time they have hard work to keep up with their home orders.

THE OLD HOUSE OF P. P. MAST & CO., Springfield, O., exhibited a large number of their celebrated machines. Their display included the Buckeye spring-tooth grain drill, Buckeye combined grain and fertilizer drills, one-horse grain drill, Buckeye cider mills, Buckeye walking and riding Cultivators, Plow Sulkies, etc. This house is one of the largest and oldest in the country, and their goods have a well earned reputation all over the land. All through the fair they attracted great attention and many large sales were made on the grounds for early delivery, as buyers find that when they want the Buckeye drills and cider mills they must order early. Messrs. Mast & Co., although running their large factory night and day during the past season, were utterly unable to fill their orders. They are now running a branch house in St. Louis to accommodate their large Western trade, and with increased facilities hope to be able to fill all orders promptly for next season.

THE VANDIVERE CORN PLANTER CO., Quincy, Ill., manufacturers of the "Vandivere," "Quincy" and "Barlow Rotary" corn planters, made a fine exhibit of their justly celebrated Barlow Rotary which attracted special attention. This planter has gone through three seasons, and its superior merits are fully established in the minds of all farmers who have used it. It is celebrated for correct drop, easy throw of bar and general ease of handling. There are fifteen chambers in the drop plate, and the corn can be seen for five hills in advance. This is a feature long desired and used only on this machine. It is adapted to any kind of check rower. As a drill planter the manufacturers claim that in accuracy of drop and ease of change from check row to drill, it cannot be excelled. Its success has been so great that the company has been compelled to largely increase its facilities to supply its trade for the coming season. At the Illinois and Ohio State fairs this planter was a center of attraction.

THE SOUTH BEND CHILLED PLOW CO., of South Bend, Ind., made a handsome display of sulky and hand plows in their tent. They had on exhibition 22 hand and three sulky plows all finished in elegant style that attracted a great deal of attention. These plows have met with a great success. The company commenced business in 1876, making that year 600 plows; since then they have enlarged their works four times, and claim that next year they will turn out 50,000 finished plows. Their "South Bend" sulky plow was put upon the market this year for the first time, and has made a fine reputation. It is very simple in its construction, and is celebrated for its lightness of draft and ease of operation. Its self-lifting attachment for raising the plow out of the ground is a positive motion, relieving the operator from all strain, and at the same time causing no side draft. A boy nine years old can operate it.

THE ST. LOUIS BRANCH OF THE GIBBS & STERRETT M'F'G CO., whose headquarters are at Corry, Pa., made their usual fine display of Climax mowers, reapers and droppers in their permanent building. They showed a full line of machines in motion, thus displaying them to full advantage and allowing the spectators to see for themselves the many points on which they have built up their good reputation. The motive power was supplied by one of their reversible ten horse-power engines with boiler. The boiler is a locomotive portable; the engine has a peculiar link motion that makes it very convenient to handle. During the past season they have added open guards to all their mowers and reapers. The Climax machines are gaining ground rapidly, and during the past season these enterprising manufacturers have had all they could do to fill orders.

THE FARMERS' FRIEND M'F'G CO., Dayton, Ohio, made a fine and handsome exhibit of their well-known Farmers' Friend force-feed grain drills and corn planters. Their grain drill is too well known to our readers to need a description. Their corn planter, which was awarded the first premium at the late Kansas City fair, attracted a great deal of attention. This improved rotary drop planter has a tilting lever by which it regulates the depth of planting and also holds the shoes in the ground; by its use the planter is governed perfectly in either hard, trashy or mellow ground.

THE JERSEYVILLE AGRICULTURAL WORKS, Robert Newton, proprietor, exhibited Davenport's new patent self-lifting sulky plow transmitting the powers at will from the end of the beam to the rotating axle for the purpose of utilizing the team to throw the plow out of the ground, thus making it effective, simple and durable, and so easily handled that a boy can operate it. This is a great improvement and the plow will prove a very valuable addition to the labor-saving machines of the West.

THE TURNBULL WAGON was exhibited by the manufacturers, Turnbull & Shelly, Defiance, Ohio. They made a fine display, having a full line of their farm wagons on Exhibition. They created quite a sensation by attaching Dillon's celebrated team of imported Percheron stallions to their exhibition wagon and driving it around the track. This wagon was made of oak and poplar and finished up in the handsomest style. Attached to the fine team of iron-gray stallions weighing 1900 pounds each, this made a very attractive showing.

N. P. CONE, general agent of the Mechanicsburg Machine Co., Mechanicsburg, Ohio, exhibited the celebrated Baker grain drill. Although this drill has been introduced in the West but two years, the sales the present season have been three times greater than last year's, and the company are now making large additions to their shops at Mechanicsburg, so as to enable them to fill their increasing orders. The popularity of this drill is well deserved.

MESSRS. NASH BROS. of New York and Harrisburg, Pa., exhibited their Acme Harrow. The pulverising and clod-crushing harrow we have often spoken highly of during the past season. Although a new thing here, it attracted a great deal of attention, many dealers returning several times to give it a more thorough examination. The fact that 3,200 of them were sold the first year and that every one put out gave good satisfaction, shows that this harrow is all that the manufacturers claim for it.

THE BIRDSELL M'F'G CO., SOUTH BEND, Ind., made a handsome show of their Monitor Jr., clover huller and separator in motion. The Messrs. Birdsells have been making clover hullers for the past 25 years, being the pioneers in the business. From a small commencement their factory has grown to its present large dimensions. They now have a capacity for turning out one complete machine every hour. The Birdsell machines are well-known all over the United States, and every year adds to their popularity. The New Monitor Jr. has already placed itself in the front rank.

J. E. PORTER, of Ottawa, Ill., exhibited his patent wire-cable hay derrick and the Porter wood-track carrier in full operation. Mr. Porter's display attracted a great deal of attention and for the third time in succession he received the first premium at this fair. K.

Miscellaneous.

ENCOURAGE THE BOYS.

I HAVE frequently seen questions which concern "keeping the boys on the farm" asked and discussed through the agricultural press. While I consider it a subject worthy of discussion, I also think its importance has been misapprehended by many. We do not hear the question so seriously considered in other vocations. If the merchant's son does not follow his father's calling nothing is said, or if the blacksmith's son and the carpenter's son do not respectively follow their father's callings it brings about no public discussions; but because a farmer's boys sometimes leave the farm in pursuit of some other vocation more suited to their tastes, it is taken for granted that they have taken an objectionable step.

It seems to me that it is the duty of every father to study carefully the natural traits of his boys, so as to find out, if possible, what pursuit in life they are naturally the most fitted for. This once found, he should give them opportunity to follow the calling for which he thinks them best adapted.

We don't want our boys to be farmers if their natural tastes turn to some other legitimate industry. If a farmer has a son whom he wishes to become a farmer, he should aim to make his child life on the farm full of pleasure rather than hardships. It is not surprising that boys who are compelled by a rigid father to toil early and late, indefinitely, in the drudgery that usually falls to the lot of farmer boys, when their developing nature needs sympathy and encouragement, find nothing in farming to attach them to the business. It is not their fault. They see only the dark side of farm life and miss all the pleasurable events which should stand as monuments in their memory for the remaining years of life.

Boys need encouragement, and if we wish our boys to become farmers, we must attach them to the business, or, in other words, cause them to like farming rather than abhor it. The boy who has a liking for farming will usually make a good farmer. Give the youngsters an interest in the farm proceeds, if possible. Let them do something for themselves; council with them and discuss the plans and affairs of the farm. A boy thus treated, if he has any business tact for farming, will show it and make a good farmer. If, on the contrary, he shows no inclination toward the business, and has a liking for some other legitimate industry, he should be encouraged in that.

Among the most interesting features that I remember in my life as a farmer's boy, are the opportunities my father gave me to do something for myself. When but a small child he gave a brother and myself a share in all the eggs we could find about the place. In later years he gave us each a garden plot and encouraged an emulation between us, as to which should keep his garden in the best shape, the management being left entirely to us. Every year we were each given a young calf or colt to raise, and when it had grown up it was sold and the proceeds added to our little store of funds. Such conduct would seem like child's play to many farmers who make a practice of getting as much work as possible out of their boys at the least cost or trouble. If farmers would begin early to vary the monotony of farm life for their boys and to encourage them in the ways above mentioned, there would be less complaint made of boys leaving the farm and fewer discontented young men on the farms of our country. G. A. G., JR.

Elmira, N. Y.

THE SUGAR PRODUCT.

THERE is a promising increase in the production of sugar as reported from different sections of the United States at this time. The importations of raw sugar into the United States are worth, in round numbers, $75,000,000 annually, and it is worth the while for our farmers to endeavor to produce all we need, instead of allowing it to be purchased abroad.

To pay for this imported raw sugar $75,000,000 worth of wheat and corn must, of course, be exported, which might just as well bring money, instead of money's worth, into the country. Added to this, there is an outlay of the cost of the transportation of the wheat outward and of the sugar inward, and the consumers of the imported sugar also pay upon it a duty of nearly $45,000,000.

If this sugar were raised at home, instead of raising so much wheat and corn, the freight charges would be saved, the employment of lands and the labor of the people would be more diversified, the soil would be less exhausted, because the refuse from sugar growing is greater than that from wheat. Sugar, too, would be lower in price, the people would have another industry to occupy the land, and one requiring the employment of more capital, machinery and labor.

If the same amount of fertility were brought back in the sugar, as is carried away in the wheat and corn sent to make the exchange, the only net loss would be in the cost of transportation; but such is not the case; the crop of corn and wheat is far more bulky and represents a much greater degree of fertilizing element than is brought in by the raw sugar, while that brought in by sugar importations does not find its way to the land, but is lost. Added to this there is much land suited to sugar beets, sugar cane and sorghum, which is not suited to wheat, while there is prospectively greater profit in the cultivation of these than in wheat. The question of home sugar product bids fair to have a favorable solution at an early day.

The Water Supply.

East of the Alleghany Mountains there is a serious complaint of low water in the rivers and streams, wells drying up, etc., which calls for some earnest consideration on the part of scientists. The disappearance of the forests may not be the cause of a lighter rainfall, but that and the draining and reclaiming

of the land, have destroyed the natural reservoirs for feeding springs, and allowed the water from rains and melting snows to run off immediately instead of soaking into the ground. What shall be the remedy is the question. Steam may be used in place of water power, and the vast wind power blowing to waste is not as yet utilized, but the barren hills and drying stream beds call for a greater reservoir supply either natural or artificial, and such must needs be arranged for at no distant day. If, instead of draining the swamps these depressions had been excavated ten feet in depth and made into ponds, it would have given a partial reservoir supply, and in thousands of places there are natural depressions which may now easily be made to hold water, but the work must be extensively and systematically done to afford a complete remedy. B.

These Promised Book Premiums.

In the RURAL of the 16th inst., I find Conrad Wilson's explanation about the book premiums. Now I did receive the three papers and book, but I was not aware that they were sent in place of the book premium. I did not so understand it. I acknowledged the receipt of them and think they were very good papers; but I take the RURAL NEW-YORKER and I got from it all the information that was in the other papers, and a great deal more. I wrote twice to the Farmers' Publishing Company and asked for information (inclosing stamps to pay postage), and never got any answer, and I have received only the three papers and the little book. I had about made up my mind that the Farmers' Publishing Company was a fraud, so I thought that I would ask the RURAL. I knew I would get an answer from it.

Now, Mr. RURAL, I question the right of Mr. Wilson to make the change he did. I tried to fulfill all that was required in regard to the corn premiums, and did so to the satisfaction of the RURAL and through it I got the Challenge Feed Mill promptly. GEO. W. STRONG.

Davenport, Ia.

ANOTHER PREMIUM.—A friend writes us from Union, Broome Co. N. Y.—"I have from the RURAL Free Seed Distribution a splendid lot of beets, some of which are very large. I took the premium on beets at our fair, and hope to capture that RURAL prize also. Only one of the raspberry plants lived but that has made a splendid growth. Five out of the seven willow cuttings lived and have thriven finely. The Ennobled Oats did well, and received a great deal of praise at the fair. They were not thrashed, but they looked excellent."

NOT A BIT OF DOUBT OF IT.—A friend and well-known agricultural writer says:

"I am glad to hear you were so successful at the Mineola Fair, for you unquestionably fully deserved it. Every farmer on Long Island ought to take the RURAL—it is doing so much for them, and they sadly miss their own interests in not doing so."

BRIEFLETS.

WE are receiving many congratulations upon our yields of corn. . . . . Professor Beal improves the keeping qualities of white onions by using for seed only those which keep the longest in the Spring without sprouting. . . . . Now is the time to arrange Winter gardens for the kitchen or sitting-room. They may consist of flower pots simply—of soap or any other boxes that happen to be in the cellar or about the premises. It is easy to decorate these with moss, evergreen cones or something of the kind, so as to cover their ugliness. Then sow lettuce and radishes. An azalea, pink, violet, pansy or other plant that thrives in a low temperature, may be introduced to make such little gardens attractive. . . . . Gladiolus bulbs are best kept in paper bags in a room over 32° and less than 45°. Tube-roses are best kept in a warm room—say between 60° and 70°. Seed potatoes are best kept in dry sand in a temperature just above freezing. All roots may be kept well in this way. . . . . Where roots are stored in cellars we should avoid making the piles too deep. Nothing sooner promotes heating, fungoid growth, dampness and decay. . . . . Pits for keeping mangels, turnips, beets, potatoes, etc. should be dug on ridges or at least on high, dry soil. They may be dug three feet deep and wide. After storing the roots, cover lightly with straw or hay—then earth and finally boards, so slanting and overlapping as to shed the rain. As Winter advances increase the amount of earth. . . . . Remember the advice we have often given *not* to cover strawberry plants too early. The object of covering is not to keep them warm—or yet to keep them cold—but rather to assist in preserving a uniform temperature and to retard the action of both heat and frost. A good time to cover strawberry beds is *after* the first hard freeze of Winter. . . . . Let the covering be as light as possible and yet cover the plants. Salt hay is excellent for this purpose—straw, leaves, the finer parts of corn-stalks, evergreen branches or long manure may also be used. Laths or slender pieces of wood should be laid over the covering to retain it in its place. . . . Major Freas's method of protecting trees against rabbits and mice is to bandage them with any old cotton or woolen cloth—for mice, eight or ten inches high; for rabbits, two feet. . . . . It would not be surprising if Four-o'clocks were again to become fashionable. Already we find among the proprietors of costly grounds some who have never seen them—know not what they are. Marvel of Peru is another common name for this plant, the botanical name being Mirabilis Jalapa. . . . . Belle de Nuit it is called in France. We find in English catalogues eight different sorts, viz., yellow-striped, scarlet, white or silver-striped, purple, sweet-scented, white and gold variegated leaved. The roots are perennial; the flowers bright and showy and the plant of quick growth and round, branching habit. . . . . The Rural Branching Sorghum is at this date, Oct. 16, as green and fresh as ever. We are again cutting that which was cut in mid-August. It is now two to three feet high. . . . . What right has a man to fret or scold over poverty so long as he can find money to buy whisky, tobacco or cigars? We know of a grumbling farmer who, though not too poor to buy whisky, is yet too poor to provide his hard-working wife with the necessary comforts of life. Do such people ever take the above view of it? . . . . . The Syracuse Herald says that the report that Alice Oates is to be offered the position of Professor of Husbandry at Cornell University lacks confirmation. . . . . Dr. Eagan has given immediate relief in every instance for rhus (sumach) poisoning by topical application of fluid extract of Grindelia robusta, either pure or diluted as exigencies demand. As the RURAL stated a year or so ago, physicians use this also for asthma. . . . . As stated elsewhere, we would be pleased to forward to any of our readers who may apply the RURAL NEW-YORKER "Poster" for 1880–81. We should be glad to have one of these tacked up in the barn or carriage house of every one of our subscribers. . . . . Very few of our agricultural contemporaries have mentioned our yields of corn. Having the good of agriculture at heart, it might be supposed that they would hasten to present the facts to their subscribers. . . . . The great London (England) seeds house of Jacob Wrench and Sons writes to one of our seedsmen as follows: "We are sorry we cannot order the Beauty of Hebron Potatoes unless you can guarantee that there shall be no dead beetles in them, as they are undoubtedly a grand potato in every way—especially flavor." (!) . . . . . The following is a copy of a letter from the Commissioner of Agriculture, Gen. Le Duc, to the firm that will next year offer the White Elephant Potato for sale; "My opinion of the White Elephant Potato is shown by the expression now of my wish to learn what quantity you have for sale, and the price asked." . . . . . Prof. Roberts tells us that 50 bushels of wood ashes per acre increased the yield of grass more than any other manure—ground bone improved the clover. . . . . Mr. E. H. Libby (late editor of Land and Home and previously of the American Agriculturist and Scientific Farmer) says in the Christian Union, that "a worse thing could happen than for the recently organized 'New York Experiment Station,' which, has done no work, has no foundation, no laboratories or trained specialists, to unite with the Cornell University Experiment Station, and give the latter its present and prospective funds." (!) . . . . . A lady traveler remarks that the cleanliness and order on board ship, where all the work is done by men, including that of the kitchen and the care of the cabins, almost convince her that woman has mistaken her vocation in attempting to grapple with housework.

WHAT OTHERS SAY.

THE amount of capital employed in British agriculture, inadequate although it often is to secure the fullest returns, is enormously in excess of that required in ordinary farming throughout the States. So says Mr. Finlay Dun of England.

HOUSE and buildings there cost less than half the amount expended upon them here, he continues. Great tracts of country are in little need of artificial drainage. Where frost for three months secures an adamant way of ice, and Summer drought for a still longer period gives firm transit over meadow and prairie, expensive roads are little needed. The herd law, in force throughout many States, forbids cattle being turned out without a keeper, and diminishes the need of fencing. These conditions obviously economize outlay. For £3 an acre American farmers are generally supplied with the requisite buildings and permanent equipments which in England cost £10.

NEW METHOD OF PRESERVING RAW MEAT.—A new and apparently most valuable method of preserving raw meat, discovered by Professor Artimini, of Florence, and patented in England, promises to have a great effect upon their markets. According to a report by Professors Barff and Mills, of the Glasgow University, and Dr. Stevenson, of Guy's Hospital, meat six months old was found to be perfectly sound and good, the muscular fiber unchanged and the nutritive properties unimpaired. The material employed is said to be less expensive than salt and not only wholesome but pleasant to the taste.

INCUBATORS.—"We recently heard it affirmed," the Mark Lane Express (England), remarks, "that incubators were being used by every poultry breeder in the country, and that these machines were a great success, both of which statements are untrue. The makers of incubators have to sell their articles, and they endeavor by every means to induce people to purchase them. But it is very doubtful if a purchase is ever repeated. The real facts are that the large and more successful breeders of poultry will not use the incubator, as they know from practical experience that a few good sitting hens, costing only a few shillings each, are more to be trusted, give less trouble and bring up the chickens stronger and better than when these are hatched in an incubator, and reared under artificial mothers. The competition is now so keen amongst poultry exhibitors, and the desire to win a cup at the Crystal Palace or Birmingham so great, that if these incubators were actually found to be better adapted for hatching and rearing chickens than a hen, they would at once come into general use, and the broody hen would have no duties to perform except to lay eggs."

HOG KILLING IN CHICAGO.—Professor Sheldon (our occasional English correspondent) is now visiting this country. The following account is taken from the Live Stock Journal of London:—"In Chicago I visited the meat-packing establishment of Messrs. Armour & Co., which is situated close to the Union Stock-yards. This establishment is said to cover an area of over twenty acres, and is, of course, the largest of its kind in the world. . . . . An inclined and covered way leads from the stock-yards to the upper story of the slaughter-house, and up this plane the pigs are driven direct from market. A pen holding about fifty of the doomed porkers is situated nearest the place where they are knifed, and outside this one are two or three others adjoining the top of the plane. In the pen first mentioned two men are posted, whose duty it is to slip a chain-noose around a hind leg of each pig; to this chain is attached a swivel, which hooks on and slides along a horizontal bar of iron overhead. Immediately a pig is noosed he is hoisted in the twinkling of an eye some three feet clear of the floor, by means of a chain and pulleys, the chain for the moment being hooked near the noose on the pig's leg. Here the swivel is placed on a bar of iron, and a shove is given to the pig, which travels a few yards along the bar of iron, clearing a low door which separates the pen from the slaughter-house proper. In the latter stands a man who is armed with a sure blade of steel, and, as the suspended animals glide past him, he gives each one of them the *coup de grace* with singular dexterity. In a moment the deed is done, and the pig glides along, beating the air with his helpless feet, the blood flowing out in a stream against the sides of the pen, until he fetches up a few yards away against a whole gallows-ful of earlier victims. Sometimes the man with the knife takes a flying shot, and again a pair of them, but each time his aim is deadly and instantaneous. It is considered a fair day's work for this man to stick 3,600 hogs, but he has done as many as 5,000 in a day. . . . The earlier part of the process I have been describing is indescribably revolting, with the yells of the dying pigs and the streams of blood which fly about in all directions; but the latter part, after the disemboweling processes, is conducted with all the decency and cleanliness possible in such a place. Here the men are cleanly in dress and person, whereas in the earlier stages such a condition is impossible. But everywhere system and order reign and labor-saving appliances are used wherever possible.

STANDARD CURRANTS AND GOOSEBERRIES.—The standard currants and gooseberries which were displayed at the Centennial excited a great deal of interest. It was then claimed for them that borers would not trouble the MISSOURI stock upon which they were worked and that the finest foreign kinds would not mildew. We purchased half-a dozen, paying, as we remember, $1.50 each. We found that, though the currants bore well and were curious as ornamental plants, all of the gooseberries mildewed in spite of the free use of sulphur. Our report to this effect was not received at the time in a very friendly spirit and was attributed, in one case, at least, to "hasty conclusions." Now, however, that two years have passed since our report, Mr. H. G. Hooker of Rochester, who, as we remember, was the first to offer them for sale, writes to the Gardeners' Monthly as follows:—Currants and gooseberries will grow and bear heavy crops when worked high (or low) upon the Missouri flowering currant stock, but the stock is not stiff, and always requires a stake to maintain it upright. The fruit is not better or less liable to mildew when worked in this manner; and such plants must always be very high-priced, as they are difficult to work and the stocks need age to make them stout enough to stand well. They are curious, especially when currants and gooseberries, both red and white, all appear in one head upon a tall stem, and that is all the recommendation they will bear.

THE GROUND CONTACT OF LIGHTNING-RODS.—We find the following in the Journal of Chemistry: In a recent article in the Journal of Telegraphy, the noted electrician, David Brooks, argues that the subterranean section of a lightning-rod should be enlarged in as great proportion as the earth's specific conducting capacity is less. A half-inch square rod, in his opinion, should have a ground-plate no less than 270 feet square. In lieu of this, there should be a connection with gas and water pipes. He adds that after thirty years' observation he has never known of a case where the occupants were injured when the building was fitted with gas and water pipes. The buildings were sometimes set on fire by the electric fluid passing from the lightning-rods or metallic roofs to the gas-pipes, but there was no injury to persons in any part of the building below the higher points to which the pipes extended. His general conclusion is that gas and water pipes are the best lightning-rods ever erected, because they are electrically in perfect connection with the earth. They should extend to the very top of the building, or be connected by a rod running to that elevation.

A NEW VINE.—The London Times has the following: A French explorer, M. Lecart, who is at present on the banks of the Niger, writes home from "Koundian (Gangaran), July 25," that he has discovered a new vine, which promises to be of great economical value. He says the fruit of the vine is excellent and abundant, its cultivation very easy, its roots tuberous and perennial, while its branches are annual. It can be cultivated as easily as the dahlia. He himself had been eating the large grapes of the vine for eight days, and found them excellent; and he suggests that its culture ought to be attempted in all vine-growing countries as a possible remedy against the phylloxera. He is sending home seeds for experiment, both in France and Algeria, and will bring home specimens of the plant at all stages. It is not without danger that M. Lecart has been able to make this discovery, as he states that the people of the Soudan are in a state of great excitement and apprehension at the many attempts of white people to penetrate into their country. The story of the last expedition sent by France into the south of Algeria has spread to all parts, and the conviction of the natives is that the travelers are collecting information preparatory to conquest. Perhaps the natives are not very far wrong.

Everywhere.

"BEYOND THE MISSISSIPPI."

THE artice "Beyond the Mississippi," by Bessie Victor, in a late RURAL, tends to mislead rather than instruct. She should have given the town and county that are commented upon; then the reader could learn something about some particular locality. Anyone would naturally infer that Adair Co., Mo., was the place described, which is not at all the case. Adair County has no surplus of grapes to make into wine, no Limburger cheese, no beer garden and but very few German residents that are not good citizens. We have no licensed saloons; drug-stores only are open on Sundays. There are no excursions on Sundays, and but few dances or horse races, at least of an objectionable type. Bessie seems to see the wrong side of the picture. Nothing is said about the good citizens of the community. The article is certainly a good one to encourage immigration, but not to this locality. Adair County acknowledges no superior in the West for morals, educational advantages, health, good water, good crops of grain, grass and fruit. We have in Kirksville, the county seat, a State Normal school—tuition free to all—enrolling about 500 students a year; a public school of eight divisions; also one jail and nine churches, all orthodox. In the county there are about 65 district schools, and nearly all are used for preaching, unless the neighborhood has a church. There are also four cheese and butter factories that do good work, while there are some creameries that make butter exclusively and ship it to St. Louis. We have a first-class flouring mill and stores and groceries in abundance. We need a foundry and machine shop and a plow and wagon factory to make matters complete. Our

county is about two-thirds prairie and one-third timber. There is an abundance of building stone and stone coal. We have two railroads, one from St. Louis north, and the other from Quincey west. Improved land can be bought for $10 to $25 per acre; wild land for $5 to $10. There is no place in the northeast part of the State that offers greater inducements to immigrants than Adair County. We have scores that have been father west and northwest and who have returned satisfied to stay here. Our population is made up largely of Eastern people, and we claim to have got out of the old-fogy rut that was worn deep in slavery times. The people are now free, happy and intelligent.

Kirksville, Adair Co., Mo., JAKE.

RURAL SPECIAL REPORTS.

KANSAS, Ellinwood, Barton Co., Oct. 10.—The prospects for Western Kansas, at present, for a full wheat crop next year, have not been so good for the five years that I have been here. On October 2 we had very good rains, so that the farmers have again begun plowing to put more wheat in. The area of wheat sown is larger than last year, and it comes up at once. Last year much did not even sprout. The corn crop is far below an average this season. A heavy frost on October 4, killed the late vines, such as squash, etc. J. G. S.

MONTANA, Warm Springs, Deer Lodge Co., Oct. 10.—Grain crops have been badly damaged by hail, and will yield only about one-fifth of an average crop. The hay crop is larger this year than last. Potatoes are a fine crop; the average yield all over this valley is fully 300 bushels per acre. Last year I had poor luck with the RURAL'S Beauty of Hebron, saving only six tubers, which I planted this year and dug one bushel this Fall. The RURAL'S mangold are splendid; all the people here want some. They weigh from eight to thirteen pounds apiece. Farmers are through with haying and grain cutting and are thrashing and gathering their potatoes and root crops. A. J.

MO., Tipton, Moniteau Co., Sept. 24.—Our corn crop was light. Fruit is abundant. Wheat was considerably injured by chinch bugs; sowing the Fall crop is very nearly all finished. M. S.

N. Y., Farmer Village, Seneca Co., Oct. 18.—We have had a very dry Summer. Wheat crop, good; corn, ditto; oats and barley rather short, owing to dry, hot weather at the time of heading; very little seed clover in the county. A great deal of Timothy has been sown this Fall. Fall wheat does not look well—not much top and it is turning yellow from drought. A great deal of phosphate is used in this part of the county; very little wheat is sown without it. Apples are plentful and cheap, selling at from 50 to 75 cts. per barrel; windfalls, 10 cts. per bushel at the dry house. Fall pasture is short; hay scarce and high; straw in great demand. W. M. C.

N. Y., Jonesville, Saratoga Co., Oct. 19.—Fall rains have hitherto failed us, and water is scarce; many wells are dry and some farmers have to drive their stock a considerable distance to water. Crops in general were fair. Hay and potatoes, however, are light. Fall feed has been very poor. Hay sells at $16 to $20 per ton; oats, 45c. per bushel; potatoes, $1.25 per barrel; butter, 28 to 3.c. per pound; pork, $7 per 100 pounds. The ground is so dry that we cannot plow. F. B. W.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Choice Peaches.

G. H., Bossardsville, Pa., asks, 1, the names and a description of the best varieties of peaches for market; 2, the names of three or four varieties of peaches that ripen about the same time—September 1—in that section. Monroe Co., Pa.

ANS.—We can devise no better reply to the queries of our friend, than to refer him to the lists and recommendations of John Rutter, of West Chester, Pa., to be found at pages 86 to 88 of his book, recently published with the commendation of the Pennsylvania Fruit Growers' Society. Mr. Rutter's long experience, on the spot, *ought* to be a guarantee for the soundness of his advice; although it is to us a matter of astonishment that the society should become committed to such a medly of crudities, not to say ignorance, as appears upon its pages. We cannot even commend his list of varieties, without a measure of dissent. Amsden's June and Alexander (both included in the list) are, for all practical purposes, identical; hence one may be omitted. Downing and Wilder are yet too little known; while, last year, they ripened with the foregoing, and were in no respect better. Beatrice is too small for market, hence of doubtful value for the purpose. Hale's Early is under similar condemnation, on account of its strong tendency to rot before maturity. For these reasons, these varieties, if planted at all, should certainly be planted but sparingly till their success shall be more fully assured. George IV. is a very fine amateur peach, ripening in advance of Early Crawford; but it lacks the firmness of texture so essential in a market peach; and hence if planted for this purpose, it should be because of a lack of others to fill its particular season. Yellow Rareripe may mean any one of quite a number of varieties to which this name is applied; hence the planter should assure himself as to its identity before planting. Susquehanna is a large, beautiful and excellent yellow peach; but it has been charged with persistent lack of productiveness; and for this reason, it should be employed with caution. Salway. Late Heath and Headly (?) are commended as October varieties; and may be expected occasionally, in unfavorable seasons, to ripen imperfectly. They would, doubtless prove more satisfactory farther south. The peaches recommended by the N. J. Hort. Society for general culture are: Crawford's Early, Honest John, Large Early York, Mountain Rose, Stump the World, Old Mixon, Crawford's Late, Morris Co. Rareripe, Smock, and Keyport White. The four last named are late varieties.

The Agricultural Colleges in the United States.

E. E. B., Manor, Texas, asks us to publish a list of all the agricultural colleges in the United States where boys can pay for their education by their work.

ANS.—In all our agricultural colleges, so far as we know, some fees are charged all the students, and in all of them the latter have to pay for their own board. In most of them, however, wages are paid to those among the students who work on the college farms. Full information as to the terms on which students are admitted can be obtained by writing to the president of each college, and for the convenience of such of our readers as may desire to obtain such information, we here give a list of all the agricultural colleges in the country.

Colleges with no farms are marked with a star.

Fruit Houses.

Rev. V. Le Roy Lockwood, D. D., Ann Arbor, Mich., writes us: "We have in our city a 'pomological society,' composed of many fruit growers, especially of peaches. This is a very fine region for this fruit, and this season the yield was unusually large, as it was indeed everywhere else. We had two weeks of very hot weather accompanied with much rain and dampness. It was impossible to gather and ship the fruit crop at once, and the market became glutted, while great quantities perished on the trees. Hence our society feel the need of some way of protecting and preserving the fruit for a few days in such emergencies until the market is relieved, the weather cooler and prices more remunerative. This season's experience shows that nearly all the profits are lost under such circumstances. We have been discussing the feasibility of making a large union fruit-preserving house where all interested could place their peaches in baskets on shelves for a few days, when necessary, and so have them in good condition for the market when the great pressure is removed. Now we have only some vague hints as to the best mode and plan for making such a house, but no practical experience. Can you put us in correspondence with proper parties, or refer us to any book or paper containing such plans, instructions, etc., as we need? I believe there are some patented houses for such purposes. We prefer a house which it will pay one or two individuals or more to erect without paying a patent royalty. Are there any such within your knowledge?

[We have no information of any value upon the above subject, and therefore publish the letter so that those who have may reply, if they will. Eds.]

A Southern Cow.

G. S. H., Warthen, Ga., asks, 1, what is the best cow for milking purposes; 2, what kind of food is the best for milk; 3, how many pounds of food can a cow consume per day; 4, what is a cheap and convenient plan for building stables for stock; 5, what is the average weight of a grown bronze turkey; 6, where can such turkeys be had; 7, where can four-gallon cows be purchased and at what price.

ANS.—1. For Georgia the Ayrshire would be found the best in all probability, or perhaps a high-grade Jersey; but the Ayrshire is very hardy and will keep in good order where other cows will not. 2. In the Southern States wheat bran and cotton-seed meal, two quarts of each daily, with grass, corn fodder, green or dry hay; or cow-pea vines would be excellent food and easily procured. 3. Such a cow as could be kept in the South, that is, one of the smaller breeds, as Ayrshire or Jersey, would consume 60 pounds of grass or 15 pounds of hay daily with the meal above mentioned. 4. There is no cheaper or more convenient plan of stalls for stock than the dairy sheds described in the article on The Dairy Cow, page 634. 5. Bronze turkeys weigh from 12 to 40 pounds, according to breeding and feeding. 6. These turkeys are quite common and can be procured of any poultry dealer. Study the advertising columns. 7. Sixteen-quart cows are very plentiful and can be purchased for $50 upwards. Doubtless a short advertisement in the business columns of the RURAL NEW-YORKER would bring you several offers of such cows.

Vomition in a Cow.

A. W., Southold, Suffolk Co., N. Y., has a yearling heifer that appears well and has a good appetite, but she vomits during the night nearly all the food she has eaten during the day. In what she throws up stones as large as a crow's egg, have been noticed sometimes. His cattle are well supplied with good water drawn three or four times a day; but this beast will drink the drainage from the cow yard in preference. She does not appear to fall away in flesh, though she has been vomiting in this way for about six weeks.

ANS.—This is a very rare condition and due to a depraved appetite, probably induced by indigestion. Confine this animal in a stall that she may eat only what is given her; feed light but nutritious mashes, *not cooked*, with a small quantity of Timothy or other good hay. Give a mild purgative, from half a pound to a pound of Epsom salts, after which, give with food, daily for a month, sulphate of iron, one drachm; nux vomica, one half drachm and ground anise-seed, two ounces.

Compost of Ashes and Cotton-seed.

B., no address, asks whether hard-wood sawdust and unleached wood ashes will make a good compost if mixed with one-tenth by bulk or weight of cotton-seed meal.

ANS.—This compost would not be advisable. It would be too concentrated and too dry. If you can procure muck from a swamp and use 10 parts of this with one part each of ashes and whole cotton-seed, you would have a good compost. Whole seed is preferable to the meal for this purpose, as the hulls are rich in potash and phosphoric acid. It would be best to burn the sawdust and convert it to ashes and use these. Sawdust is too dry and encourages dry-rot in manure or composts; it does not rot soon in the soil, and there is little in it that is valuable except the ash. If swamp muck or pond muck is not available, the earth from a cow-pen or the black soil and decayed leaves from woods might be used. The heap should be kept moist.

Billygoattawny.

V. G. F., Flushing, L. I., asks the meaning of the above word which he styles long, odd and unpronounceable, and which he lately found in a description of the dishes at a dinner.

ANS.—If our correspondent will divide this word into three parts, he will find it easily pronounced. "Billy," the first part, is the name usually given to a domestic "he" goat. The second part is "goat." The third part, "tawny," may mean the color, which, if so, should be written with e left out. The name Billygoattawny was given to a dish of kid or goat soup, served up as one of the dishes at the "Kid Dinner," lately partaken by the members of the British Goat Society, when they held their superb show of goats at the Alexandra Palace in England, reference to which was made in our last issue, and is again in this.

Patent Bee-hives.

C. C., Damascus, Pa., asks for the names of the various patented bee-hives, if any, as he is informed that there is no patent on any hive now, all having "expired." He and several of his neighbors would make the "American" and several other hives, if they were sure that they would not infringe on a patent by doing so.

ANS.—There are a few features patented in certain hives; for instance, Shock of Iowa, has a patent on the porous walls to his hives; Geo. T. Wheeler, on the shoulders on his frames, etc., etc.; but when the Langstroth patent on movable frames "ran out or expired" in 1876, all that was practical in bee-hives became public property. There is no patent of any description whatever on the American, Langstroth, Quinby, or Gallup hive, and these are the best hives in use at the present time.

Miscellaneous.

W. H. C., Springboro', Ohio, asks, 1, whether clematis can be propagated in this country and, if so, how; 2, do we know anything about a preparation called "Ozone Preserving," advertised in a Western agricultural paper.

ANS.—1. Clematis may be propagated by cuttings, grafting, layers or seeds. Seeds germinate slowly, requiring generally from six months to two years. The cuttings should be placed in sand and subjected to bottom heat. The finer kinds of clematis are best grafted upon vigorous-growing stocks. Upon their own roots they ofttimes prove feeble. 2. The number of fresh nostrums that are being constantly introduced to the dear public is too great for us to "keep track of" any of them, unless our attention has been specially called to it, hence we at present know nothing about the above preparation.

F. E. B., Keene, N. H., asks, 1, the address of Gen Le Duc, Commissioner of the National Sheep and Wool Exhibition; 2, the best place to commence sheep raising on a capital of $900.

ANS.—1, Washington D. C. He is the Commissioner of Agriculture. 2, Some parts of Georgia, Tennessee, Alabama, Texas, California, Oregon and the Western Territories, are especially adapted to raising sheep profitably, as are many other sections; but success depends on so many contingencies that it would be unwise for us to recommend specially any particular locality.

A Subscriber, Bedford, N. Y., asks, 1, whether air-slaked lime is as good as unslaked lime for composting with swamp muck; 2, whether it will pay to buy lime at $1.50 per barrel for that purpose.

ANS.—1, Yes if placed in layers very thin and fine. But unslaked lime is always lumpy, which would make its action too fierce in some places. Better slake the lime by water. This is better than air-slaked lime. 2, If the land needs lime, yes; if not, farm manure, ashes, fish, flesh, blood, offal, night-soil, bird dung or potassic fertilizers had better be used. See article, by Prof. Storer, entitled "A Scientific View of Composts," in the RURALS of Aug. 7. 14 and 28, especially the last, and "The Value of Lime in Composts" in "The History of a Poor Farm" in RURAL of Nov. 15th, 1879.

T. B. N., St. Joseph, Mo., referring to our statement, in a late issue, that the sod of the field on which grew our great yield of Indian corn, was plowed under in early Winter and thoroughly harrowed and rolled last Spring, asks whether it would be well to break prairie now for corn and harrow it in the Spring.

ANS.—We cannot answer this question better than by saying we shall plow our field intended for corn next season (now in pasture) as soon as our more pressing farm work is completed.

L. H., Warren, O., asks for full instructions in flax culture.

ANS.—The article on this subject under "Field Crops," was written in answer to this and several other inquiries on that topic, all of which are answered in one part or another, of the article.

W. H. J., Newark, N. J., asks whether the suckers from old Strawberry plants are as good to set out as young and vigorous plants.

ANS.—The young plants are produced from suckers of the older ones.

J. B. A., Collingwood, Canada, asks whether the magnolia can be wintered out-of-doors, or must it be housed.

ANS.—It must be housed in your climate.

M. N. N., Hermitage, Mo., sends a specimen of an apple for name.

ANS.—The apple, though well packed, was wholly decayed when received on Oct 15.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, OCT. 30, 1880.

It may be well for us to announce that we have begun to prepare special numbers of the RURAL NEW-YORKER for 1881, devoted first, (January) to Indian Corn; second, (February) to Strawberries; third, to selected Hardy Plants suitable for country home grounds; fourth, (early September) to Wheat. These numbers will be amply illustrated from nature, and we now solicit articles for them from those who have made such plants a special study or have valuable items of experience to communicate. We do not desire long articles or descriptions of those ordinary methods well-known to all good farmers. Those who favor us will kindly mark the MSS "For Corn Number"—"For Wheat Number," etc. We have now growing at the Rural Experimental Grounds seventy-five kinds of wheat, as many of strawberries, a very complete collection of hardy ornamental woody plants from which to make our own notes, while from our happy experience with corn during the past season, we hope to impress upon our readers some valuable teachings.

SPECIAL NOTICE.

MANY of our subscribers are sending us the required amount of postage stamps (six cents) requesting us in return to send the White Elephant Potato, as if additional postage were required for the other seeds or a separate application necessary. We beg our readers to understand that six cents are all we ask from them for the *entire* distribution—the rest of the postage the RURAL pays. Applications may be made from now until March. Write the name and address plainly and say "SEND SEEDS." That is all we desire except that our friends will not stick the postage stamps to their letters.

OUR readers generally, with every horticulturist and pomologist in the country, will regret to learn of Mr. Chas. Downing's loss by the death of his wife, which occurred on the 18th inst., and all will sympathise with him in his bereavement.

READERS of this journal will recall our remarks as to the disappointment, which most farmers experience who estimate the *yield* of Clawson wheat by its *appearance*. As compared with Fultz we have shown that this difference is owing to the fact that the spikelets of Fultz bear three, sometimes four, kernels, while Clawson spikelets bear an average of only less than three. The number of grains to a spikelet or floret in wheats is an important item to which we would call the careful attention of farmers. As supporting what we have said against Clawson, we present the following extract from the Seventh Annual Report of the New Jersey State Board of Agriculture. "*The Clawson wheat showed the largest heads and the tallest and heaviest straw.* On thrashing we got 39 bushels of Clawson wheat, which is at the rate of 19½ bushels per acre; 244 bushels of Fultz wheat, which is at the rate of 30½ bushels per acre. The same marked difference in the yield of the two varieties has been found for three or four years in succession."

THE DUCHESSE PEAR.

WE cannot advise our friends in selecting pear trees for new orchards or for the garden to choose the Duchesse. It may be granted that at present it is one of our most profitable market sorts. But we learn from fruit dealers that it has not sold as readily this season as in past seasons; while, on the other hand, more Seckels than ever before have been sold. For the very reason that the little Seckel is steadily growing in favor, the Duchesse is losing ground. In other words, the public are learning (though slowly indeed) that the size of the Duchesse is a poor equivalent for the quality of the Seckel. Duchesse pears *must be* of the largest size or they are worthless. Grown upon pear stock, we find that they shrivel in spite of our best efforts to ripen them, while even upon the quince (dwarf) they require plenty of manure. Judging of this pear by our own experience, we are forced to the conclusion that it has seen its best days and that its reputation even as a market variety is and deserves to be in "a rapid decline."

"THE SERE AND YELLOW LEAF."

THE gorgeous beauties of the Fall of the year are not only charming but instructive. To the young they show only a perfection of color and blending of tints which delight the eye by their brilliancy. To those of maturer years they convey a soberer pleasure which appeals to the higher sensibilities. "The sere and yellow leaf" has been too often considered as betokening the infirmities of age creeping upon us, denoting enfeebled powers and the warning of an approaching dissolution. The popular mistake that it is to the effects of a killing frost that this exquisite coloring of leaf is due, only helps to carry out this delusion. But it is the ripening of the foliage, the maturity of its age, the full service of its purpose in creation, that brings about its beauty and magnificence. Thus considered, "the sere and yellow leaf" must not be applied in its popular sense as the withering of decay, as the termination of a by-gone life and the end of all usefulness. On the contrary, it signifies but the accomplishment of a purpose in life, the end of a busy season, the beginning of a season of quiet and rest.

THE FLAX INDUSTRY.

ONE of the most promising openings for a new business is offered to those who will establish depots for receiving and curing, preparing and classifying flax fibers. There are a great quantity and variety of flax straw now grown, but there is wanting a system with machinery for curing and preparing the fiber.

There are no mills weaving fine linens, but there are two or three making crash and several large thread and yarn and twine mills—one at Mechanicsville, N. Y.; one in New York City; smaller ones in different places, while a branch of the Barbour thread mills of Ireland employs some 500 hands at Paterson, N. J., and Messrs. Finlayson, Bausfield & Co., of Scotland, have, also, during the past year established a branch manufactory of threads at Grafton, Mass.

In these mills something over two million dollars' worth of raw flax is used, the greater portion of which is imported, because our flax growers do not systematically cure and classify their product. But little of the flax grown in the United States is of a character to suit these mills. Flax grown for seed is too coarse, but the straw may be used in yarn and to mix with foreign fiber, if it be properly prepared and classified according to color and fineness.

The suggestion of depots for receiving the flax straw from farmers is made in the belief that companies making it a business could afford to put in modern mechanical appliances for the purpose, and in time a system of preparation and classification would grow up, as well as the opening of a market for the fiber when prepared. Added to this, our farmers would be led to grow flax for both seed and fiber, and also for fiber alone.

CANADA GOING TOO FAR.

IMPORTATIONS of cattle from Canada to Great Britain have considerably increased during the time the latter has enforced restrictions on importations from this country. It is only natural, therefore, that the Dominion, while not at all anxious that the embargo on our cattle should be removed, should be very anxious to avoid any cause for the establishment of similar restrictions on its own trade. Solicitude on this point is doubtless the chief cause of its absolute prohibition against the importation of cattle from this country. England declares that, to guard her own herds against contagion from ours, not only must no cattle be imported beyond the ports of debarkation directly from the United States, but also that none shall be introduced indirectly through Canada; and that any attempt to do so will cause the enforcement of a like embargo on cattle from that country. Such a threat would justify our neighbors in placing upon cattle importations from this country restrictions as stringent as those they enforce against importations from other infected nations. But while they permit the introduction of cattle from Great Britain, France and other countries whose herds are notoriously infected with pleuro-pneumonia and other contagious diseases, after a ninety-days' quarantine, it seems unneighborly, nay, unjust, that they should prohibit absolutely the importation of cattle even from our Western States which have hitherto remained wholly free from pleuro-pneumonia. If a quarantine of ninety days is considered sufficient to guard their herds from contagion through imported European animals, why should not a similar quarantine be equally efficacious as regards animals from this country? We do not pretend that our condition as friendly neighbors affords any claim for exceptional consideration, but we do insist that it should not subject us to an exceptional hardship, and the attitude of the Canadian Government towards us in this matter is so inconsistent with its conduct towards more distant nations that our Government should at once make a strong protest against a discrimination so injurious to our interests, and, we honestly believe, ultimately to those of our neighbor. Even self-interest does not justify injustice.

THE BUSINESS OF EXPERIMENTING.

EVERY person knows, who has a gift or a taste for experimenting, that it is an unprofitable business, so far as money is concerned. It is expensive of time and money, and, as time is money to most of those whose tastes lie that way, the cost is doubly great. Occasionally one fortunate individual strikes a good thing, just as the originator of the Concord Grape or the Early Rose Potato did. Most people spend a life-time and find nothing to reward their labor and perseverance. But even when a real "bonanza" is found, it brings but little reward to the discoverer or producer. The public gets the benefit; the person whose labor has been spent gets the empty honor, and his virtue is its own reward. This is, perhaps, unavoidable, but it is not fair; and, being unfair, it is objectionable, and therefore operates to disgust people with this sort of employment.

It is easy to perceive that the successful originator of an improved potato, root, grain, or fruit, is as much a public benefactor as the inventor of an improved process, machine, or implement. The public has gained many millions of dollars from the Rose Potato and the Concord Grape, but what have been the rewards of the originators? In the nature of things it is difficult, if not impossible, to protect a plant as a machine can be protected, by a patent. But why should the public be averse to recompensing those who have labored long and industriously for its benefit? Probably no person engaged in agriculture is, or has ever been, averse to the fair and just compensation of those persons from whose industry and skill important benefits have been derived. The difficulty does not exist in this direction, not in any unwillingness to return the obligation, but in ignorance of any practicable manner of doing this. Much has been thought, said, written and proposed upon this question, but no solution has yet been reached.

There is no reason why the subject should be forgotten, but every reason why it should be carefully considered until some method may be devised for the continued employment of experimenters, in the hope that we may secure still further advantage from their investigations. There is no doubt that the promise of a substantial reward for success in this way would encourage and stimulate those engaged in experiments of this kind to more devoted efforts. The State of New York has liberally appropriated the handsome sum of $20,000 yearly for two years for the support of experiment stations. There is no doubt whatever that if one-tenth part of this sum should be devoted to the encouragement of efforts to produce new and improved varieties of vegetables, grains or fruits, it would have a beneficial result. The money might possibly be used in the shape of awards for the production of some notably excellent new variety, in some such manner as that by which the American Institute has a standing offer of a premium for some striking mechanical discovery or invention, of whatever kind it may be, so long as it is manifestly worthy of the reward. If such an arrangement had been in existence, there is no doubt that some very useful services might have been rewarded to some extent, and however inadequate it might have been, the reward would have been beneficially bestowed. It is enough that we keep this matter in view, for its fuller consideration, without going so far as to offer any defined proposition for its development.

BREVITIES.

ON the 19th a frost occurred at the Rural Farm which killed cow-peas, Rural Branching Sorghum, sweet potatoes and tender plants generally. The thermometer was 34 deg. at 6.30 A. M.

UPON our several plants of the great Cuzco Corn, there was *one* ear which we hoped *might* mature a grain or so. After our frost of last week, seeing that the end of the season of growth had arrived, we pulled and husked that ear. The *cob* was four inches long. There were no kernels.

MR. Douglas says that the Wild Black Cherry (Prunus serotina) is one of the most rapid growers of all our valuable Northern hardwood forest trees, making lumber almost equal in value to the Black Walnut. It grows freely on any dry land, even if too poor for agricultural purposes. It is healthy everywhere, of upright growth and is very easily transplanted.

PROF. BUDD of Iowa, has said—speaking of the American White Ash—"A grove of ten acres, thinned to six feet apart, containing twelve thousand trees, at twelve years, were eight inches in diameter and thirty-five feet high, the previous thinning paying all expenses of planting and cultivation." This is, in fact, one of the most valuable trees for forest planting.

THE Roman Hyacinth is white and about a week earlier than the others. But the single flowers and the racemes as well are smaller. We might compare them to ordinary hyacinths after they have bloomed three years in the open ground. The Muscari or Feathered Hyacinths are very beautiful and yet rarely seen. As things of curiosity those who grow this class of plants in the open ground or for forcing, should try them.

SEVERAL subscribers ask us whether it is worth while for them to compete for our premium for the largest mangel grown from our Free Seed Distribution. To these we say that we have not yet compared the sizes mentioned in the statements already sent in, and even if we knew the largest size given we would not think it fair to tell it yet. Let every one who has succeeded in growing an exceptionally large mangel forward his statement. A postal card doesn't cost much.

AT a recent stock sale of the Duke of Portland, at his magnificent seat of Welbeck, ham sandwiches made up a part of the lunch furnished on the occasion. Within a few days after this, four of the persons partaking of the sandwiches died, and 60 to 70 became seriously ill. A post-mortem examination discovered nothing poisonous in the food, nor any trichinæ, and its fatal effects remained a mystery till some one thought of examining the room in which the food was kept the night before it was eaten. Then the "murder was out," for in it is a long open drainage channel covered simply by a grating. From this came the poison, which infected the ham made up into sandwiches, causing the four deaths and so much sickness. It is surprising that such an open drain can be found in so magnificent a building as Welbeck Abbey, inhabited by so intelligent and good-hearted a man as the Duke of Portland. But the late Prince Albert of England caught his death from a sewer pipe in a still more magnificent building—Windsor Castle.

THE recent gale on the coast of Florida, in which the steamer Vera Cruz was lost, played havoc with the orange crop on Indian River, as the following extract from a private letter from Rock Ledge will show. "The cyclone destroyed over half of the finest orange crop ever grown on Indian River. With no storm I think our oranges would have been *par excellence* in every respect—size, perfection and quality. From 600,000 oranges that would have been shipped over this route, we now come down to 200,000. This loss could have been nearly all avoided had the earlier settlers only left sufficient timber to serve as windbreaks for the protection of their groves. Major M.'s *little* grove was not hurt, being well protected in this way. In his *big* grove, with no protection, half the fruit was blown off. G. H.'s, ditto. Mrs. D. lost 80,000 out of 100,000; no protection at all. But there will be some oranges left, even in this district. My own I thought very fine, and they gave promise of being exceptionally so. A good many that were left are scarred so as to mar their uniform beauty, yet I shall have a few fine boxes if no other calamity befalls them. Weather delightful now, only rather warm."

No grain has been exported from the Baltic ports of Russia since September 1, but several cargoes have been already imported and more have been ordered. From Odessa, in the Black Sea, to Taganrog, in the Sea of Azoo, little or no wheat has lately been received from the back country, which usually supplies the greater part of the wheat for exportation. Reports received at St. Petersburgh from the various provinces give a gloomy view of the prospects for food during the coming Winter: shortage and failures of crops are nearly everywhere announced. It has become a problem how the government can keep the inhabitants of many districts from starvation, and measures looking to that end have already been inaugurated. Since our article on "Our Prospective Wheat Market" appeared in our last issue, we have received trans-Atlantic "exchanges" containing Dr. J. B. Lawes's estimate of the present wheat crop and the probable demand for foreign wheat the coming season in the United Kingdom. We estimated the average yield per acre there at 28 bushels; he puts it at 28½; we figured out the requirements of foreign wheat there at 114,000,000 bushels; he thinks it will be about 112,000,000. Considering that we proposed to give only an approximate statement, and that his can only be an approximate estimate, there's very little difference between these two entirely independent statements. The more we learn of the European wheat market, the stronger is our conviction that the prices of wheat here will remain at least firm, if they do not advance considerably.

Literary Miscellany.

THE SONG-BIRD'S DEPARTURE.

AROUND the cedars and the lawn
The evening mists are early drawn,
On each its cobwebs glittering bells
At noon of Autumn's cold breath tells:
The woods their golden mantle wear
To grace the passing of a year;
Saddest of all, resounds no trill;
From blithesome warbler—all are still.

The cuckoo long ago has fled,
The blackcap dulled his sable head,
The whitethroat sought more sunny climes,
The fearful swallow left betimes;
O'er barren moor or stubble bright
The wood-wren wings her silent flight,
While many a whistle from the skies
Marks where the plover southward flies.

What guides these birds to warmer lands?
Doth chance impose such strict commands?
Did myriad races die before
Survivors sought a foreign shore?
Not so! Creative Love impressed
Upon their natures His behest,
And still, obedient, they observe
The charge, nor from His purpose swerve.

We grieve, but lasting song would cloy
Capacities of sober joy;
And though we mourn the silent bands
Of birds which flit to stranger lands,
Brighter the welcome we extend
Next April to each well-known friend,
And more we long 'mid Winter's snow
To hear new songs when lilies blow.

INMATES OF LESTER HALL.

(Continued from page 710.)

CHAPTER XIII.

"I HAVE asked Carewe to dine with us this evening," said Mr. Daton, a few days after, as he entered Mattie's boudoir, "to celebrate your coming downstairs again, Mattie, dear—your first dinner with us for so long."

"I am so glad you have asked him, Uncle Henry!" said Mattie, smiling. "I shall be delighted to see him, and was just wondering why he had not been to see us for so many days."

"He has been worked to death!" said Mr. Daton. "He is getting to be quite a celebrated man in his profession, and very deservedly so. I am sure we have every reason to be thankful to him, and to speak highly of his skill, have we not, Cecil?"

"Every reason," said Cecil, briefly.

She was sitting on a low chair, with her hands crossed idly on her lap, and her eyes fixed on the red gleam of the fire.

"I hope you will be civil to him, my Lady Disdain," said her uncle smiling.

"I generally am," she rejoined, carelessly.

"Indeed, yes. I think Lawrence finds favor in your sight, Queen Cecil," said Mr. Daton, gaily. "And no wonder, for he is morally and physically one of the finest fellows I ever met!"

"I did not know you valued men by the length of their limbs or the power of their muscles," said Cecil, disdainfully.

Mr. Daton laughed, as he glanced over at the graceful figure, and noticed the hot flush which rose in the soft cheek.

"Nor do I, my child," he answered, gravely, in a moment. "Lawrence Carewe's life would be equally noble in my eyes—equally grand and self-denying—if he were a hunchback! But I do not think that he would be so in yours, Cecil," he added, smiling, as he put his hand caressingly on her shoulder.

Cecil put up both her hands, clasping them over his, and drawing it down to her lips in silence. Whatever she was to others, to her uncle she was always gentleness itself.

"You like him so much, Uncle Henry?" she said, with a touch of regret in her soft voice.

"I like him—I honor him deeply, and I should be very sorry that sorrow should come to him through any one connected with me," he said, meaningly; and the flush died away in Cecil's cheek as she heard the words.

She answered nothing, but touched her lips softly to his hand again, and her uncle read that mute caress to mean that his interest in Dr. Carewe was pleasant to her.

"If she loves him I will give her to him with every confidence," he said to himself, as he went down to his own den—the only simple, unadorned room in the superb house—where he wrote his letters, kept his accounts, and interviewed his niece's suitors when obliged to do so. "But he must not take her from me; I cannot give up my Cecil."

For some minutes after he had left the boudoir there was silence between the two sisters; then Mattie looked up suddenly and said:

"What do you mean to do, Cecil?"

"To do! About what?"

"About Dr. Carewe?

"About Dr. Carewe!" repeated Cecil, lifting her pretty eyebrows with a puzzled expression which was wholly assumed.

"Yes," said Mattie, quietly.

"What do you mean, Mattie?" said Cecil. "Are you speaking in enigmas?"

"Nay, there is no enigma," said Mattie, quietly still, but with a pained expression her sweet blue eyes. "You must know what his feeling toward you is."

"Must I?" laughed Cecil, rising languidly.

"Of course you must!" said Mattie, rising also, and speaking more vehemently than was usual with her. "Oh! Cecil," and she drew near her sister and put her arm fondly round her, "he is too good, too noble to be trifled with! Do not wound such a heart as his!"

Cecil looked down at her for a moment with a sudden gleam of pain in her lustrous eyes; then she laughed lightly.

"My dear little sister," she said, gaily, "do you think every man who comes near is going to be idiot enough to fall in love with me?"

"Lawrence Carewe has done so," said Mattie, gravely, "You know it, Cecil!"

"He has never told me so," said Cecil, evasively.

"As if it needed to be told in words!" said Mattie. "You know it, Cecil."

"I do not choose to know it until he tells me so," said Cecil, impatiently. "Upon my word, I am getting quite tired of the mention of his name! One hears nothing else in this house from morning till night?"

"Cecil," said Mattie, gravely, "I owe my life to him!"

"Nonsense, any other doctor would have done the same!" said Cecil, coldly. "He himself says so."

"Because he is all generous, all noble," said Mattie, gravely; "Cecil, do not make him suffer as others have suffered. He is worthy a better fate."

"I cannot be responsible for his folly any more than I can for the folly of a score of predecessors."

Mattie's arm fell from its clasp and she turned away.

"I do not know you, Cecil!" she said. "You are strangely unlike yourself!"

"Am I" said Cecil, and into her lustrous eyes came the old shadow of pain as she put out her hand and drew her sister, half reluctant as she was, to her side. "Am I? How, Mattie?"

"You seem so cold, so heartless. Oh, Cecil, it is not possible that you do not love him when he loves you so greatly!"

"Does love beget love? she answered slowly. "Is that your experience, Mattie?

"But he is so noble, so true," said Mattie almost despairingly.

"Not nobler, not truer than many others," said her sister, calmly.

"Cecil, you have no heart!" said Miss Lester, indignantly, as she withdrew her hand from her sister's; but Cecil caught it again in hers, and turned her face to Mattie with an expression of such hopeless, despairing misery upon it, that all her anger melted, and she put her arms around her sister.

"Oh, Cecil, dearest, what is it?" she said, anxiously. "I did not mean to hurt you."

For a moment Cecil rested her head against her shoulder in silence, the great salt tears gathering slowly in her eyes, and her lips quivering with some painful thought; then she rose slowly, and loosed her sister's gentle clasp.

"Let me go!" she said, hoarsely; you cannot understand. I hardly understand myself sometimes; but you need not pity Dr. Carewe," she added, with unconscious bitterness. "It is not he who deserves pity—or, at least, not he alone."

As she spoke she disengaged herself, touched Mattie's cheek with her lips, and left her puzzled, and surprised, and touched, but without a clue to the truth; while Cecil, rushing to her own room, burst into a passion of tears.

Poor, unhappy Cecil! She was tasting even now the bitterness of her error. Her revenge had recoiled on herself, and, although she knew it not, she was laying the foundation-stone of her own misery in the fulfillment of her vow.

CHAPTER XIV.

THE VOW KEPT.

"Will not somebody be charitable, and give us some music?"

Dinner was over, and they were sitting in the small drawing-room opening into the conservatory, and a pair of tall footmen were handing tea and coffee with ponderous solemnity, while Mr. Daton leaned back in his armchair half asleep; and Cecil, looking wondrously beautiful in an exquisite demi-toilette of soft Indian muslin, trimmed with a profusion of lace, with no ornament about her save a knot of blue ribbon nestling in the lace at her throat, was sitting on a low seat by her uncle, her fingers clasping his.

Mattie and Mrs. Audley were busily engaged over some intricate Chinese puzzle which Mr. Daton had brought home that afternoon, and the two young men, Mr. Edgar and Lawrence Carewe, were standing, coffee-cup in hand, talking, when Cecil uttered the remark with which our chapter opens:

"Will not some one be charitable, and give us some music?"

"Take pity on yourself," answered Sir Edgar, laughingly, while Lawrence Carewe went forward to take the empty coffee-cup from her hand. "We have not heard the sound of your voice for ages, Cecil."

"Have you not?" she rejoined, gaily. "I am not in the humor this evening, Dr. Carewe; may Mattie sing us something?"

"Not to-night!" the doctor answered, smiling; "but she may play an accompaniment for you, if you will be so good."

"I always play my own," said Cecil, languidly, as she rose from her seat, and moved across to the piano. "Nevertheless, I will sing if you will promise to sing after."

"Do you sing, Dr. Carewe?" said Mattie, quickly. "Why did you never tell us, and how did Cecil find it out?"

"I guessed it," Cecil answered, turning her lustrous eyes on the doctor's face with a little smile in their depths. "You see I can read you, Dr. Carewe," she added, as he bent for a moment to open the piano.

"Can you?" he said, in a low tone, but with a passionate tremor in its low, tender note. "Can you guess, I wonder, that which I dare not tell you?"

She glanced at him, and smiled again—a slow, lingering, sweet smile: then she turned from him abruptly, and putting her white, jewelled hands upon the keys, played a gay prelude.

"What are you going to sing, Cecil?" said her sister, looking up for a moment from the carved ivory toy between her fingers.

"You shall see," said Cecil, gaily; and then to an air in whose gay strains ran an under current of sadness, sang the following words:

"'Woman's faith and woman's trust,
Write the characters in dust;
Stamp them on the running stream,
Print them on the moon's pale beam
And each evanescent letter
Shall be clearer, firmer, better,
And more permanent, I ween,
Than the things those letters mean.

"'I have strained the spider's thread
'Gainst the promise of a maid:
I have weighed a grain of sand
'Gainst her plight of heart and hand.
I told my true love of the token,
How her faith proved light and broken;
Again her word and troth she plight,
And I believe again ere night.'"

"I don't like that song, Cecil," said Miss Lester. "It does not suit you either. Now, doctor, it is your turn."

"Do you mean that as a warning, Miss Cecil?" said Lawrence Carewe, as she rose and relinquished her place to him, and in his low tone there was a tremor of intense feeling.

She drew back a little, and the beautiful face paled, and over its loveliness came a dark shadow of pain, of tenderness, almost of remorse. Then she smiled.

"As a warning, as a challenge, what you will," she said, carelessly. "Are they not true words?"

"It may be so; Heaven only knows!" he said, as, seating himself by the piano, he struck a few chords with the power and brilliance of a thorough musician.

"I do not know what to sing," he said, breaking off suddenly with an uneasy laugh, and his quiet face stirred with a deep feeling unusual to him.

"Let it be anything you like," said Mattie smiling. Dr. Carewe I feel angry with you for having hidden your talent from our knowledge!"

He laughed again, and his eyes went longingly to Cecil where she stood in her long, softly-flowing muslin dress and the little gleam of azure silk at her white throat. His glance lingered on the picture as he sang.

Then the rich, melodious voice died away, and Dr. Carewe turned from the piano with a light in his proud, gray eyes, and with a flush on his cheek; there was a momentary silence as he ended, during which he saw that the graceful, white-robed figure had disappeared; then Mattie said a few words of thanks and approval.

"It will take a good deal to make me forgive you, doctor," she said gaily. "You have deprived us of a very great pleasure all these weeks. Mr. Edgar, why did you not tell us how well he sang?

"Because I dont like to be surpassed," said he, laughing. "Go on Lawrence; now that you have shown us your power, we won't let you off. You see, Cecil has escaped; quite overcome, but she is quite within earshot in the conservatory, so go on, like a good fellow. Play us something now—you play as well as you sing!"

Dr. Carewe turned to the piano again and began to play—playing he scarcely knew or heeded what, letting his thoughts run riot as his fingers moved over the keys; pouring out all the tumult of his feelings on the senseless notes. Mattie listened entranced where she sat, while Mr. Daton slumbered quietly in his armchair.

And the rich, tender melodies were finding their way to another listener's ears, and to her heart; for without, in the conservatory, Cecil heard, with a quiver on her lips, and a wonderful light in her eyes, the prayer, the pathos, the entreaty he was pouring forth in music; and for the moment her evil purpose was charmed away from her, even as the melody of David's harp exercised the evil spirit from the heart of the Israelitish king of old and her eyes grew humid and tender, and her color came and went, as she leaned her head on her hands, and listened to the music as it rose and fell.

By-and-by it ceased—gradually dying away in a slow, mournful wail, and the musician rose abruptly from the piano.

"Thank you—thank you," said Mr. Daton, opening his eyes with a start, and rousing himself from his slumbers. "Dear me, how well you play, Carewe! I had no idea you were such a musician! Why, where is Cecil?"

"She is in the conservatory, I think," said Mattie.

"All alone?" said her uncle. "That won't do, Carewe, go and see after her, will you? I'll say good-night now, as I have some letters to write."

So saying, Mr. Daton left the drawing room, and after a momentary hesitation, Dr. Carewe disappeared in the direction of the conservatory, leaving Mr. Edgar and Mattie in that blissful dual solitude which is so delightful when two people understand and love each other.

The conservatory in which Lawrence Carewe disappeared was a double one—at least at one end of it there was a second division curtained off, and furnished with some pretty, luxurious lounging-chairs, a table, and a low couch. This inner conservatory was at all times a favorite resort of Cecil's; and it was here that Dr. Carewe found her.

She started slightly as he entered, and laughed a little nervously as she looked up.

"How you startled me, Dr. Carewe!" she said, gaily. "You have made my heart beat dreadfully!"

"Did I startle you?" he said, tenderly. "I am very sorry; I did not mean to do so. Pray, forgive me!"

She glanced up at him and smiled, then moved aside her fleecy white draperies, and made room for him on the couch by her side. He sat down in silence, his heart throbbing quick and fast. The silence lasted for a moment, then Cecil spoke.

"How well you play," she said, carelessly, without glancing at him. "I had no idea you were such a musician."

"That I have pleased you is only too great an honor," he said, gently.

"You are becoming quite a courtier," she answered, with some languid amusement in her manner. "What has changed you so, I wonder?"

"What?" he said, with sudden passion, turning to her quickly. "Need you ask? Do you not know, Cecil?"

She laughed slightly.

"Perhaps I can guess, but I cry you mercy, Dr. Carewe. I am surfeited with pretty speeches, false and true; at least," and she turned to him with one of her sweet, bewildering smiles, "I can claim exemption from them from you."

"You can claim what you will from me, and it is yours," he said, while the passion in his heart forced its way upwards to his throat, and made his voice tremble as he sat there by her side.

"What I will? You give me a wide margin, Dr. Carewe,' she said, while over her beauty there came for a moment a troubled shadow. "Are you sincere?"

"Sincere?" he echoed, passionately. "You know that I am. If it were my life you asked for, it is yours—do with it what you will."

The words were brief enough, but the look which accompanied them said more than volumes could have done, and meeting that glance the rich color faded a little in Cecil's cheek.

"You take one back to the old chivalrous days," she said, lightly; "but you talk very foolishly, Dr. Carewe. Your life! what should I do with such a gift, and what payment could I make you for it?"

She spoke lightly and carelessly, with all her old languid grace and some little amusement; but as she spoke she turned her face towards him and smiled into his eyes, and the color came and went in his face, while mad words rose to his lips in reply, words which it required the strongest effort to restrain, but which he checked—he dared not speak them yet—although the room seemed to turn round about him, and a mist seemed to hide her from his sight.

Cecil saw his emotion and guessed what was the purport of the words he would have spoken; she felt the burning glance of his eyes, as they dwelt upon her; she could hear faintly the beating of the passionate heart as he sat by her side, and she knew that her triumph was at hand—that the words which Mattie's illness had arrested on his lips on the night of the ball would be spoken now, spoken with tenfold passion in proportion as his love had grown since that day; and she would not spare him—spare him through whom her brother sinned and fell? Never—Nay! though she had seen nothing unworthy in him, though even in her eyes he seemed noble and true beyond all nobility and truth, she would keep her vow—he should suffer, pang for pang, "an eye for an eye, and a tooth for a tooth!"

Silence fell upon them as they sat, the death-like calm which often precedes a storm; and in that silence a chill fell upon Cecil—a strange, sudden foreboding, as she remembered the words he himself had spoken to her:

"Revenge, at first though sweet,
Bitter ere long, back on itself recoils."

And as she recalled them, an involuntary shudder ran through her, and shook her from head to foot.

He turned to her quickly, with swift anxiety. "You are cold—you shivered!" he said, hurriedly "May I get you a shawl?" You will not return to the drawing-room yet?"

"Oh! no, I am not cold," she answered, with a smile. "Did I shiver? It was your fancy! I am not cold. See—feel my hand!"

She put out her hand to him, and touched his with her slender, jewelled fingers, and at the touch his calmness fled—he caught it in his, and raising it to his lips, covered it with wild, passionate kisses, which burned like fire on the soft flesh. She bore the caress in silence, then she withdrew her hand from his slowly, and turned slightly away. Could it be that she loved him?

"Cecil," he said, brokenly, "Cecil."

For a moment she answered him nothing—perhaps in that moment she felt a pang of compassion for the suffering she was about to cause; but if she did, she conquered it, and turned to him with a smile of bewildering sweetness, and said, softly:

"Well?"

"You are not angry?" he said pleadingly.

"Angry!" she repeated. "Why should I be angry?"

"Why?" he echoed, passionately. "Great Heaven, is it true—is it true that you will listen to me?"

He took her hands in his once more, he bent his head low over them, and laid his lips upon them in one long passionate kiss; in the silence she could hear the rapturous beating of his heart, the heavy breathing as they came from his lips, and she sat, silent, pale indeed, with a strange, fitful pallor, bearing his kiss, his touch, that her triumph might be yet more perfect—her revenge yet more complete!

"Cecil," he said, in a moment, mastering his excitement by a strong effort, and speaking with some degree of calmness, "it is no new thing to you to have poured out at your feet the whole love of a man's life and heart; it is no new thing to you to hear that I love you with all my heart and soul, and strength. I have had no hope until now. I know myself to be so unworthy of you—that I have fought against that love for my life. I have struggled—Heaven knows how vainly—to conquer it. But now! oh! my darling, you do not repulse me—you do not send me from you—you do not reject that love, and my happiness seems greater than I can bear."

"Does such love exist now-a-days?" she said, in a low tone, as she turned her eyes upon him for a moment. "Has it not died with the poetry and, chivalry of the past?"

"I know not," he said, wildly—"I care not. know only this—that I love you as a woman was never loved; and that for your love, to win you as my own, I would give my life—my very soul!"

"Oh! hush," she said, quickly and tremulously "No woman is worthy of such love as that."

"Worthy or not, it is thus I love you, Cecil," he said, passionately. "Who says you are not worthy?"

"I say so."

"You! Ah! my darling, how can you judge?" he said, with a faint smile, as he sank down on his knees before her, his hands clasping hers still, his eyes looking upward to the beautiful averted face as if they would read her soul. "Ah! my love, answer me," he said, hoarsely, "just one word to put me out of my pain?"

"You know but little of me," she said, in a low tone, as she bent towards him for a moment, wondering why his passionate words thrilled her with such joy and pain—why his trust in her was so sweet with such a wondrous sweetness, and yet bitter as gall. "You cannot tell——"

"I love you!" he said, simply, as he bowed his head on her hands, and silence fell upon them once more as he knealt there. For a moment she bent towards him with a wonderful tenderness filling her lustrous eyes—then she drew back slightly, the beautiful face set and hardened until it was motionless, as if carved in stone, and she drew her hands softly from his clasp.

"Rise!" she said, in a chill, gentle voice. "Do not kneel there; I have something to say to you."

He looked up quickly; there was a certain hesitation upon her face; her eyes were dark and troubled; her mouth firm and set. Something in her manner chilled him. The glow faded from his face, as, in obedience to her request, he rose and stood before her.

What was it she was about to answer him? On that answer hung the joy or sorrow of her future life.

For a moment there was a silence, and then Cecil spoke, and even as on her face the tenderness had died away, even so the softness and sweetness had left her voice, and left it hard, and cold, and metallic.

"You say that you love me," she said, calmly; "and I have no reason, neither do I wish, to doubt you. That you love me I believe; others have done so ere now—others whose love I have not striven to win; while for yours I have striven—I say it frankly. Nay, do not interrupt me," she added, quickly, as he was about to speak. "You think it was to return your love that I strove to win it. You are mistaken."

"Mistaken!" There was a passionate, wounded incredulity in his voice; an agony of doubt and fear in the great eyes that sought hers. "Mistaken!" he repeated, passionately. "Cecil you are mocking me, are you not? You are too noble to betray, and your own lips tell me that you tried to make me love you!"

"And I succeeded, did I not?" she said with a smile—a smile so chill, so cold, so mocking!

"Succeeded! Great Heavens! could you fail?" he said, passionately. "But you are mocking me now, Cecil, are you not? Ah! love, forgive me that ever for one moment I doubted you. You love me a little, at least. Forgive me, I must have mistaken your words. My brain seems on fire, I know not what I say or what I hear!"

He stooped over her, and tried to take her hands, but she prevented him, and rose from her seat.

"Wait—you are premature," she said, coldly. "You do me too much honor in deeming me too noble to trifle with a man's heart. You see I am capable even of such baseness at that."

He looked at her in dumb, incredulous pain. Deep as his love had been, his faith in her truth and purity; and the wistful glance of his eyes, the touch of his hand as he laid it for a moment over hers, prayed for denial of the words she spoke.

She shook off his hand as if its touch burned her, and lifted her eyes full on the colorless face of the man who loved her with such a passionate love.

"When you were loving me," she said, pressing her hands to her heart as if to repress its passionate throbbing—"when you were with me, did you ever think, or did you quite forget, whose sister I was, and what was the name of the man who had been the ruin of Reginald Lester?"

A low, hoarse cry broke from him, and he staggered back from her, holding out his hand to ward off her blow, while his great frame shook and quivered as if her words stirred him with fear or dread, and his eyes fell before her glance.

Even as her words had effected him, so they moved the girl herself. She shrank back, white and trembling, feeling that now all hope was over. He could not deny the charge; and whatever lingering hope had been in Cecil's heart, it died away for ever.—To be continued.

NEW PUBLICATIONS.

Curiosities of Music. A collection of facts not generally known, regarding the music of ancient and of savage nations. By Louis C. Elson. Published by Oliver Ditson & Co.

Musical history has hitherto been rather a dry field for research, but with this genial guide we suddenly find it full of flowers and pleasant prospects. Like other "curiosities," these stories indicate no little amount of research and hard labor and have been brought together after consulting quite a multitude of books. Hindoo Music, Ancient Egyptian Music, Biblical and Hebrew Music, Music of Ancient Greece, of Rome, of China, of Japan, of Africa, and of Savage Nations generally, are each described somewhat at length, and we are also treated to a very readable account of the music of the Middle Ages, and of the rise and progress of the opera. Mr. Elson chats pleasantly about the kings, or musical stones; the fancied virtues which Confucius and others attributed to tones. It will be seen that this is an appropriate book to be on the shelves of libraries and that it is entertaining to the general reader as well as to musical people.

Sea Air and Sea Bathing. By H. Packard, M D. Price 50 cents. Philadelphia. Published by Presley Blakiston.

The intention of the writer of this one of the Health Primers, has been to explain the beneficial results of sea-air and sea-bathing. Among the many points of interest and instruction are those treating of the time and manner of bathing and also the means of treatment in drowning accidents. The various kinds of baths are also described. To touch upon all the striking features would require an extended notice that would fail to accomplish the benefit imparted by a reading of the book.

Brain-work and Overwork. By Dr. H. C. Wood. Price 50c. Philadelphia. Published by Presley Blakiston.

The subject is treated in so clear a manner that the ideas can be readily grasped by nearly all grades of intellect. It is, of course, particularly adapted to those engaged in brain work, and a careful reading will reveal facts often unknown, and show the necessity of attention to symptoms heretofore unheeded.

Mr. Bodley Abroad. By the Author of "The Bodleys Afoot," "The Bodleys on Wheels," &c. Boston: Published by Houghton, Mifflin & Co.

This, the latest of the Bodley series, holds its reputation with as firm a grasp as any of its predecessors. As a source of instruction and entertainment to the juvenile community it is doubtful if it could be excelled. Children of older growth might also dwell on its pages with no slight interest. Historical facts are treated throughout with much precision, but related in a style to captivate the lover of romance.

Our Homes. By Henry Hartshorne, M. D. Price 50c. Philadelphia: Published by Presley Blakiston.

This one of the American Health Primer Series, is devoted to the consideration of the necessities of healthy homes. The author treats of the following topics: Situation; Construction; Light; Warmth; Ventilation; Water Supply; Drainage; Disinfection; Population; Workingmen's Homes. Under these heads are shown the evils to be guarded against and the laws to be complied with to insure health to the inmates.

BRIC-A-BRAC.

A little girl in the public school the other day had occasion to parse the word "angel," and before deciding as to the gender asked her teacher if "there were any men angels."

A SWARM OF BEES.

B patient, B prayerful, B humble, B mild;
B wise as Solon, B meek as a child;
B studious, B thoughtful, B loving, B kind;
B sure you make matter subservient to mind;
B cautious, B prudent, B trustful, B true,
B temperate in argument, pleasure and wine,
B careful of conduct, of money, of time,
B cheerful, B grateful, B hopeful, B firm,
B peaceful, benevolent, willing to learn;
B courageous, B gentle, B liberal, B just,
B aspiring, B humble, because thou art dust;
B penitent, circumspect, sound in the faith,
B active, devoted, B faithful till death,
B honest, B holy, transparent and pure;
B dependent, B virtuous, and you'll B secure.

She Changed her Mind.—A big good-natured doctor was desperately in love with, and had been twice refused by, a fair-haired little woman. But instead of the disappointment curing his love, it only made the passion grow more intense. After the last refusal, he told her that if ever she changed her mind, to let him know, as his love for her was unchangeable, and he would be proud to be her husband. Some months later he was driving home from seeing a patient, when he saw his lady-love riding in his direction. Supposing she would merely bow and pass on, as she had often done before, he did not pull up his horse. But the moment Miss Dixon came up to him, she reined in her horse, stopped, and called out:

"Won't you stop, Dr. Hill?"

He raised his hat, and replied, "I shall be happy to do so," then waited for her to speak.

She was gazing at the ground and blushing deeply, but, quickly looking up, she filled the doctor's honest heart with surprise and gladness by saying:

"Dr. Hill, I have been closely watching you lately, and seeing nothing but goodness and noble-mindedness in your character, and believing you will make an excellent husband, I am willing to marry you."

A Turkish Joker.—The best known story of the traditional Joe Miller of Turkey is that of his thrice fooling an assembly of true believers out of a sermon, by three successive jocular replies. The first time he ascended the pulpit he said, "Oh, true believers, do you know what I am going to say? They replied, "No;" whereupon he asked, "Of what use is it to preach to such ignoramuses?" and came down from the pulpit. The next time, when he asked the same question, they answered, "Yes, we know;" whereupon, he said, "Then it is useless for me to tell you," and came down. The third time, having taken counsel together, the congregation prepared an answer which they thought would corner their joker-preacher, and said, "Some of us know and some of us don't;" whereupon he promptly replied, "Let those who know tell those who don't, and once more came down.

The worst cut up man of the hour, according to the Cleveland Voice, is that Western reporter who, in describing the appearance of the belle of the town at a local picnic intended to say that she looked au fait, but, of course, the types had to get it "all feet."

"Look here Matilda," said a Galveston lady to the colored cook, "you sleep right close to the chicken house, and you must have heard those thieves stealing the chickens." "Yes, ma'am, I heerd de chickens holler, and heerd de wolces ob de men." "Why didn't you get out then?" "Case, ma'am (bursting into tears), case, ma'am, I knowed my ole fadder was out dar, and I wouldn't hab him know I'se lost confidence in him foah all de chickens in the world. If I had gone out dar and kotched him it would hab broke his ole heart, and he would hab made me tote de chickens home foah him, besides. He done tole me de day before dat he's gwine to pull dem chickens dat night."—Galveston News.

For Women.

CONDUCTED BY MISS RAY CLARK.

REST.

Knitting, busily knitting,
The dear old grandmother sits,
While through the window in sunshine,
The lazy butterfly flits.
It lights on the well-worn Bible,
And sways on its beautiful wings,
While the good old grandmother ponders
And sweetly, but feebly sings.
The hollyhocks, tall and slender,
Stand close by the open door,
Like sentinels, watchful and tender,
Their shadows thrown on the floor.
The blossoms tempt bees by their sweetness,
And blush in the light of the sun.
While birds, in their nests 'mid the tree-tops,
Cease carroling one by one.
And now she has finished the knitting,
And thinking of far-away lands,
She watches the butterfly flitting,
And folded are grandmother's hands.

She dreams she hears little feet coming,
And all her faint pulses are stirred,
For loud o'er the sound of bees humming,
The voices of children are heard.
They troop up the garden path gayly,
And rush through the doorway in glee;
But soon, in demure satisfaction,
Are seated on grandmother's knee,
She tells them the old-time stories
And presses them each to her breast,
Calls them grandmother's dear morning-glories,
And no one knows which she loves best.
Her dreams change slowly to others,
More sad, and yet they are bright,
For three little heads are all shining
Above her, like angels of light;
And six little fair hands are beckoning
And a bright golden gate opens wide,
Where her dear old husband stands waiting,
And gladly she walks by his side.

And, thus sweetly resting, they found her
That day at the setting of sun
With a halo of glory around her,
For grandmother's work was done.

AUTUMN LEAVES.

Autumn leaves in these days are so plentiful that one cannot walk in country lane or village street, or anywhere that the maple grows without the most perfect beauties fluttering at one's feet, as if asking to be picked up and allowed to be useful yet a little longer, by helping to make the home bright and cheerful through the cold Winter days.

Jack Frost does a wonderful work for the Autumn leaves, such rare combinations of colors are seen.

I have just been getting in my Winter stock of leaves and my thoughts run so decidedly to this subject that at the risk of telling my Rural sisters what they already know, I shall tell what I have done and what I intend to do with my leaves. I have long ago ceased to varnish leaves, it gives them a bright look, but I tire of the unnatural shine, besides they curl badly when varnished.

I have tried many ways of preserving leaves, and think waxing the best. I take the leaves as soon as gathered and if damp wipe them with a soft cloth, then lay as many of them as I can upon an old paper and scrape a little wax (common yellow beeswax is as good as any) upon each leaf. I then take a flat-iron just warm enough to melt the wax, a very slight warmth will do it, and any approach to heat will fade the leaf. I am particular that every part of the right side of the leaf shall be covered with the wax. As soon as the wax hardens on the edges I put them to press, and when I am ready to use them I find them looking as bright as the day they were gathered.

Leaves cared for in this way will not curl, and they have a more natural look than any other, while at the same time the color is preserved.

No doubt the maple is the most attractive of the leaves, but I have learned not to allow myself to be so dazzled by its attractiveness that I shall slight the little beach leaf which may be arranged quite as effectively as the maple.

These leaves (of the beach) while they are yet a fresh green are spotted with bright red, yellow and brown and are very beautiful. I have gathered a large quantity this year, and shall arrange them thus; I shall take a long piece of thread wire and fasten leaves to either side of it by short pieces of wire. I can bend it in any shape that I wish and, as the wire is invisible I have a vine which surpasses any wax fixing and almost rivals nature; it can be trailed over white curtains around pictures, or wherever wanted.

Surely there is no excuse for blank unornamented walls when nature has so bountifully furnished material, out of which such a variety of pretty ornaments may be so easily made. August.

HOW TO SWEEP AND DUST.

To sweep and dust a room properly is an art, and like all fine arts has a right method. Well done, it renovates the entire room, and the occupant takes possession feeling that "all things have become new."

It is not merely a performance to be done by the hand, but a work into which taste and judgement—in other words, brains—must enter. Are these closets opening into a room to be swept? Arrange the shelves, drawers or clothing, preparatory to sweeping day, then let this be the first to be swept. Cover the bed with soiled sheets, as also all heavy articles that cannot be removed, first, however, having carefully dusted and brushed them. Remove all the furniture that can easily be set in the hall or adjoining room, having first dusted it; then take a step-ladder, begin to sweep or brush, or wipe the cornice and picture cords and pictures. Draw the shades to the top of the window, or if there are inside blinds, dust them carefully. Open the windows. All the dust left in the room now is in the carpet or air, and the windows will soon settle it.

Now begin to sweep, not toward a door or corner, but from the outer edge of the room toward the center, where the dust will be taken up with a small brush and dust-pan. Go over the room once more; this time with a dampened broom; that removes the bit of dust and gives the carpet a new, bright appearance. Replace the articles of furniture as soon as the air is entirely free from dust, uncover the rest, and the room is new and clean. All this seems an easy thing to do, but there is not one in a hundred who will follow out the detail. Some will sweep the dust into the hall or from one room to another, and then wonder why their house is so dusty again. Others forget cornice and pictures, and thus leave a seed of future annoyance; while a third class will do all but using the damp broom, which is as the finishing touches to a picture.—Farm and Fireside.

THE HYGIENE OF THE FACE AND EYES.

It is a mistake to believe that a good complexion depends upon the use of such and such cosmetics. It really depends upon digestion, which itself depends upon our mode of life. Persons who rise early and go to bed regularly at ten, who take plenty of air and exercise, eat with moderation at regular hours, having their meals at intervals long enough for the digestion of one to be thoroughly accomplished before they begin the next—these persons are sure to digest well, and in consequence have clear, healthy complexions, which will require no other cosmetics but plenty of soft water and good toilet soap.

The hygiene of the eyes is very simple. For them, as well as for the complexion, good digestion is equally necessary; more so, for no cosmetic could attenuate the yellow tinge which biliousness imparts to them; and if some mysterious pencils can supply the insufficient shadow of rare eyelashes, good health alone can give them that brightness which is their principal beauty.

Never read in bed or in a reclining attitude; it provokes a tension of the optic nerve very fatiguing to the eyesight.

Bathe your eyes daily in salt water; not salt enough, though, to cause a smarting sensation. Nothing is more strengthening, and we have known several persons, who, after using this simple tonic for a few weeks, had put aside the spectacles they had used for years, and did not resume them, continuing, of course, the oft-repeated daily use of salt water. Never force your eyesight to read or work in insufficient or too broad light. Reading with the sun upon one's book is mortally injurious to the eyes.

FOR "OLD MAID NO. 2."

I have been a reader of the Rural since January. In the issue of Oct. 2nd, an article over the signature of "Old Maid No. 2," Miss Irene's idea considered, was read with much interest, and I answer the old maid. She states that she has been an old maid nearly thirty years, and never had an offer, and yet she is cheerful and hopeful. I am a bachelor of nearly 24 years, and as such I answer the old maid.

In regard to crabbed men I say that all are not crabbed; as to myself; I am pleasant and always meet the ladies with a smile, and try to do what is right in regard to the ladies' welfare. I have never offered my heart and hand to any lady, but I have a strong desire to do so to some maid, for I am faithful and kind. I think "old maids" really need kind words.

As for Miss Irene, I hope she has found a nice young man she can love by this time. "Old maid No. 2," will find one if she writes to the Rural New-Yorker often, for it is read by many farmers, and they all want a wife to help make tomato cat-sup, &c.

"Old maid No. 2," is probably correct in mistrusting just a little that Miss Irene at this late day (if she had an opportunity) would take a chance rather than wrestle alone with her dear self.

I hope to hear again from "Old maid No. 2." Accept my warmest wishes for the welfare of the old and young maids and the editor of the Rural New-Yorker. I remain your friend, Dr. A. E. S.

ABOUT WOMEN.

Sara Bernhardt has sailed for America. Her arrival is looked forward to, with interest by many, but the productions and not the producer should receive applause.

The Princess of Wales, when at Sandringham, has little tea parties for which she herself makes the butter in a silver churn, and she spreads it on slices of bread which she cuts with her own hands. While she is at her work she wears a chintz dress, and a little white apron.

A young Japanese lady of sixteen, Minet Yuba, daughter of an official in the Emperor's household, has arrived in the East from San Francisco. She is a graduate of the English school in Tokio, and will remain three years in America to perfect her education. She is a poet and a landscape painter, and is described as being extremely polite. She has a light complexion, fascinating black eyes, and a bright, cheerful countenance.

Mrs. Yoakam, of Coos River, Oregon, aided by her daughter and one hired man, carries on her farm, and she has this Summer already laid down 1,600 pounds of butter, for which she expects to realize 50 cents per pound in Winter, and besides sufficient hay for her stock, she has 40 tons to sell.

Fanny Davenport pays $2,400 to Anna Dickinson for her new play, and $50 a night for every performance after it has run three weeks.

Mrs. E. D. Gillespie, who is kindly remembered as the efficient President of the Woman's Branch of the Centennial Management, is writing interesting letters from Switzerland to Andrew's American Queen.

Mrs. Lydia Mountly Roosevelt died at New York, aged 86 years. She was the widow of Nicholas J. Roosevelt, the inventor of the Western

river steamboats, and was the first lady to ascend the Mississippi river in one of them in the year 1810.

MISS THOMPSON, the eccentric Scotch girl who lately shod her horse with gold, has been sent to a British asylum for the insane. She is the daughter of a former civil official in Dumfries, Scotland, and has succeeded in wasting a fortune through her crazy pranks.

MISS LUCY LARCOM writes to the Marblehead Messenger that her poem, "Hannah Binding Shoes," had no real foundation in fact; that she knew many Hannahs in Beverly, but none in Marblehead and that the poem was suggested by the glimpse of a woman sitting at a window binding shoes, which she had on a drive through Swampscott, Marblehead and Salem.

FASHIONS.

Hoops are becoming more and more fashionable; to most dresses is now added a cape and a hood by way of mantle.

A tourist hat is of coarse Leghorn straw, simply trimmed with a torsade of seal-brown satin, and with a brown and crimson plumaged bird laid quite flat across the left side of crown and brim.

The fashionable bracelet is a gold circlet, from which droops one large pearl attached by a small gold ring.

Combinations of brocaded or figured materials with plain ones seem likely to be still very fashionable this Winter. When the whole bodice is not of the figured materials, all the trimmings are—the collar, facings, cuffs and other effective appliances; while upon the skirt the same appears in panels, tabs or simply in bias bands, forming headings to the flounces or other trimmings, which are of the same fabric as the dress.

The new bonnets are mostly of black or colored satin, pleated, not shirred. The shape is a compromise between the Directoire and the Cabriolet; the border open and protruding, lined with satin pleated fanwise, a small curtain behind. The trimming consists mostly of feathers and bows of satin ribbon, put on rather forward upon the crown.

Black velvet bonnets are often lined with pleated dark red or gold-colored satin, and trimmed outside with black feathers and jet ornaments.

Jet is once more extremely fashionable for ornamenting not only bonnets, but mantles and dresses. Sometimes the whole tablier of a dress is beaded with jet; or lappets, basques, revers and facings are covered with jet beads, rendering a black toilet most elegant and stylish.

Velvet is still used extensively for skirts of costumes.

The Directoire is a simple style of cloak, with a plain shoulder-piece and long loose fronts, the back slightly fitted to the waist. It is made of black silk or cashmere, and more or less richly trimmed with passementerie, jet and black lace.

Very pretty indoor jackets are made in the casaquin style, moulding the waist, and coming down low over the hips. A new model for the casaquin or basque waist is the plain square in front, with the back-pieces continued about two inches lower down, and edged with lace or fringe, while all the rest of the outline is finished plain. The sleeves have facings trimmed to match with this back part. The front is trimmed from the neck down to the waist-line with a lace quilling.

The Jersey bodice is much worn of very fine wool, with sleeves of the same wool knitting. A collar and cuffs of embroidered velvet are added to it. It is worn with a short skirt of cashmere, kilted all the way down; a very narrow fluting of silk or satin of some bright contrasting color is added on just under the edge of the kilting. A wide scarf crosses over the skirt, and is tied at the back; it takes the place of a tunic. The mantle which goes with this costume has wide sleeves and a hood. I will describe one such costume, to make my description easier to understand:

Short skirt of navy-blue Hindoo cashmere, with fluting of blue and red Pekin silk round the edge. Wide scarf of wool and silk Pekin of the same color; the blue stripe is wool, and the red stripe is silk. This scarf is thrown across the dress, draped over the hips, and slightly looped up behind, so as to form a light puff. Jersey of navy-blue woolen knitting with velvet collar and cuffs embroidered with red. Vigogne mantle, with a hood lined with Pekin, and sleeves with wide Pekin revers. This costume is most practical.

Silk cord and tassels or cord and knots are much used for dress decoration.

Plush is very fashionable this season. It is used for dresses, cloaks, and hats, amethyst, bronze, myrtle green are the colors most effective. A black ground closely shot with red is one of the latest productions in this material.

Shot fabrics are all the fashion this Autumn, also small cashmere and Madras patterns, the whole combined with self-colored tissues.

A pretty dress is made thus: the skirt-front is composed of alternate flutings of greenish-blue cashmere and plain bands of Turkish cashmere in a medley of colors, commingled so as not to appear gaudy; two flutings and one cashmere band go all round the foot of the skirt. The sides and back of the skirt are covered with a puffed drapery of Turkish cashmere, looped up with bows of greenish-blue satin. The bodice is a long-waisted casaquin, also of the Turkish cashmere, trimmed with a deep turned-down collar, and tapering revers of blue cashmere, edged with Languedoc lace. It is fastened down the middle with small blue and gold buttons. At the back and sides the basque of the casaquin is slit open and turned up with revers of blue cashmere. The sleeves are trimmed with a plain band of the same and flutings of Languedoc lace.

The elegant costume can also be made of any fancy woolen material, with flutings, collar, and revers of satin or surah.

Young ladies have been adopting mantles in the Russian style, in the shape of a long casaque of dark blue serge, lined with silk of the same color. It is trimmed with thirty or forty rows of narrow braid, and has a small pointed hood lined with silk. This dainty hood is the great favorite of the day. It is, as already hinted in former letters, added on to capes, mantles, and even bodices. Small paniers are also worn, and the paniers and hood together give a charming Louis Quinze look to our new Winter costumes.

CORRESPONDENTS' CORNER.

EDITOR RURAL NEW-YORKER:—I have obtained many valuable ideas from your paper, and have several very pretty and useful articles from directions given therein. In your issue of September 18, Art Amateur says she has beautified her windows with "sheets of patented silk paper painted with brilliant oil-colors," and as no such article can be found in the city near us, will she please inform me where it can be obtained, the expense, the precise manner of putting it on, and if it is suitable for large plate-glass in a hall door. By so doing she will oblige a reader of the RURAL.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

I HOPE no mother with a fretful baby will feel as if I had praised my little two-months-old girl at her expense, or considered her complaisant behavior due to my own management; for such is not the case. I regard such effects as altogether the consequence of the health of the parents, combined with regularity in feeding and hours of sleep. The child of a sickly, nervous parent, whether father or mother, is likely to be wakeful and fretful, while the best dispositioned babe can be easily spoiled by irregular hours for dressing, for feeding, and for its daily sleeps. And when very young, as soon as a child has plenty of food, is warm and comfortable, *put it down* in a crib, cradle, or lounge (I prefer the latter), and never rock. If this practice is begun early, the infant soon learns to lie peacefully there, especially if in sight of its mother, leaving her hands free for other work and giving it a needed change of position, more restful than if always in arms. I know all about it, young mother, how tired you feel; of the aching between the shoulders, and the wakeful nights and if the little one is restless *with* regular habits, then set yourself at once to improve your own health by diet and out-door exercise, and so the nervous baby will be strengthened and quieted as its health improves. A mother's will has a strong influence over her tiny charge, and if she uses it aright, even in these early weeks of life, the little darling will yield to her stronger mind, and become accustomed to the hours for sleep she selects for it. But if *she* is nervous and irritable, how *can* it sleep serenely, or how can she expect it to be calm and contented?

DOMESTIC RECIPES.

Angels' Food.

FOUR ounces of flour, after weighing add a heaping tablespoonful of the same material; twelve ounces of powdered sugar; a salt-spoonful of salt; the whites of eleven eggs, flavored before beaten,—rose is generally used—one teaspoonful of cream-of-tartar. Put sugar, flour, salt, and cream-of-tartar together and sift through a fine sieve six times; then stir in lightly the whites of the eggs beaten to a stiff froth. Put into a pan without grease, and bake in a good oven about fifty minutes. This cake must be baked in a NEW PAN, as one kept for any other purpose does not answer as well. When baked turn it over on two or more tumblers until cold; then remove it from the pan, and ice it with thin icing. Soda is not used, and a pan with a tube in the center is preferable for baking.

Imperial Cake.

One pound of butter, one pound of sugar, one pound of flour, one nutmeg, one pound of raisins, half a pound of citron, ten eggs, one wine-glass of brandy, one wine-glass of wine, and one pound of blanched almonds.

Snow Cake or White Sponge Cake.

One tumblerful of flour, one and one-half tumblerful of sugar, one small teaspoonful of cream-of-tartar, (no soda), and the whites of ten eggs. Beat the eggs very light, sift the flour, sugar, and cream-of-tartar together, and stir gradually to the eggs. Bake in a round, papered pan 45 minutes. After baking, frost it with the white of one egg, three spoonfuls of powdered sugar, and then cover with grated cocoanut. MRS. D. SNEDEKER.

Brooklyn, L. I.

Roll Jelly Cake.

Three eggs, one cup of sugar, granulated, four tablespoonfuls of cream, one-half teaspoonful of soda, one cup of flour. If sweet cream is used, add one teaspoonful of cream-of-tartar. Bake in a long, shallow pan to a light brown. When done, turn bottom up on a bowl or cloth, spread with jelly and roll up while warm, wrap the cloth around it and set in a cool place until needed. For sponge cake use the same recipe omitting the cream. It seems to me all the recipes given in our papers are so rich or elaborate in construction as to be of little use to busy housewives whose time is fully occupied. The above will be found quickly and easily made and very palatable.

MRS. C. E. J.

Roll Jelly Cake.

That J. C. C. may have more than one recipe to try for jelly cake that will roll, I send mine which is very simple and so quickly made and baked that it is a favorite with us and many others who have tried it. Three eggs well beaten, one cup of sugar, one and one-half cup of flour, two teaspoonfuls of melted butter (not hot), three teaspoonfuls of sweet milk one teaspoonful of cream-of-tartar, one-half teaspoonful of soda or one of baking powder. I bake in a long bread pan, buttered, having the batter as even as possible. Spread jelly on the top as soon as taken from the oven. Loosen from the sides of the pan if necessary. Begin at one end and roll, slip the knife under and draw a little from the end of the pan and roll a little farther, so it will lie on the end of the cake and keep from unrolling. After a few minutes remove to a platter where it will lie straight. I roll the bottom out, as it will not crack so easily as the top and requires less handling. Should the cake be too thick to suit you, bake next time in a larger pan or in two. This is also a good rule for layer cake in which case you can add more milk and flour. For the jelly I used one orange grated, one cup of sugar and three eggs. Cook 15 minutes, stirring all the while. I took twice the rule for the cake, as I wished a larger one and this amount of filling was sufficient. MRS. E. R. F.

Fig Cake.

Two cups of sugar, one-half cup of sweet milk, one cup of butter, three cups of flour, three teaspoonfuls of baking powder; 24 figs sliced thin. Drop them in after you have put the cake in the tin to bake.

Currant Cake.

One cup of sugar, one-half-cup of butter, one-half cup of sweet milk, three teaspoonfuls of baking powder, one cup of English currants, roll them in flour; one and one-half cup of flour.

Ribbon Cake.

One cup of sugar, one-half cup of butter, one-half cup of sweet milk, one large teaspoonful of baking powder, two cups of flour, three eggs, taking out two of the whites for frosting. Bake in three layers, put spices and fruits in middle layer, between each light one put jelly, then frosting between each.

Marble Cake—(dark).

One cup of brown sugar, one-half cup of molasses, one-half cup of butter, one-fourth cup of milk, yelks of four eggs, two teaspoonfuls of cloves, two of cinnamon, two nutmegs, one teaspoonful of baking powder, two cups of flour.

Light Part.

One cup of white sugar, one-half cup of butter, one-fourth cup of milk, whites of four eggs, one teaspoonful of baking powder, one-half cup of flour, lay in layers or spots. This makes two large layers. MRS. N.

Brooklyn, L. I.

Calf's Heart.

Wash off the blood—do not soak it—stuff with common bread dressing, seasoned with sage and minced onion. Tie a piece of greased paper over the top to keep in the dressing. Put into the oven and bake two hours, basting very often. Put the heart on to a platter, thicken the gravy in the pan, season and pour around it. E.

VARIOUS FORMS OF DRAWN-BUTTER SAUCE.

Pickle Sauce.

Add to the drawn-butter just before serving two or three tablespoonfuls of minced cucumber pickels.

Egg Sauce

is made by adding two or three hard-boiled eggs chopped like dice.

Parsley Sauce.

Mix with the drawn-butter three spoonfuls of minced parsley.

Lemon Sauce.

Chop fine the inside of a lemon, removing seeds, and mix with the sauce.

Oyster Sauce.

Add oysters strained from their liquor and let come just to a boil in the sauce.

A. E. M. B.

Fair skin, rosy cheeks, buoyant spirits and the sweetest breath in Hop Bitters. See notice.

SUBSCRIPTIONS.

I WILL receive subscriptions to the RURAL NEW-YORKER at $2 per year. To induce my old patrons, as well as my new ones, to renew with me, I will, in addition to the premiums already offered to each subscriber by the Publisher, give to each subscriber two pounds silver hulled buckwheat, a new and distinct variety, postpaid by me.

Write address plainly. Forward money by bank draft or P. O. money order on Jamestown, N. Y., except in small amounts, which, if properly folded, usually come safe. Address,

H. A. WHITTEMORE, Fluvanna, N. Y.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

News of the Week.

HOME NEWS.

MONDAY, Oct. 25, 1880.

THERE is no longer any hope of the safety of the Lake steamer Alpena, which must have foundered on Lake Michigan during the gale of the 16th and 17th .....The Presidential election occurs on November 2d, before the next issue of the RURAL will reach its subscribers. The canvas has been one of the most closely-contested for years, and the vote will no doubt be much the largest ever given .. . ...Two cotton sheds, a brick warehouse and two thousand bales of cotton were burned in Charleston, S. C., on the 17th, the loss amounting to $200,000.....On the Shenandoah Valley Railroad, at East Liberty, Page county, Virginia, the entire trestle-work, 1,260 feet long and 94 feet high, went down with a crash in one promiscuous ruin, instantly killing Walter Jones, of Barboursville, Orange county, Va., and seriously injuring Stewart Bocock, of McGaheysville. Rockland county, Va. Loss, $10,000. This accident will probably delay the completion of this section of the road several months.....Dogs got into a herd of sheep belonging to Owen Potts, of Brown's Mills, Burlington county, N. J., and killed 61 of them. Twenty-five others were mutilated and had to be slaughtered .....It is stated at the Interior Department that the Northern Pacific Railroad will be completed within two and a half years.

The forthcoming annual report of the Director of the Mint will show that upon 84 per cent. of the total domestic exports during the last fiscal year the prices realized were about 10 per cent. higher than for the previous year. This increase was on manufactured articles as well as agricultural products, the principal being: Cotton, 25 per cent.; cotton manufactures, 12 per cent.; breadstuffs, 20 per cent, and iron and iron manufactures, 40 per cent.....Mrs. Lydia Maria Child, the well-known authoress, died on the 20th at Wayland, Mass., aged 78.....The Chief of the Bureau of Statistics reports that the total value of the exports of domestic breadstuffs from the United States during the month of September, 1880, were $23,881,936, and during September, 1879, $35,828,848. For the nine months ending September 30, 1880, $208,679,542, and during the same period in 1879, $176,399,946. .....The Indian who murdered the toll collector at Sitka, Alaska, was hanged on the 7th instant. .....Dispatches from North and Northwestern Ontario report a severe snow storm in progress, about four feet of snow having already fallen.... ....A fire at Leadville, Col., on the 16th, destroyed John F. Leninger's book store, Lewis' pawn shop, J. Billing & Co.'s liquor store and Hall's book store Loss, $20,000; insured.

Elfreda Partridge, Carrie Hichborn, Emma Berry and Frederick Patterson were drowned by a boat upsetting in the harbor of Stockton, Me. The bodies of the girls were recovered.....A fire at Sheboygan, Wis. destroyed ten buildings. Loss, $10,000; insured.....Jack Pierce shot and killed Joseph Hornbeck at Rawlins, W. T. Both were teamsters.....A twenty-three-inch strata cave has been discovered, on the line of the Texas-Pacific railroad, west of Palo Pionto, in the canyon of San Antonio.....Mrs. Julia D. Bates, widow of Hon. Edward M. Bates, United States Attorney General under President Lincoln, died at St. Louis on the 16th.....A fire at Wyoming, Stark Co., Ill., destroyed Stone's clothing store, with several smaller places of business. Loss from $40,000 to $50,000; insurance, nominal.....Mrs. Isabella Pidgeon, working as a weaver in the Crescent Mill at Fall River, Mass., has just fallen heir to a fortune of $170,000, left by an uncle who died recently in Australia.....James Lowrey, a carpenter residing at St. Paul, Minn., in a fit of temporary insanity, shot his wife with a revolver, and then blew out his own brains. The woman may recover.....The shipments of bulk grain from St. Louis to foreign ports via New Orleans, from January 1 to October 16 were 13,914,000 bushels, against 6,164,838 bushels for the same time last year.

The report made by Dun, Wiman & Co., at Montreal, of the failures in Canada for the quarter ending September 30, show only 130, with liabilities of $1,319,763, against 417, with liabilities of $6,998,617, for the corresponding quarter last year. .....Seventeen Mormon elders from Utah left for Tennessee, Georgia, Alabama, Mississippi, North Carolina and Virginia, whither they go to make converts to the Mormon faith and secure Mormon emigrants to Colorado.....The Mexican Congress has passed a law by which the Government pays a subvention of $20 monthly to every newspaper published in the republic, the newspapers being required to treat matters of public importance in a manner harmonizing with the necessities and interests of the country..... The body of a little girl named Hassack, whose parents perished by the explosion of the Garden City distillery at Chicago on Friday night, was found among the ruins on Saturday. The bodies of those reported missing have been recovered. The deaths caused by the explosion now number eight.....Governor Murray, of Utah, in his annual report to Secretary Schurz, recommends the substitution of a commission for the Territorial Legislature, in order to get rid of polygamous legislators, and cites Congressional legislation regarding the Northwest Territory and the District of Columbia as precedents.....A boiler exploded at Massilon, Ohio, on the 16th, in Russell & Co.,s paper mill, causing damage to the buildings estimated at $10,000.....A collision on the Cincinnati, Hamilton and Dayton Railroad at Jones' Station, nineteen miles north of Cincinnati, resulted in the injuring of fifteen passengers.

The woman suffrage movement is slowly progressing. In New York and Massachusetts the experiment is being tried in a restricted form in the election of school officers, and a dispatch from San Francisco announces that the Oregon Senate and House have agreed to a constitutional amendment allowing women to vote—the Senate by a vote of 21 to 9 and the House by 32 to 27. Of course this amendment must be ratified by the people in convention or by popular vote before it becomes effective.

A fire at Portage, Wis., destroyed the Pettibone block, in which were located Goodman's clothing establishment, J. E. Wells & Co's hardware and tin store, Loomis Gallet & Breeze's knitting works (employing 50 hands) Bullard's paint shop, the Odd Fellows' Hall, the armory of the Guppy Guards and several other smaller shops. The loss will reach $50,000... ....The Vermont Legislature, in joint assembly, formally declared George F. Edmunds their choice as United States Senator.

Orr, Leonard & Daniels' largeoil mill at Piqua, Ohio, was burned with its ad-joining warehouses both full of flaxseed and oil. The loss is $10,000; one-fourth insured.... The woolen mills, anchor works and other manufactories at Camden, Me., have shut down entirely for want of water. The Megantlcook River was never known to be so low.....A fire broke out in the shoddy manufactory of Benjaman Hey, at Second street and Broadway, in Cincinnati on the 20th in such a way as to cut off escape from the third story, where a number of women were at work. The firemen made heroic but ineffectual attempts to rescue the women. After extinguishing the fire they succeeded in extricating the dead bodies of five women. They were Mrs Doggett aged 40 years; Mrs. Segner, aged 50; Mrs. Jackson, aged 30; Mrs Barrett and Miss Welsh. The loss by the fire is estimated at $25,000; insurance, $12,000.

A most extensive forgery project was nipped in the bud by the arrest of J. B. Doyle at Chicago, on the 21st, and the further arrest of three accomplices in Brooklyn, on the 22d. More than $200,000 of spurious United States bonds were obtained.... ....The Wabash railroad company has secured its objects as the result of the recent railroad war. The company get a connection to Omaha when they build ninety-five miles from Prairieville to Shenandoah, near Council Bluffs, that part of the road to be operated jointly by them and the Chicago, Burlington and Quincy. The company also get entrance to Chicago and its part of all pool arrangements.....The rain of the 20th-23d has put an end to the protracted drought in the Eastern States.....A gravel train on the Chicago, Milwaukee and St. Paul railroad ran into a drove of cows, near Stillman Valley, Ill., ditching ten cars and killing several persons. John Ryan, a section man, was killed outright. The killed and wounded numbered fourteen. Three of the train hands are reported killed. Many of the wounded were boys living in the neighborhood, who were having sport on the train while it was switching. .....John Reed had his head caught in the machinery of the Fishback rolling mill at Pottsville, Pa., and was fatally injured.....The New York Central railroad, it is said, gives direct employment to over 12,000 persons.....The New Orleans Picayune hears that the Cunard steamship company will put on a line of vessels between that port and Liverpool.

The manufacture of barbed wire fencing has increased from 10,000 pounds in 1874 to 27,337,000 pounds in 1879, and it is estimated this year's production will reach 50,000,000 pounds.....Captain Eads assures New Orleans shippers that a few hours' dredging in one place in the jetties channel will enable the Great Eastern to come up to New Orleans drawing 29 feet.....A new method of tanning hides, not by any form of tannin but by chrome, is being tried in Scotland. It is said to be cheaper, quicker, and to make better leather than the old ways.....The Saginaw Valley lumber shipments thus far this season are the largest in the history of the trade of Michigan. The shipments of lumber from the port of Bay City for the month of September are 7,882,921 feet. The lumber shipments from the Saginaw River from the beginning of the season to October 1 are 824,025,286 feet, an increase of 135,392,343 feet over the same period of last year.....The Toledo, Peoria and Warsaw and the Missouri, Iowa and Nebraska Railroads have ceased to exist as independent corporations, and will hereafter be known as the Peoria and Iowa Division of the Wabash, St. Louis and Pacific Railway Company.....Superintendent Walker, of the Census Bureau, will make a complete report of the enumeration of population to Congress at its next session. A report to Congress in the session next following the enumeration has never before been made.

FOREIGN.

THE Post Office at Manchester, England, was burnt yesterday, it is supposed by Fenian incendaries, and at the same time telegraphic communication with London was cut off. Two regiments of infantry have been ordered to the town. Manchester has a very large Irish population, and was the scene of a very fatal explosion in the Fenian outbreak of '67.....The British government has decided to prosecute the leaders of the Land League for conspiracy to resist the laws. About 200 indictments are being prepared against Parnell and other members of Parliament who are prominent agitators in the movement, as well as against journalists and public speakers, all of whom will, it is expected, be arrested towards the end of this week. It is reported that in despair of securing a verdict against the accused in Ireland, a change of venue to England will be sought by the government from the Court of Queen's Benoh. This is the first time such a step has ever been tried, and great doubts exist as to its legality. The Irish policy of the Gladstone Ministry is bitterly opposed by all parties; but the Ministry says it will stand or fall by that policy. A large number of outrages against property have occurred during the week in Ireland. The tenants of Mr. King-Hartman, a very large land owner and an ex-M.P., have been warned if they pay rent they will be shot. Excitement at fever heat. Large numbers of arms are being sold from this country. More troops are being sent to the island.....The city of Oxford will probably be disenfanchised for a term on account of gross frauds in the election of its member of Parliament at the last general election.....Harry Beckett, the well-known actor, died in London last Saturday.....Archbishop McCabe of Dublin will soon be made a cardinal. He has written a strong pastoral letter against the programme of the Land League, which will henceforth be opposed by most—not all—of the Catholic clergy. The letter has excited the fierce resentment of most of the leaguers.

The speech of the King of Greece on opening the legislature on Thursday is regarded as a declaration of war against Turkey. Greece has under arms nearly 40,000 men ready to invade the Turkish territory which she claims. Inasmuch as Turkey could easily crush her if unaided, the plucky little kingdom would not begin war unless pretty certain of foreign aid. The government has notified England that, having failed to receive aid from the European Powers, she will occupy Thessaly alone. Notwithstanding the continued refusal of France and Germany to join with Great Britain in pressing for the immediate satisfaction of Greece's claim upon the Sultan, Mr. Gladstone will insist single-handed in the name of England upon the full surrender of the disputed territory, an action which, it is seen, points directly to a general European war.....Much excitement in Albania on the death of several prominent chiefs who were opposed to the cession of Dulcigno. Suspicion of poison.....Riza Pasha, the Turkish commander, has taken measures to disarm the most turbulent of the Albanians in and near Dulcigno, and the Porte peremptorily ordered him yesterday to surrender the place unconditionally to Montenegro within five days. After the surrender Montenegro will liberate all imprisoned Mussulmen and proclaim an amnesty.

In France the expulsion of the religious orders is causing great excitement. In several instances all the police commissioners of a town have resigned rather than execute the decrees against them; a very large number of magistrates have done the same for the same reason, and others have been publicly excommunicated for enforcing the decrees. In spite of numerous rumors that the government was "weakening" in the matter, the latest cablegram says it has been finally decided to persist in the persecution....In a late trial it came out that Gen. Cissy, while Minister of War some years back, was very intimate with a lady who was separated from her husband, and who is now accused of having been a Prussian spy. Through her, it is alleged, the German Government obtained all the secrets of the French War Department. When the matter became public the other day Cissy was promptly removed from the military command of one of the departments which he held at the time. This measure has caused great excitement among the Republicans with whom the general is a favorite, and they with him demand a trial and conviction before punishment.

It has lately been made public that shortly after the death of his wife the Izar married morganatically the Princess Dolgorouki, with whom he had several children during the tzarina's life-time. The tzarewitch, his eldest son and heir to the throne, together with his other children, being opposed to the marriage, left St. Petersburgh at the time in order not to be present at it. His health has been very poor of late, and he has retired with his wife to Livadia, his winter residence, and it is reported that he is desirous of transferring the reins of government to the tzarewitch, he himself retaining the "imperial privileges," and remaining permanently in his present quarters, provided his children by his present wife, born during the lifetime of the last, are legitimatized and acknowledged to be princes and princesses ranking after his children by the tzarina. The tzarewitch has gone to Livadia and will probably consent..... The Nihilists, after all, are not exterminated but only resting, or perhaps secretly undermining the present order of things. The Representative of Hamburg will shortly ask to have the city proclaimed in a state of siege on account of the Nihilists. Prussia will make a similar proposal in regard to Altona, Ottensen and Wendsbeck.

The Canadain syndicate that is trying to raise money in England to build the Canadian Pacific Railroad, report very favorable prospects..... Several severe shocks of earthquake were felt at Dijon, France Wednesday. An earthquake occurred at Lisbon, which was felt in almost every part of the country. No damage is reported. An earthquake occured in several towns of the province of Zamora, Spain. The shock was also felt at Madrid.

Forty days having elapsed since the birth of the Infanta Mercedes, imposing ceremonies took place in the palace at Madrid, Spain, Thursday, on the occasion of the first appearance in public of Queen Christine. The papal brief was read, and gifts from the Pope to the queen and infanta were presented.....The arrest of Warschafsky, a well-known capitalist and purveyor to the Russian army, is in connection with the army supply contract of the last war. It is stated that evidence is forthcoming that Warschafsky defrauded the authorities out of 22,000,000 roubles. Boren, secretary of chief of the army, and chief administrator during the late war, has also been arrested at Odessa.

A dispatch from Buenos Ayres, by way of Lisbon, received at London on Monday, says: "A terrific snow-storm occurred in this province on the 18th of September, and it is estimated that 700,000 cattle, 500,000 sheep, and 250,000 horses perished. .....There are contradictory reports about the war between Chili and Peru and Bolivia. The latest is that the belligerents have agreed to abide by the arbitration of the President of the United States in the present difficulty, and they are to invite all the different States on this continent to agree to the establishment of a system of arbitration for the settlement of all future questions among themselves.

[Saginaw Daily News.]

Mr. George Schick informed our reporter that he had been suffering with rheumatism in his feet so badly that for weeks at a time he would be unable to leave his bed. He tried various remedies without relief, and concluded to use St. Jacob's Oil. It acted like magic. In two days he was entirely cured.

AGRICULTURAL NEWS.

Generally speaking the French farmer is not a jolly soul. Whether he be a man of education or not, he settles down into a grub sort of life, faring frugally on soup and the thinnest of ordinary red wine or cider. The stock of his soup is bacon, and he eats butchers' meat only twice a week, that is, on Sunday and market day. When he attends market he makes a succulent dejeuner and drinks a good deal of beer afterward at the cafe. This is his only cheerful time.....Epizooty has become epidemic in nearly every town in Southern New Jersey. In Ocean and Monmouth Counties, especially in the towns skirting the coast, the malady is as violent as it was in its visit in 1876. Several deaths are reported. In Burlington County hundreds of horses are affected, but the disease there is of a mild type. The horses in the furnace towns are suffering the most. Wild onions are being used as a cure for the disease by the farmers with much success It has also extended westward some distance beyond Chicago and is still traveling steadily. In some places it is quite as severe as on the former visit; but generally it is of a milder type, seldom proving fatal.....The exports from New York of wheat and corn on last Friday week were larger than for any previous day in the history of this port. Of wheat there were exported 720,206 bushels, and of corn 420,022, a total of 1,140,228. This is largely due to shippers who, having made contracts, hastened recently to cover them for fear that prices would advance later in the month. The Mark Lane Express, of the 18th, in a review of the grain trade for the past week, says: "The weather has been very favorable for the wheat sowing, and, as the farmers will be fully occupied therewith, thrashing will be restricted during the present month. In English wheat, the proportion of first-class samples in good condition has been exceedingly small. The demand for good qualities has been active, and at the more important of the provincial markets they advanced 1@2s. per quarter. In foreigns, wheat has been subject to reaction and uncertainty during the week, but at the close it was firm, and the decline was fully recovered..... Under date of October 6th, it is stated that the French farmers were occupied with field work and were bringing very little wheat to the markets, in consequence of which it was higher, with a more active sale.....The exports from Atlantic ports from July 1 to Oct., 16, 1880, have been 2,213,863 bbls of flour and 59,647,418 bushels of wheat, equal to 69,609 802 bushels of wheat. The movement of wheat at Western lake and river ports has been quite moderately increased for the week ended Oct, 16, as compared with the previous week, but still it is not nearly so large as it was for the corresponding week in 1879. The movement of wheat at San Francisco from July 1 to Oct 4, 1880, has been only about one-half as much as it was for the corresponding period in 1879. The exports from July 1 to Oct 4, 1880, have been 3,099,842 bushels against 6,182,100 bushels for the corresponding period in 1879. The exports from Oregon from July 1 to Oct 1, have been 48,880 bushels of wheat.

The cotton crop of the United States for the year ending September 1st, is estimated at 5,757,397 bales, the largest probably ever raised, and worth $200,000,000. For 1878-9, the crop was 5,037,531 bales. This year's crop, not yet picked, is expected to be still larger than that of 1879-80. .....Several of Kankakee's, Ill., leading men have formed a joint stock company for the manufacture of glucose and grape sugar. The capacity of the factory will be, for the present, 1,000 bushels of corn per day.....Among the exports from this port on Saturday, were 50 tons of fresh meat for Liverpool and 1,200 quarters for London, together with 50 head of prime cattle and 250 dead sheep. The export of apples still continues very heavy.....The visible supply of wheat Oct. 16, was 15,764,158 bushels, vs. 14,422,158 bushels October 9, 1880; 23,205,349 bushels October 18, 1879, and 16,503,659 bushels October 19, 1878. The stock here in store October 16, 1880, was 1,171,893 bushels, vs. 1,934,748 bushels October 9, 1880; 3,734,878 bushels October 18, 1879, and 620,419 bushels October 19, 1878.....The deliveries at Seaboard ports for the week ending October 22, were 3,540,719 bushels vs. 3,106,362 bushels the previous week, and 5,622,461 bushels the corresponding week in '79. The export clearances from thence for Europe for the week, were 3,666,524 bushels vs. 3,589,626 bushels the previous week, and for the last eight weeks, 29,843,461 bushels vs. 40,321,174 bushels the corresponding eight week in '79. The receipts here for the week were 1,741,842 bushels vs. 1,126,426 bushels the previous week. The sales for the week were 6,575,000 bushels vs. 9,214,000 bushels for the previous week. The stock at Atlantic seaports, October 6, 1880, was 3,231,935 bushels, vs. 7,512,333 bushels October 18, 1879.....The visible supply of corn October 16, 1880, was 20,262,111 bushels vs. 19,934,220 bushels October 9, 1880; 10,562,315 bushels October 1879, and 10,439,577 bushels October 19, 1878.

The outlook in Russia is very gloomy as regards food for the coming Winter. The average export of wheat is about 40,000 bushels, although it was much more last year owing to the high price and a bountiful harvest. This year there will be no export of wheat, and it is pretty certain there will be a considerable import. Everywhere the harvest was short, and in many places almost an entire failure; nor is there much prospect at present that the country will soon be able to have large crops again. Insect pests abound and leave little hope of fine harvests; drunkness among the peasantry is even more injurious than their antiquated system of husbandry, while the numerous holidays

of the Russian Church keep them idle nearly one-third of the time.

Nearly all the horses at the national capital are down with the epizootic. In the middle of last week the disease commenced to spread. In the surrounding country, Maryland especially, farm-horses have the affection, and in some instances farmers are put to much inconvenience, as well as the city railway company at Washington..... Commissioner LeDuc is manufacturing sorghum in his mill in the rear of the Agricultural Department at the rate of several thousand pounds a day.

The treasurer of the Maine Beet Sugar Company asserts that last year the company worked 9,000 tons of beets into 900 tons of sugar and molasses, which sold for over $110,000 dollars, and gave a moderate profit over and above the State bounty. .....The Colorado Live Stock Insurance Company was recently organized in Denver. It proposes to insure horses, cattle and mules against death.....It has been found that the cotton stalk, its branches, and the cotton bolls that are left by the cotton pickers, contain a fiber which, when properly prepared, is equal to the finest manilla for the manufacture of cordage and the like. Planters are recommended to bundle and stack the stalks after cotton picking is over. This discovery will add very materially to the value of the cotton crop, once the market for stalks has been established.....A syndicate of cattle dealers of Toronto has contracted with the Allan and Dominion lines of steamships for space for 20,000 head of cattle for the ports of Liverpool, London, Bristol and Glasgow.... Texas cattle men are more than satisfied with the season's business, as their stock brought one dollar a hundred more than was expected. The drive for the season aggregates over 300,000 head, 125,000 of which were taken to Nebraska, and the rest stopped South, mostly on the Kansas line.....A leading Liverpool Grain Circular of last Friday says:—"The Wheat trade during the past week has been much quieter, millers only operating sparingly, and previous prices were not generally obtainable. Cargoes in all positions, in consequence of easier offers from America, were dull and lower. At Liverpool since Tuesday the business in wheat has been merely retail, at rather under Tuesday's prices. Corn, in consequence of recent large arrivals, has been somewhat cheaper. The attendance at to-day's market was about average. Wheat sold slowly, Michigan and red winter declining 1d. to 2d. Flour was quiet, but prices were maintained in consequence of limited stock. Corn was less actively inquired for and gave way slightly."..... ....The week's circular of the Liverpool Cotton Brokers' Association of above date says:—"Cotton has been in increasing demand throughout the week, and quotations for all descriptions have advanced. American was in condiderable demand, which was freely met. The quotations for Orleans, middling uplands, and Mobile, are unchanged. Ordinary advanced ½d. and all other grades 1-16d In Sea Island a fair business was done. Quotations for Island cotton are easier. Futures during the first two days were dull. On Monday and Tuesday they became active and advanced 3-32d. @5.32d. Since then the market has been quieter and closed easier. The final rates show an advance of ½d. for October and 1-16d. for other positions.

ERRATUM.—The Price of the Hoosier Corn Drill is $20 instead of $15, as stated in our Premium List and Fair Number.

He Still Lives.

Some years ago Dr. R. V. Pierce, of the World's Dispensary and Invalids' Hotel, of Buffalo, N. Y., and London, was sent for to examine a terrible disease of the knee joint, resulting in ulceration and extensive sloughing of the bone and tissues. The man's life had been despaired of by the previous attendants. Amputation at the the thigh was promptly decided upon and skillfully performed by Dr. Pierce, and as after treatment to purify the blood and prevent a recurrence of the malady the Doctor's Golden Medical Discovery was freely prescribed. The man's system was thoroughly purified and strengthened, he rapidly gained his health, the stump healing nicely, and he is to-day a happy man. This case was among the first in which this wonderful blood-purifier was tested. It has since manifested its wonderful power over the worst scrofulous and other blood diseases. Taken for a time it so purifies and strengthens the system as to strongly fortify it against the encroachments of diseases. Sold by druggists.

MIDDLEVILLE, Mich., Feb. 15th, 1879.
Hon. R. V. PIERCE:

Dear Sir—I would say that I have sold your medicines for seven years. The Golden Medical Discovery is the best cough remedy I have ever used, and in every case where I have recommended it, it has cured. I have used it in my family for my children. It cures their colds and coughs in a day or two. My wife has used it several times when down sick. It invariably gives immediate relief. Its sale increases daily. J. B. KESTER, Druggist.

"I'm All Played Out,"

is a common complaint. If you feel so, get a box or bottle of Kidney-Wort and take it and you will at once feel its tonic power. It renews the healthy action of the kidneys, bowels and liver, and restores natural life and strength to the weary body. —Times.

Let the poor sufferers from female complaints take courage and rejoice that a painless remedy has been found. We refer to LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It is prepared at 233 Western Avenue, Lynn, Mass. Send to Mrs. Pinkham for pamphlets. Sold by druggists.

TROPIC-FRUIT LAXITIVE removes Habitual Costiveness and all kindred complaints, It is composed entirely of concentrated fruits and medicines. Druggists sell it.

Sour stomach, sick headache and dizziness, Hop Bitters cures with a few doses.

Burnett's Flavoring Extracts are used and endorsed by the best Hotels, Confectioners, and Grocers throughout the country. They are perfectly pure, and of great strength—at once the cheapest and best; and received the highest award at the Centennial Exhibition.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 23, 1880.

BEANS AND PEAS.—The old stock of beans and those now included in the receipts are of under grade quality, and new crop, which are fairly plenty, lead the demand. Sales for local use are improving. Shippers, whose chief wants are marrows and white kidneys, seem to be holding off until the offering contains larger and assured cured lines. Red kidneys are cultivated to an extent that puts them into an ordinary price list. Black beans will not move freely until the weather settles cold. Green peas quiet. Prices unchanged, but it is thought that trade will revive when qualities are more reliable. Southern B E. peas dull.

BEESWAX.—Demand is light and and prices lower; quoted at 23½@24 for Western and Southern.

BUTTER.—Outside of choice creamery and fine ends of State and Western the market is quiet. Sellers attribute the lull to politics, buyers to stringent prices, and both parties make a good shot at the situation. It is not likely that much animation will develop until the election is over, and then it is to be hoped that some of the weighty dairies can be moved. Receipts are moderate but dealers cannot make a favorable price argument of the fact, as it is known that there is plenty of stock to be marketed and the season is young. Oleo is the great antagonist of lower priced table stock, especially for eastern use. The weather has been very favorable for the production of substitutes and even running quality is a great attraction to retailers who do not have to cater to a fastidious line of consumers. Exporters are bidding about last prices; sales for Europe small.

Creamery, fine State and Western, 30@31c.; good to prime, 27@30c.; poor to fair, 23@25c.; sweet cream, 24@28c.; State entire dairies, choice, 24@27c.; other, 23@25c.; firkins, fair to choice, 21@25c.; State pails and half tubs, fine fresh, 28c.; good to prime, 26@27c.; fair to good, 24@26c.; poor, 21@22c.; Welsh tubs, fine fresh, 26@27c; poor to good, 20@23c.; Western imitation creamery, 20@24c; do-dairy, fresh, 23@24c.; poor to good, 16@21c.; factory, June, 17@19c.; current make, 19@21c; poor to good, 15@18c.

Receipts for week, 23,725 pkgs.; exports do., 8,825 pkgs.

COTTON.—There is a fair degree of activity and a steady market at the close for

October at 10.82@10.84c.; November at 10.85c.; December at 10.94@10.95c.; January at 11.09@11.09c.; February at 11.23@11.24c.; March at 11.39@11.40c.; April at 11.54@11.55c.; May, 11.70@11.71c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Receipts for week, 33 250 bales. Exports do., 14,250 bales.

CHEESE.—The arrivals have been somewhat larger, the bulk arriving late from central New York. Some accumulation of stock has occurred the market leaving off rather easy; quotations are for

State factory, fancy, at 13@13¼c.; do. good and prime, 12½@12¾c.; do. fair to good, at 11¾@12¼c.; do. h'f skimmed, 10@11c.; Wisconsin factory, fine, 12½@12¾c.; do. good to prime, 12@12½c.; do. fair to good, 10¾@12c.; Ohio factory, fine, 12¾@12¾c.; do. good to prime, 11½@12c.; do. flat, fair to good, 10¾@11½c.; do. poor to fair, 7@10c.

Receipts for week, 67,130 boxes.
Exports for the week, 45,330 boxes.
Liverpool cable, 66s. 6d.
Steam to Gt. Britain, 40@45s.

DRIED FRUITS.—Apples made out moderately, without change in prices. Peaches are steady and in moderate demand. Small fruits are quiet. Quotations for

Apples 8@8¼c., for evaporated prime, and 7@7½c., for ₱ lb do with Carolina sliced at 5@5¾c. for good to prime; Virginia and Tennessee 3¾@4¼c. Peaches at 28@29c. for evaporated peeled; 14c. for unpeeled do; peeled peaches at 16@20c.; unpeeled do. 6½c. for halves. Blackberries at 7½c Cherries at 18c. Raspberries at 25@26c.

Exports for week, 5,363 bbls. of dried apples.

FRESH FRUITS.—Exports of apples for week 34,871 bbls. Prices are steady for prime good keeping showy apples; last week rates named with confidence as receipts have been lighter for the week. New Jersey apples have no valuable place.

Western N. Y. mixed, $1.12@1.37; Fall pippins $1.25 @1.50; Baldwins in shipping order, $1 25@1.50; Greenings, $1@1.25. Seitzenbergs fine this year, $1.25@1.50; Kings, $1.25@1 50; 20-oz., $1@1 50, N. J. open heads, 50@75c. Cranberries rather more active at last figures. Cape Cod, bbls. fancy, $5.00@5.75; poor to choice, $3@5.25; boxes, $1.75@2; N. J., do. $1@1.50. Quinces slow of sale and lower; $1.50@3. Pears scarce; fancy Boston boxes choice $4@6; fair to good $1.50@3; Duchess, in bbls. $5@7; Lawrence, $1@5; Beurre d'Anjou, $5@7; Vicars, $3@5. Grapes are quiet since prices stiffened. Catawbas cases of 18 3-lb. $2.75@3, baskets 5@6c.; Concords cases $2.50@2.75; bulk and baskets 4½@5½c.; Isabella 2½@4c.; chestnuts, bush. of 60 lbs. $1.75@2 25. Hickory nuts, new, per bush. of 50 lbs. $2.25@2 50. Peanuts dull; new quoted under old; Va. hand-picked per lb. 5c.; extra prime, 4@4½c.; good to prime, 3½@4c.; shelled, 5½@5¾c. The entire crop is estimated at 2,220,000 bushels.

FLOUR.—The offerings are liberal and prices easy, giving an active trade.

Latest prices are: $3.60@4.25 for very inferior to very fancy superfine State and Western; $4.25@4 50 for poor to choice extra State and Western, odd lots and lines; $4 50@4.70 for choice to fancy do.; very inferior to good white wheat, trade and family extras, $4 85 @5.65; good to choice do. at $5.65@6.25; (very choice to very fancy do. at $6.35@6.65;) red and amber winter wheat inferior to choice trade and family, at $4.70@6.25; round hoop Ohio, $4.65@5.15; and trade and family brands of do. at $5.25@6 35; St. Louis at $4.90@5.85 for inferior to good extra, $5 85@6.35 for good to choice (and $6.35@6.75 for choice to very fancy brands); Minnesota clear, inferior to fancy at $4 20@6.10; Minnesota "straight," poor to fancy, at $5 75@7.15, and patent inferior to very fancy at $5.75 @8.75; unsound stock at from $2 50@5.00; city mill extra at $5.40@5.85 for ordinary to fancy for the West Indies; do. for England, $4 25@6.65 for poor to choice spring wheat, and $4.85@5.40 for winter wheat product; do. trade and family extras, $5.60@7.00 do. for South America, $5.70@6.00.; No. 2 at $2.75@3.75 for very poor to very fancy.

November at 38¾@38¾c.; do., December at 39¾@39¾c.; No. 3 at 36¾c.; ungraded white Western at 38@45c.; ungraded mixed Western at 35@38¾c.

HAY AND STRAW.—Demand is good and prices well sustained.

Shipping hay is at 85c.; medium to prime do., 95c.@$1.20; salt hay at 60@65c.; clover do. at 65@75c. Straw at $1@1 05 for long rye; 70@75c. for short rye; and 65@75c. for oat.

Exports for the week, 1,300 bales.

HOPS.—There is a limited amount of business and as supplies steadily accumulate prices are unsettled and lower. Quotations are for

	Cents per ₱.
New Yorks, crop 1880, prime and choice	20 @23
Do. medium	18 @20
New Yorks, crop 1880, low to fair	16 @17
Eastern, crop 1880	16 @20
Wisconsin, crop 1880	16 @20
Yearlings, crop 1879, choice	16 @23
Olds, all growths	4 @12
Bavarians	30 @35

HONEY—Trade is still of a retail style and full quotations would not be urged for round parcels as receipts are oppressive.

White clover comb, single pkgs. 17@18c.; larger pkgs 15@16c.; buckwheat 12@13c.; extracted, dark to white, 8@12c. Extracted is pushing strained aside when purity is guaranteed.

LEATHER—Quotations are for hemlock sole, 22@ 23½c. for light; 23½@25c. for middle; 24@26c. for heavy, and 21@22½c. for good damaged.

OIL CAKE.—Western is quoted $32 per ton.

PROVISIONS.—Hog products have tended lower on diminished demand Latest prices are for

Mess on the spot for export $16; do. for delivery on October contract, $18 bid. Bacon at 8c. for long clear. Beef for extra India mess at $18.50@19 for city; $9.50@10 for extra mess and $9 for plain mess; $11@11.75 for packet, and $13@13.25 for family mess. Beef hams at $16. Lard—Western steam at 8.37½c. for spot lots; 8.37½c. for Oct.; 8.37½ for Nov.; 8 2½c. for Dec.

Receipts for week, beef, bbls. and tcs.; 5,102; pork, 2,650 bbls.; cut meats, 25,820 pkgs.; lard, 22,639 pkgs.

Exports for week, beef, bbls. and tcs. 1,606; pork, 3,400 bbls.; cutmeats, 5,313,369 lbs.; lard, 5,666,850 lbs.

SEED.—Clover is firm at 8¼@9c. for prime and choice lots. Timothy is quiet at $2.70@2.80, Flaxseed quoted at $1.40.

Receipts for week, 708 bushels.
Exports for week, none.

POULTRY AND GAME.—A good many straw-packed parcels have turned out good, but remote points, if they ship at all, should use ice. The better way now is to await advices. Demand fair; prices good.

Turkeys, State and Western, choice, 13@14c., ₱ lb.; fair to good, 11@12c. Philia., dry-picked 14@16c. Chickens, do., 15@17c.; Bucks Co. do 14@15c.; State scalded, 13@14c.; Western, scalded, 12@13c. WOOL—Demand has been rather better and the market somewhat steadier without absolute change in prices. XX Ohio, Penn, and Va. fleeces quoted 45@47c.; X, do. at 44@45c.; No. 1 at 47@49c.; No. 2 at 42@44c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Oct. 23, 1880.

BEEVES.—Receipts for the week 13 440 head; do. last week, 13,3.4. The market has been slow and dragging all the week. On each market day the supplies have exceeded the wants of trade though sellers offered liberal concessions. Prime native and Texans held Wednesdays prices in the sales that occurred, but common and medium stock fell off a strong ½c. Texas quoted 7@7¼c. to dress 55 lbs; poor to fair native steers 7¼@8¼c. to dress 54 @56 lbs.; good to prime 9@9¾c. to dress 56; choice 10@ 10½c. to dress 58@57 lbs.

COWS AND CALVES.—Prices rule about as before; $25@3 per head for common; $35@40, fair to good; $55@60, prime to choice. Receipts small as good milk-yielders are worth quite as much at home. Such regular trade as exists is in few hands and of late years car load lots and frequently good singles depend upon a chance customer.

VEAL CALVES.—Fine veal dead or alive has sold rapidly; common and heavy grades have ruled dull. Live calves, N. J., fed, 7½c., State 7@7½c.; fair to good, 6½@7c.; poor, 5½@6c.; Mt Holly, heavy, 4@6c.; light, 6½@7½c.; buttermilk, 3@4c.; grassers, 2½@2½c.; dressed choice fed, 10½@11c.; fair to prime 8@10c.; common 4@7c.

SHEEP AND LAMBS.—Receipts for week, 37,223 head; do last week, 37 414 do. Trade has been light in sheep but prices hold as the weather will increase the demand. General sales, 4@5c. ₱ D., with a few fine Kentuckys at 5½c. wethers.

SWINE.—Receipts for the week, 41,183 head; do, last week, 32,94i do. Market weak. Many State and N. J. hogs are too fat for the season. Live hogs, $4.87@ 5.10 per 100 lbs. corn fed; dressed N. J. heavy pigs, 6¾@6¾c. per lb.; light, 7¼@8c.; city dressed State, 6 @8c.; do. Western, 6@6¾c.; pork tenderloins, 12c. in boxes.

Reading for the Young.

AUTUMN IS HERE.

WHAT visionary tints the year puts on,
When falling leaves falter through motionless air
And nimbly cling and shiver to be gone!
How shimmer the low flats and pastures bare,
As with her nectar Hebe Autumn fills
The bowl between me and those distant hills,
And smiles and shakes abroad her misty, tremulous hair.

Far distant sounds the hidden chickadee
Close by my side; far distant sounds the leaves;
The fields seem fields of dream, where Memory
Wanders like gleaning Ruth; and as the sheaves
Of wheat and barley wavered in the eye
Of Boaz as the maiden's glow went by,
So tremble and seem remote all things the sense receives.

The sober robin, hunger-silent now,
Seeks cedar-berries blue, his Autumn cheer;
The squirrel, on his shingly shagbark's bough,
Now saws, now lists with downward eye and ear,
Then drops his nut, and, with a chipping bound
Whisks to his winding fastness underground;
The clouds, like swans, drift down the streaming atmosphere.

The red oak, softer grained, yields all for lost,
And, with his crumpled foliage stiff and dry,
After the first betrayal of the frost,
Rebuffs the kiss of the relenting sky;
The chestnuts, lavish of their long hid gold,
To the faint Summer, beggard now and old,
Pour back the sunshine hoarded 'neath her favoring eye.

O'er yon bare knoll the pointed cedar shadows
Drowse on the crisp, gray moss; the plowman's call
Creeps faint as smoke from black, fresh-furrowed meadows.
The single crow a single caw lets fall;
And all around me every bush and tree
Says, Autumn's here, and Winter soon will be,
Who snows his soft, white sleep and silence over all.

FARMING FOR BOYS AND GIRLS.—NO. 1.

HENRY STEWART.

The Value and Pleasure of Agriculture.

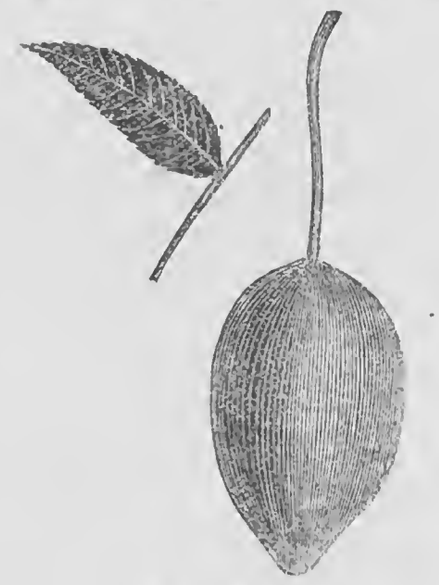
THE chief desire of a man or a woman should be, first, to be useful; and next to be happy. A man's first duty is to mankind; and the next is to himself; and the greatest happiness to a good man is to be of use to, and serve his fellow creatures. In doing this the man helps himself at the same time. The production of food and the materials for clothing, is the business of the farmer. No other employment can be so useful as this; and in this lies the value of agriculture to the world. No other employment is so full of pleasure as agriculture, when it is rightly pursued. It is then, not a laborious work merely of the hands, but a healthful, pleasant labor; full of the most agreeable enjoyment; because in the work of the garden and the field, the farmer is brought face to face with the works and the beauties of nature; and finds, in the sprouting of seed, the growth of plants; the maturity and ripening of vegetation; the growth of his animals; the delights of the changing seasons, which bring to him a ceaseless round of work that is both interesting and profitable; in all these, he finds food for thought and means for instruction. In short, a good and successful farmer, in his daily practice, becomes acquainted with many of the wonders of science which appear to him more clearly than to any other man, if he will only take the trouble to open his eyes, and turn his mind to the examination of them. It is a great thing to think of, that the farmer feeds and clothes the world; that of all men he is the most important to the comfort, wealth and happiness of the human race; that his influence, if it is exerted for good, increases the enjoyment of mankind, and that the result of his work is to set in motion the wheels of all the factories and locomotives in the world; to fill the freight cars; to load the ships; to give employment in one way or another to every smith and carpenter; to every miner; to every lawyer and doctor; to provide in fact for the means of carrying on every honorable and profitable industry. No youth or young man or woman can find a better, happier, more noble, or when well conducted, more profitable work than that of the farm. It is work; there is no doubt of that. But the man who is employed honestly is the truly happy man. It is the idle and vicious who are unhappy. We are told by the wisest of men, that "the sleep of the laboring man is sweet;" and no one sleeps and rests more sweetly than the boy or the man who has spent his day in the corn field, the hay field or at the plow; or the girl who has done her share in the dairy, in the care of poultry, and in her household duties. How all this work may be performed in the best manner, and how the most profit and enjoyment may be derived from it, will be explained in the succeeding chapters.

NUT-BEARING TREES—No. 2.

Ripening hang the nuts
Upon the laden boughs; the clusters brown
Of russet hazels; the spiked bursting husks
Of polished chestnuts; and the teeming store
Of mellow walnuts. Autumn tide hath come,
And pours from out her overflowing horn
Her welcome blessings on the grateful Earth!

The butternut, or white walnut, juglans cinerea, is the friend and favorite of every New England boy, and what one of them has not blessed his lucky stars all the days of his early years, if in some rocky pasture or out of the way corner of his father's farm were to be found some half dozen of these trees. Growing with equal rapidity with J. nigra, it only reaches a hight of from 30 to 60 feet with low spreading branches, extending horizontally, giving the tree a flat tufted head, hardly artistic, although very grateful to all boyish eyes. The form of the fruit is an oblong-ovate, with a tapering tip, rough with prominent irregularities; and woe to the boys' fingers, if missing the blow while cracking, the fingers come between the hammer and one or more of these "irregularities." The husk is thin and tough and of a dried brown appearance when ripe. Growing in clusters, of three to five on a stem, they often fall off as they grow, proving a great comfort to childish pickers, as a bunch of five fills a basket much more rapidly than a single nut. The kernel is sweet and pleasant, but from its abundance of oil, whence its name, requires care in drying, lest it become rancid.

The bark and shells, also, afford a brown color, sometimes used in dyeing wool, and a mild and

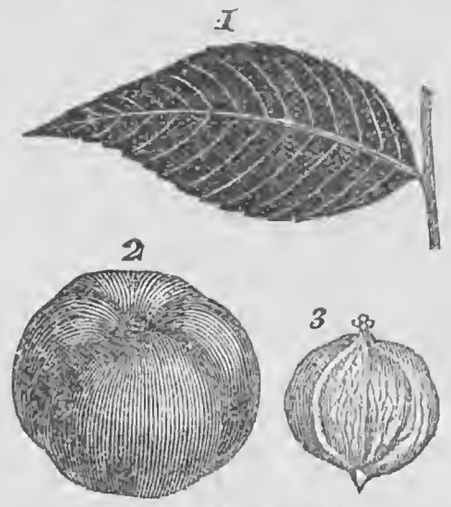


BUTTERNUT.—FIG. 352.

useful laxative is extracted from the inner bark of the root. According to an experiment published in the Massachusetts Agricultural Journal, the sap of the butternut is capable of producing as much sugar as that of the maple. Four of these trees yielding in one day nine quarts of sap, from which one and one-fourth pounds of sugar were made.

The hickory, Carya, belongs to the natural order of juglandacea, which comprises but two other genera besides this and the walnut. There are nine or ten species, all of them remarkable for stateliness and general beauty. In the autumnal scenery the hickories contribute a pleasing share to the vivid coloring, each species possessing its own peculiar tints, yet all of some shade of yellow, lighting up a hillside here with flaming gold, and there dropping into the most fashionable tint of "old gold" imaginable. The hickory is very desirable as an ornamental tree, having the compound leaves of the juglans order, composed of from five to 15 leaflets; from 60 to 80 feet in hight, of symmetrical build and stately appearance. The fruit is a large, roundish nut, the husk of which opens partially or wholly of itself by four seams. The different species vary so much in size and form that it is often impossible to distinguish them by one character alone.

The genus carya is exclusively American, of which we find many varieties. C. maxima bears



HICKORY NUT.—FIG. 353.

fruit as large as an apple with a very thick husk. The shell-bark or shag-bark hickory, C. alba, is easily distinguished by its shaggy bark, its excellent fruit and its rather small ovate leaf buds. The delicious flavor of its fruit is not surpassed by any foreign nut. The nuts vary greatly, some individual trees having nuts with astonishingly thin shells, and were it not for the difficulty of grafting these might be propagated; but attempts to graft the hickory are rarely successful, though it has been accomplished by setting the graft just below the surface of the ground, and the French nurserymen are said to succeed by herbaceous grafting, i. e., the scion and stock both of unripe wood. They are also very hard to transplant, having a large tap root and few of the fibrous roots. The nuts should be buried in the Fall, and planted in the Spring where the tree is expected to remain.

As a fuel the hickory excels all other Northern wood, making hard charcoal, and the ashes are very rich in potash. On account of the density and tenacity of the wood, it has a wide appreciation in the arts. Yet it is liable to the attacks of insects and decays rapidly if exposed to the weather.

The bitter-nut hickory, C. amara, is the most graceful and remarkable for its finely-cut foliage. Its recent shoots are of an orange-green, smooth and mottled with orange; its fruit, however, is intensely bitter and valueless.

The pig-nut, C. porcina, is also a large tree, with a close bark and tough, valuable wood, used especially for axe helves and wagon axles. The fruit is abundant, but of a disagreeable taste, useful only in the case of very hungry pigs—with good teeth, and little girls with lead pencils to make doll faces.

The mocker nut, C. tomentosa, varies much in thickness, size and shape of shell; the kernel is sweet, but very difficult of extraction, a fact which is supposed to have given it the name of mocker-nut.

In the woods of Pennsylvania and westward to Illinois and Kentucky, the Western shell-bark hickory, C. sulcata, is found, having a nut twice as large as that of the C. alba, but of inferior flavor.

The nutmeg-fruited, C. myristiceformis, is a rare and local species, found in South Carolina, the fruit of which is very small, smooth and brown, streaked with white and strongly resembling the nutmeg in appearance, but the kernel is very small and of little value.

The pecan hickory, C. olivaformis, is a more Western and Southern species, extending along the rivers as far north as Illinois, but not known except in cultivation in the Atlantic States. The nut is olive-shaped, has a very thin shell, on which people are apt to test the durability of their incisors, and if finding them up to the standard, proceed to use their molars on the sweet-flavored kernel contained therein, but if, instead, they succeed in gaining only a toothache, they are apt to fling away the pecan, denounce the nut-bearing trees of America generally and this one in particular, and—invest in peanuts thereafter.

The tree is usually from 60 to 70 feet in hight, but there is one growing at the Bartram estate near Philadelphia, said to be over 90 feet. The trunk is straight and finely formed, yielding a wood which, though coarse grained, is heavy and durable.

The pecan is rather late in coming into bearing, trees over 30 years old often bearing no fruit, but old trees in the forests bear abundantly. Like the shell-bark, the nuts of this species vary greatly in size and thickness, and the home traffic in both is very large, but large quantities of the pecan nut are shipped to Europe, where they are expressed to obtain their oil. The little port of Indianola, Texas, shipping some years as many as 100,000 bushels.

A GREAT REVELATION.

Some Valuable Thoughts Concerning Human Happiness and Timely Suggestions About Securing It.

Synopsis of a Lecture Delivered by Dr. Chas. Craig Before the Metropolitan Scientific Association.

"THE free and independent thought of this age accepts statements only where they are proven to be truth, while the development of mental power seems equally great in every other department of life. The valuable inventions of the day are counted by thousands. The increase of scientific study is universal. The spirit of inquiry in all fields is so marked as to cause

COMMENT ON EVERY SIDE,

while people seem investigating and advancing in every direction which can help them morally, mentally or physically. This is specially true of the human body and everything which concerns it, and the truths which the people have found, even in the last fifty years, are simply marvelous. How really ignorant some cultured and supposably scientific people were only a few years ago, as compared with the present day, may be better understood from a few illustrative facts. A prominent writer prepared an elaborate essay to prove that steamships could never cross the Atlantic, and his pamphlet was issued just in time to be carried by the first steamer that went to England. People once believed that the heart was the seat of life and health. It is now know that this organ is only a pump, simply keeping in moment what other and more important organs of the body have created and transformed. It was once supposed that if a person felt a pain in the back, the liver was deranged; if a pain came in the lower chest the lungs were affected and consumption was near; it is now known that a pain in the back indicates diseased kidneys, while troubles in the lower chest arise from a disordered liver and not imperfect lungs. A severe pain in the head was once thought to come from some partial derangement of the brain; it is now known that troubles in other parts of the body and away from the head, cause headaches and that only by removing the cause can the pain be cured. It is a matter of

PRIVATE HISTORY

that Gen. Washington was bled to death. His last illness was slight, and caused principally by weariness. A physician was called who 'bled him copiously.' Strange to say, the patient became no better. Another doctor was called, who again took away a large amount of the vital fluid. Thus in succession four physicians drew away the life of a great man who was intended by nature for an old age, and who prematurely died—murdered by malpractice—bled to death. That was the age of medical bleeding!"

The speaker then graphically described another period which came upon the people, in which they assigned the origin of all diseases to the stomach, and after showing the falsity of this theory, and that the kidneys and liver were the causes of disease, and that many people are suffering from kidney and liver troubles to-day who do not know it, but who should know it and attend to them at once, continued:

"Let us look at this matter a little more closely. The human body is the most perfect and yet the most delicate of all created things. It is capable of the greatest results and it is liable to the greatest disorders. The slightest causes sometimes seem to throw its delicate machinery out of order while the most simple and common-sense care restores and keeps them in perfect condition. When it is remembered that the amount of happiness or misery we are to have in this world is dependent upon a perfect body, is it not strange that simple precautions and care are not exercised? This is one of the most vital questions of life. People may avoid it for the present, but there is certain to come a time in every one's experience when it must be faced.

"And here pardon me for relating a little personal experience. In the year 1870, I found myself losing both in strength and health. I could assign no cause for the decline, but it continued, until finally I called to my aid two prominent physicians. After treating me for some time they declared I was suffering from Bright's disease of the kidneys, and that they could do nothing more for me. At this time I was so weak I could not raise my head from the pillow and I

FAINTED REPEATEDLY.

My heart beat so rapidly it was with difficulty I could sleep. My lungs were also badly involved; I could retain nothing upon my stomach, while the most intense pains in my back and bowels caused me to long for death as a relief. It was at this critical juncture that a physical longing which I felt (and which I most firmly believe was an inspiration) caused me to send for the leaves of a plant I had once known in medical practice. After great difficulty I at last secured them and began their use in the form of tea. I noticed a lessening of the pain at once; I began to mend rapidly; in five weeks I was able to be about and in two months I became perfectly well and have so continued to this day. It was only natural that such a result should have caused me to investigate most thoroughly. I carefully examined fields in medicine never before explored. I sought the cause of physical order and disorder, happiness and pain, and I found the kidneys and liver to be the governors, whose motions regulate the entire system."

After describing at length the offices of the kidneys and liver, and their important part in life, the doctor went on to say:

"Having found this great truth, I saw clearly the cause of my recovery. The simple vegetable leaf I had used was a food and restorer to my well-nigh exhausted kidneys and liver. It had come to them when their life was nearly gone, and by its simple, yet powerful, influence had purified, strengthened and restored them and saved me from death. Realizing the great benefit which a knowledge of this truth would give to the world, I began in a modest way to treat those afflicted, and *in every case* I found the same

HAPPY RESULTS

which I had experienced. Not only this but many, who were not conscious of physical trouble but who, at my suggestion, began the use of the remedy which had saved my life, found their health steadily improving and their strength continually increasing. So universal, where used was this true, that I determined the entire world should share in its results, and I therefore placed the formula for its preparation in the hands of Mr. H. H. Warner, of Rochester, N. Y., a gentleman whom I had cured of a severe kidney disease, and who, by reason of his personal worth, high standing and liberality in endowing the Astronomical Observatory and other public enterprises, has become known and popular to the entire country. This gentleman at once began the manufacture of the remedy on a most extensive scale, and to-day Warner's Safe Kidney and Liver Cure, the pure remedy that saved my life, is known and used in all parts of the continent.

"I am aware a prejudice exists toward proprietary medicines, and that such prejudice is too often well founded, but the value of a pure remedy is no less because it is a proprietary medicine. A justifiable prejudice exists toward quack doctors, but is it right that this prejudice should extend towards all the doctors who are earnestly and intelligently trying to do their duty? Because Warner's Safe Kidney and Liver Cure saved my life before it became a proprietary medicine, is it reasonable to suppose that it will not cure others and keep still more from sickness now that it is sold with a government stamp on the wrapper? Such a theory would be childish."

The doctor then paid some high compliments to American science, and closed his lecture as follows:

"How to restore the health when broken and how to keep the body perfect and free from disease must ever be man's highest study. That one of the greatest revelations of the present day has been made in ascertaining the true seat of health to be in the Kidneys and liver, all scientists now admit, and I can but feel that the discovery which I have been permitted to make, and which I have described to you, is destined to prove the greatest, best and most reliable friend to those who suffer and long for happiness, as well as to those who desire to keep the joys they now possess."

PERSONAL ITEMS.

Mr. Thomas Carlyle is suffering from insomnia.

Robert Toombs, of Georgia, intends to build a cotton factory worth $200,000 at Washington, in that State.

Ex-Congressman Eugene Hale denies the report that he is going to move from Maine to Michigan. He will stay in Maine and watch the Senatorship.

Mr. Samuel H. Gladstone, a cousin of the Premier, is now in this country for the purpose of buying land in Colorado or some other Western State.

The return of the King and Queen of Greece to Athens on Sunday was the cause of a great local and patriotic demonstration. Public opinion favors action against Turkey, even without foreign support.

The girls who were to be confirmed recently in St. John's Roman Catholic Church, Concord, were officially informed beforehand by the Bishop that he would not lay his hands on any head that bore banged or frizzed hair.

The death of the venerable Peleg Sprague leaves Hannibal Hamlin as the senior living representative of Maine in the United States Senate. All who had preceded him are now dead, as well as Nourse and Fessenden, who came after.

Agent Meeker's remains were removed from the White River Agency to Greeley, Col., a few days ago. Miss Josephine Meeker, the agent's daughter who passed through a terrible ordeal while a captive of the Utes, has regained her health.

Mayor Rose of Davenport, Iowa, threw the first shovelful of earth in the work of excavating for a soldiers' monument in that city. "Twenty-one years ago," he said, in his address, "I was shovelling very near this spot for a dollar a day."

Among the passengers by the steamer Scythia from Queenstown for New York this week, was Viscount Lymington, Liberal member of Parliament for Barnstable, who intends to study the land system and agriculture in the United States.

Charles Talmadge, son of an ex-Mayor of Milwaukee, and recently married to one of the most respected young ladies in that city, has been caught at burglary. He made a practice of crawling through transoms into business offices to steal.

Ex-Senator Simon Cameron recently bought a dwelling house built on the lot of ground in Maytown, Lancaster County, on which stood the house in which he was born, in 1799. He has presented the house to the Lutherans of Maytown, the house to be used as a Lutheran parsonage, and to stand as a memorial to his wife, Margaret Brua Cameron, who was a devout Lutheran.

[Logan (Ohio) Hocking Sentinel.]

Hocking Valley News.

In the absence of anything startling or terrific—politics and the exploits of the army worm excepted—news from this delightful valley will not prove nerve-tingling. However an item of very great importance to many people is communicated by Mr. F. Harrington, Wholesale and Retail Druggist of Logan, who thus writes: Mr. Alex. McClurg, Union Furnace, states that his wife had been afflicted with rheumatism for the last twenty-five years, being unable to walk without canes or other help the most of that time; has now used two bottles of St. Jacob's Oil and walks not only about the house but also in the fields without any help.

KIDNEY-WORT

The Only Medicine

That Acts at the Same Time on

The Liver, the Bowels and the Kidneys.

These great organs are the natural cleansers of the system. If they work well, health will be perfect; if they become clogged, dreadful diseases are sure to follow with

TERRIBLE SUFFERING.

Biliousness, Headache, Dyspepsia, Jaundice, Constipation and Piles, or Kidney Complaints, Gravel, Diabetes, or Rheumatic Pains and Aches,

are developed because the blood is poisoned with the humors that should have been expelled naturally.

KIDNEY-WORT

will restore the healthy action and all these destroying evils will be banished; neglect them and you will live but to suffer.

Thousands have been cured. Try it and you will add one more to the number. Take it and health will once more gladden your heart.

Why Suffer longer from the torment of an Aching back? Why bear such distress from Constipation and Piles?

KIDNEY-WORT will cure you. Try a package at once and be satisfied.

It is a dry vegetable compound and

One Package makes six quarts of Medicine.

Your Druggist has it, or will get it for you. Insist upon having it. Price, $1.00.

WELLS, RICHARDSON & CO., Proprietors,

10 (DRY, and post paid.) Burlington, Vt.

Liquid KIDNEY-WORT

In response to the urgent requests of great numbers of people who prefer to purchase a **Kidney-Wort** already prepared, the proprietors of this celebrated remedy now prepare it in liquid form as well as dry. It is very concentrated, is put up in large bottles, and is equally efficient as that put up dry in tin cans. It saves the necessity of preparing, is always ready, and is more easily taken by most people. Price, $1 per bottle.

LIQUID AND DRY SOLD BY DRUGGISTS.

CLARK'S IMPROVED ROOT CUTTER

PERFECTION OBTAINED IN

CUTTING ROOTS

This Cutter has *received* the First Premiums *at every Fair*, and has no *equal*. Do not fail to examine it.

The Neatest, Strongest, Simplest, Cheapest, and most Perfect Root Cutter in the Market.

This Cutter is built with a heavy oak frame, well bolted together; is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of *twenty-five steel knives* (gouge shaped), so arranged on a wrought-iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are neatly cut in pieces suitable for feeding. No coarse, ungainly pieces are left by this Cutter. A boy can easily cut 25 to 40 bushels per hour, so easily does it do its work. ☞ Don't fail to examine it.

We are manufacturing three sizes, designated by numbers,—1 2 and 3.

Nos. 1 and 2 designed for hand use.

No. 3 is the Power Cutter, and will cut 100 bushels per hour.

NEW PREMIUM CORN SHELLER.

ONLY $1

Sent by mail postpaid on receipt of price.

Cannot get out of order. Will last a lifetime.

This is the only Cheap Practical Hand Corn Sheller in the market and is in every way the

BEST HAND CORN SHELLER EVER INVENTED.

Shells 25 to 30 bushels a day **very easily.** Is especially recommended to farmers who shell large quantities of corn for seed. It has been customary to remove the imperfect kernels from both ends of the ear with the hand, and use the full, perfect kernels of the center for seed. This is a long, tedious process, but with this sheller it can be done in one-tenth the time. To poultrymen, to seedsmen and to anybody who shells corn, we recommend it. Can be carried in the pocket and samples of corn taken from any part of the field by shelling only part of an ear.

Our PREMIUM CORN SHELLER is destined to become the **Leading Hand Corn Sheller** of the day, and you will find it profitable and to your advantage to secure the sale of it. When it is once introduced no other small sheller will be wanted in your locality. This Sheller opens a new field for reliable agents. A very profitable business can be done upon a small capital.

Believing this to be the Best Low Priced Corn Sheller ever invented we have secured the General Agency for the United States, and we want

CANVASSING AND LOCAL AGENTS IN EVERY COUNTY.

Sample sheller and price list sent prepaid to any address upon receipt of $1.

Humorous.

KISSING is somewhat like seven-up. If he begs, and she thinks she can make points in the game, she will give one.

A SYRACUSE grocer used to smoke his pipe while leaning against the kerosene barrel. His mail now goes to the dead letter office.

ONE of the first requisitions received from a newly-appointed railway station agent, was: "Send me a gallon of red oil for the danger lanterns."

"THERE'S one kind of ship I always steer clear of," said an old bachelor sea-captain, "and that's courtship, 'cause on that ship there's always two mates and no captain."

A MOBILE paper describes a young lady with hair "as black as a raven's." The ravens weren't wearing any hair to speak of last Summer, but we suppose the style has changed this year.

"ELLA, is your father at home?" said a bashful lover to his sweetheart; "I want to propose something very important to him." "No, Clarence, papa is not at home; but I am. Couldn't you propose to me just as well?" And he did, with perfect success.

I WAITED anxiously with dread unfeigned—I held my breath, my utterance was choked—My muscles twitched, my every nerve was strained—With humid tears my handkerchief was soaked—Till in a moment agony was eased—I quickly turned my head aside—and sneezed!

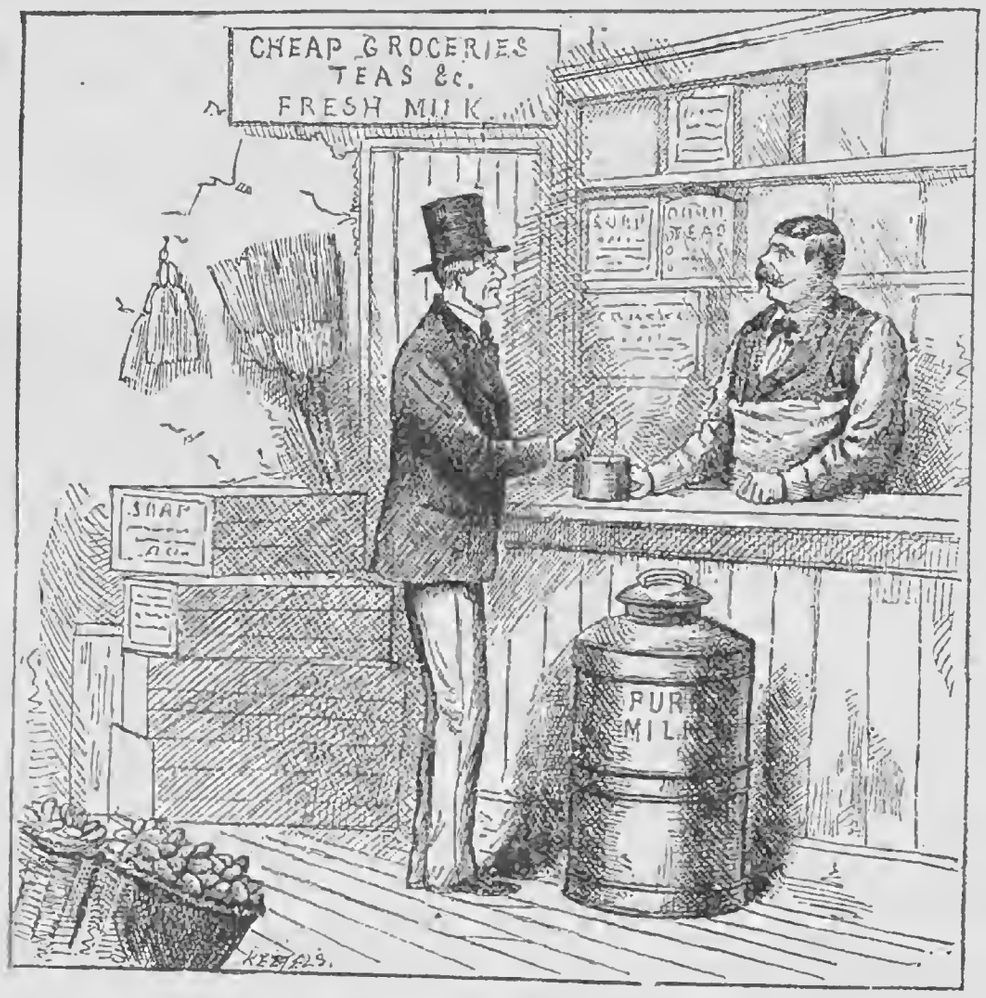
A GENTLEMAN, recently about to pay his doctor's bill, said, "Well, doctor, as my little boy gave the measels to all my neighbor's children, and as they were attended by you, I think you can afford at the very least to deduct ten per cent. from the amount of my bill for the increase of business we gave you."

A SOLDIER of a cavalry regiment was brought up for stealing his comrade's liquor ration. He was an Irishman, and his defence was unique. "I'd be sorry indade, surr, to be called a thief. I put the liquor in the same bottle, and mine was at the bottom, and sure I was obliged to drink his to get at my own!"

"How came these holes in your elbows?" said a widowed mother to her only son. "Oh, mother, I hid behind the sofa when Col. Gobler was saying to Maria that he'd take her even if you had to be thrown in; and he didn't know I was there; and so I held my tongue and laughed in my sleeves till I burst 'em."—[Littell's Living Age.

"WHY, Bridget," said her mistress, who wished to rally the girl, for the amusement of her company, upon the fantastic ornamenting of a plate of butter, "Why, Bridget, did you do this? You're quite an artist; how did you do it?" "Indade, mum, it was myself that did it," replied Bridget. "Isn't it pritty, mum? I did it with your fine-tooth-comb, mum."

"CAN you tell me where to buy a white shirt?" said a gawky fellow to a man at Lexington, Ga. The information was given, and the inquirer—who was accompanied by a blushing girl—said to the merchant while buying the shirt: "Can you tell me where to get a marriage license?" Of the license clerk he asked: "Who's the best minister to tie the knot?" Thus the couple cautiously proceeded toward matrimony.



INSINUATING.

Customer.—"Give me a pint of half-and-half!"
Grocer.—"Half-and-half?"
Customer.—"Exactly: half milk, half water."

Poisoned Atmosphere,

And poisoned water, having lost their purity and become contaminated with the rank effluvium and noxious soluble products of decaying vegetation, breed not only malaria in its various forms, but give rise to disorders of the stomach, liver and bowels, always of a dangerous character. No antidote to malarial poison has yet been discovered which has so signally demonstrated its remedial value as Hostetter's Stomach Bitters, which breaks up the worst paroxysms of fever and ague and bilious remittents, and prevents the first attacks, or a recurrence of these and kindred malarial disorders. As a stomachic and general tonic, as a recuperant of vital energy, and as a restorative of bilious regularity, active secretion, and a healthy habit of body, this preparation is unrivalled. Throughout those portions of the United States and in tropical countries where such disorders are prevalent, it is regarded as a standard anti-malarial specific.

VOL. XXXIX. No. 45.
WHOLE No. 1606.

NEW YORK, NOV. 6, 1880.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Vineyard.

THE JEFFERSON GRAPE.

MR. RICKETTS's grapes are quite dissimilar in appearance and flavor. A complete collection would seem to supply all that the lover of grapes could desire, if only such a collection could be made to thrive in the same locality, which we presume will rarely, if ever, prove to be the case. The Jefferson is now offered for sale by Mr. J. G. Burrow, of Fishkill, Duchess County, N. Y., who controls the entire stock. Our engraving is a true reproduction of an average size bunch which was sent to this office by Mr. Burrow, not knowing it was to be drawn and engraved. We have a specimen vine of the Jefferson at the Rural Grounds, which has not yet fruited or, indeed, made a very strong growth. In other places, however, we hear it has grown vigorously. Mr. Charles Downing, at our request, gives his opinion of this grape, which is as follows:—

JEFFERSON.—One of James H. Ricketts's Seedlings—a cross between Concord and Iona; vine a vigorous grower, rather short-jointed; leaves, large, thick and downy; bunch, large, sometimes very large, shouldered, very productive; shoulders, often double, compact; berry, medium large, roundish-oval; skin,

THE JEFFERSON GRAPE.—Drawn from Life.—Fig. 354.

thick, light, bright red, with a thin whitish bloom; flesh, meaty, crisp, tender, juicy, sweet, slightly vinous and aromatic; quality very good or best. The berries adhere well to the peduncle. It ripens about with the Concord, and is a promising grape, both for home use and market.

Mr. Bateham said of this grape as follows:—

This, to my mind, is the most promising of all Mr. Ricketts's Seedlings, if there is no mistake as to its parentage, which is claimed to be Concord crossed with Iona. The fruit resembles Iona in color and size of bunch and berry, but the quality is not so rich and vinous, but more sweet and meaty.

Mr. George W. Campbell, of Delaware, Ohio, says:—

The quality of the Jefferson grape is entirely satisfactory. Indeed, I have seen no native red grape the flavor of which pleases me so well. To my taste it is superior to the Iona; and if it proves generally hardy, healthy and productive, it will merit a cordial reception from all grape-growers, and will, doubtless, command an extensive sale. There can be no question as to the beauty and excellence of the fruit, and if the character of the vine proves satisfactory, it must rank as one of our best and most valuable grapes.

NEW GRAPES OF WESTERN NEW YORK.

E. WILLIAMS.

LAST SPRING Secretary Woodward, of the Niagara Grape Company, sent me an invitation to visit them this Fall and see the Niagara growing. As this method of observation is the only safe one by which to arrive at satisfactory conclusions respecting the merits of any new fruit, next to growing and observing it on one's own ground, I decided to accept the invitation. Having induced an amateur friend to join me for company's sake, we took an evening train of the New York and Lake Erie Railroad from Jersey City on the 22d of September, arriving at Buffalo at eight o'clock the next morning. After breakfast we took a train to Dunkirk and thence to Fredonia, to the grounds of T. S. Hubbard, to first see and inspect

The Prentiss,

a new native white grape now being offered for sale for the first time.

At the outset Mr. Hubbard informed us that the fruiting vines of the Prentiss were at Pulteney; his vines were grafts set the year previous, and not a fair sample of its capacity. We, however, had an opportunity to observe the foliage and growth of the vine in comparison with others. In one part of the vineyard there was some mildew on the foliage, but it was not seriously affected, while Delaware, Croton and several others were entirely denuded. The Prentiss is a seedling of Isabella, a good grower, but not as stout and vigorous as its parent. A one-year-old vine on my own ground, received from Mr. Hubbard last Spring, has made a growth of 12 feet, and the wood is apparently well ripened. The bunch of the Prentiss is medium, compact: berries, slightly oval, from one-half to five-eighths of an inch in the short diameter, juicy, sweet and pleasant; it keeps well The vine is very productive. Samples of the fruit in fine condition were shown at the Winter meeting of the New Jersey Horticultural Society last January. This keeping quality alone must make it a valuable addition to our list of pure native grapes. We had the pleasure of tasting a great many other varieties in his trial grounds, including several of Rogers's Hybrids, which were new to us. We were particularly impressed with No. 32 (red) and No. 39 (black) for their large berries, good bunches and heavy crops. For a show my friend thought them ahead of all the rest. Mr. Hubbard, as is well known, is an extensive propagator of vines for the trade. He has about thirty acres in young vines, and as he puts about 30,000 cuttings on an acre, the reader can form some idea of the extent of his business.

In our rambles with Mr. Hubbard we accidentally stumbled into the flower garden of a Miss Denton, and such a show of balsams, portulacas and zinnias I never saw before. A large bed of the last, perfectly double, dark scarlet and a mass of bloom, far surpassed in beauty, to my eye, any massing of salvias I have ever seen. Such a gem was worth going miles to see.

Returning to Buffalo by the evening train, we went on to Niagara Falls and passed the night. The next morning we took an early train for Lockport, 20 miles distant, reaching that town at eight o'clock A. M. Not finding Mr. Woodward in town, we inquired our way to Mr. Hoag's, a mile or two distant, and wended our way thither. We here learned that he, too, was temporarily absent; but we were warmly welcomed by his genial wife, and invited to an easy-chair on the spacious piazza to await his return. And here we fell into good company by finding the Hon. Shelby Reed and D. E. Rogers, of Scottsville, on the same mission as ourselves. These gentlemen are prominent farmers and fruit-growers, the former being President of the Western New York Farmers' Club and member of the Board of Control of the Agricultural Experiment Station, and the latter is the originator of the new and promising seedling peach named Wheatland. In such good company the hour sped quickly by till Mr. Hoag's return was announced. Making known the object of our visit, we were invited to walk out and inspect

The Niagara

at home. We were accompanied by Mr. Smith, the President of the company owning the grape, and by the father of our host, a gentleman of 84, who was as agile and spry in his movements as the youngest of us.

The "lay of the land" is gently sloping to the south, at the foot of the hill range north of the canal, much lower than the town itself or the adjacent county; not to my view the most favorable location for the best results. It is an old vineyard site of Ionas, Delawares, etc., set when those varieties were in their zenith. They eventually failed and were rooted out. Strawberries followed them, and they, in turn, were followed by these grapes, being set with one-year-old vines in the Spring of '78. The rows run north and south about 10 feet apart; the vines are trained with horizontal arms on wire trellises about five feet high. The vines are very vigorous in growth, covering the trellises completely with a dense mass of large, thick, leathery, dark-green foliage. Several rows of Hartfords adjoining were badly infected with mildew, while on the Niagaras only now and then a leaf showed any sign of its presence. These young vines bore ample testimony as to productiveness. Two of them had had some of the lower leaves removed for the purpose of photographing them. One of these vines contained 63 clusters of fruit, the fruiting canes being confined to two arms, each two feet six inches long. The weight of the fruit, estimated by several of the party, varied from 21 to 30 pounds, and each thought his estimate a low one. We saw the original vine, which was layered in '76, producing 48 layers. The year following it produced 30 pounds of fruit, some clusters weighing 14 ounces, and it was heavily loaded at the time of our visit.

The bunches are large, compact, sometimes shouldered, green in the shade, of a fine, delicate amber color in the sun, and so transparent that the seeds are readily seen when held to the light. The berries are large, oval, three-quarters by seven-eighths of an inch by actual measurement, with a thin, tough skin, adhering firmly to the peduncle. We lifted several clusters of one-half pound weight by a single berry. The flesh is tender, sweet and juicy, with more foxiness in the smell than in the taste. The standard of quality will vary with individual tastes, some declaring the Niagara equal to foreign grapes, while others would discard it for its foxiness. The clusters exposed to the sun are the sweetest, richest and handsomest. Judging from the testimony of those who have tasted the samples I brought home, it will please if not satisfy 99 out of 100.

Another important feature is its early ripening and long keeping and carrying qualities. On the 24th of August, just a month previous to our visit, a gentleman from Hammondsport took a basket of fruit with him—at which time it was considered riper than the Hartfords alongside—and at this writing a bunch on my table looks almost as fresh and plump as when taken from the vine four weeks ago. These vines have had an annual dressing of ashes and plaster. Your illustration in the RURAL of October 25th, 1879, does it no injustice, unless it is that the clusters are really a little more compact than they there appear.

But the question comes up, will it not do as well away from home? Nothing short of actual trial will answer this; but I see no reason to doubt—taking into consideration all its characteristics—that it will succeed well wherever the Concord or Hartford thrives, and my only regret is to announce that the company who control the whole stock do not expect to offer vines for sale under a year or two; and when they do, they propose to send them out under seal so that every purchaser can, if he choose, have a guarantee against fraud. This is a laudable desire on their part, but unscrupulous parties will sell spurious vines for it, if they can make money by so doing, and if their customers are humbugged it is their own fault. Besides grapes Mr. Hubbard has planted dwarf pears (Duchesse) quite largely, and has a fine quince orchard of seven or eight acres, producing a large crop which he had commenced marketing in Chicago at five dollars per barrel.

Thence we went to Rochester and the next day walked to Mr. Chorlton's to see

The Pocklington.

This is also a native, a seedling of the Concord, and it has the same strong, tough leaf as its parent. The vines, too, are strong and vigorous, but the fact that it was set last year on ground that had been in evergreens, will account for any apparent lack of vigor and productiveness. The fruit had been mostly gathered; that remaining was covered with netting to protect it from the birds. The clusters are large and compact; the berries round, averaging perhaps a little larger than the Niagara, of pale green or light amber color, sweet, thin-skinned with tough pulp, and, as Mr. Chorlton says, "if we can endure the foxiness"—a fatal objection to some people—it will become popular. On our return we called at

Mr. Hooker's Nursery,

to see the original Brighton vine which still reserved a small portion of its large crop for our palate, and still maintains its character as one of the best hybrids extant. Mr. Hooker also showed us Emmelan, very fine—evidence that it *does* succeed in some places. Here also all the choice varieties had to be covered with netting to protect them from the birds, but the Champion hung drying on the vines unmolested. The birds want better fruit, so does Mr. Hooker, and my experience with it this season forces me to the same conclusion. Even if it is a few days or hours earlier than others, they are so much better we can afford to wait. Mr. Hooker is paying considerable attention to the clematis, and showed us a fine display of the Fall bloomers.

A visit to Rochester would be far from complete without calling at

The Flower Farm of Vick,

the celebrated seedsman, who we regret was in town when we called. Though late he had a fine show of gladiolus, chiefly seedlings; zinnias, cannas, etc., etc. Among potatoes I learn the "Chicago Market" is destined to take a front position. As an indication of his prosperous business, I am glad to note the erection, in the center of his flower garden, of a massive and imposing four-story brick building, about 50x150 feet, into which he had just moved, to accomodate his immense business The first floor is to be devoted to the printing and publishing of his magazine, catalogues, seed bags, etc.; the second and third floors to offices, the packing and mailing departments; and the fourth story to storing seeds. When once settled and in running order, this building will be well worth inspection, as it will be about as near perfection as human ingenuity can make it, for Mr. V. is just that kind of a man. A cursory glance over

Ellwanger & Barry's Home Grounds

showed that the pear blight had visited their splendid experimental pear orchard and somewhat marred its beauty since I last saw it; but, notwithstanding this, it was producing the finest crop of pears I have seen anywhere this season. The apple crop of Western New York is, as here, very abundant, and the evaporating establishments are welcome messengers in relieving the market.

I might extend these notes to an indefinite length, did space permit; but the design was merely to chronicle for the benefit of RURAL readers the results of my observations on the white grapes for which the trip was especially made. I regret very much I could not have seen the Duchess at home, by way of contrast with the others, but other duties prevented my doing so till it was too late, and I can only say that the four vines on my own ground have made such a vigorous and healthy growth as to greatly disappoint me, and I am very hopeful regarding its future.

Returning we enjoyed gazing at the ever-changing Autumn landscape for which this country is famous.

"Till night drew her sable curtains o'er the earth,
And pinned them with a star."

The forest-covered hill-sides had put on their finest and brighest colors, embracing every shade and hue of amber, yellow and crimson, and as the evening sun shed his parting rays on the scene, it formed a painting after Nature which my companion declared the most beautiful picture he ever saw. Thus ended our trip and here end our notes thereon.

Cinnaminson, N. J.

The Niagara Grape.

We have received a box of these grapes from Mr. J. S Woodward, of the Niagara Grape Company, Lockport, N. Y., who writes to us:—

"I take the liberty of sending you to-day by express a small box of "Niagara" grapes, that you may compare them with those sent from the State fair. These were fully ripe by August 20, and were cut on October 20, thus having hung ripe on the vines two full months. In tasting and comparing them, remember they are entirely and purely native, as hardy and vigorous as the Concord and more productive. The leaves are yet green and vigorous, while all others in the vineyard are off or are turned a dead yellow. You will observe the difference in color between those that were in the sun and those in the shade."

Oct. 21.

[The above were received in perfect order, each grape as sound as a nut. The Niagara is just what is needed in our markets to-day. The quality is no better than that of Concord, but the vigor of the vine and the keeping qualities of the fruit, so far as can be judged, cannot be questioned.—EDS.

Some Disinterested Testimony Respecting the Niagara Grape.

Last week the Rural Farm was visited by Dr. Henry Stewart, Dr. F. M. Hexamer, Dr. A. R. Ledoux, Mr. C. V. Mapes, and Mr. E. Williams. During their visit a dish of white grapes (the name was not mentioned) was placed before them, and each one was requested to state his opinion of their quality. Mr. Williams, said: "It appears to be the Niagara, though they are richer and better than Niagaras I have before tasted. Whatever it is, if you can grow that grape, you will go a long way to find one better."

Dr. Ledoux, said: "It is splendid."

Dr. Hexamer, said: "It comes the nearest to Niagara of any grape I can think of, though it seems rather better. The Niagara is the greatest step in advance since the Delaware."

Dr. Stewart, said: "It is a first-class grape—far ahead of the Niagara."

Mr. Mapes, said: "I thought it a hot-house grape."

The grapes were sent to us by Mr. Woodward, as elsewhere noted in our present issue.

Pomological.

KEEPING WINTER APPLES.

THE question is being discussed as to whether a dry or a wet cellar keeps apples best. A writer in the New York Tribune says apples keep excellently in his cellar, which is a wet one, and cites the remark of an experienced buyer that whenever he entered a cellar and was compelled to walk on boards to keep out of the water, he was sure to find the fruit in good condition. On the other hand, many writers recommend a dry cellar as the best for keeping apples. Who shall decide the question?

That water is not injurious to the keeping of apples, even when actually in contact with them, is shown by the fact that they keep perfectly well on the ground under leaves all Winter. A friend of mine living in Montreal says that seeing some very fine Fameuses exposed for sale in that city, he inquired how they were kept. He learned that they were part of the cargo of a canal boat which had sunk in the canal and was frozen in before it could be raised. When this was effected in the Spring, it was found that the cargo of apples, which would not have kept much longer than January in the air, had been preserved perfectly in the water. An old custom of burying apples in the ground, the same as roots, for Winter storage, also demonstrates that moisture in contact with apples does not necessarily cause rotting. In Russia I understand that apples are preserved in tight barrels with water, in the way practiced in this country with cranberries. On the other hand, apples keep perfectly in dry cellars, as many fruit growers can testify.

What then is the essential requisite for the safe Winter keeping of this fruit? Simply, I believe, the preservation of a low uniform temperature as near the freezing point of water as possible. This can be maintained in dry cellars, but much more easily and perfectly, I think, in wet ones. The presence of water has a controlling power over the variations of temperature near the freezing point, as all know who have had to keep water in a cold cellar to keep it from freezing. The moisture does no harm to the apples. It may even be a direct benefit in preventing evaporation from and consequent withering of the apples, though this evaporation is very slight at the low temperature necessary in fruit cellars for success in keeping apples over until Spring. In Canada apples are rarely stored for keeping in house cellars. A special cellar is made, deep, with thick stone walls laid in mortar. These walls rise above the surface only about ten inches, to allow of small windows for ventilation and light. There is a double floor above filled in with moss or sawdust. This floor is covered by a roof-like attic and the apples are there kept until the approach of severe frosts, when they are sorted, barreled and lowered into the cellar through a trap-door which is then closed and packed in the same way as the floor. At times during the Winter when the weather is not freezing this cellar is opened and fruit removed for sale. When properly made and managed there is little or no loss in the way of storing Winter apples. T. H. HOSKINS, M. D.

Farm Economy.

CIDER MAKING.

To the fact that the apple crop does not come regularly every year may be attributed the other fact that there is a want of the same systematic process of making and keeping cider as is found in wine making. The juice of the apple, as of all other edible fruits, is capable of manufacture into a wholesome, palatable beverage, or of fermentation into vinegar or distillation into liquors, just as the producer and manufacturer may determine.

These fruit juices vary in character in differ-

ent kinds of fruits and in different varieties of the same fruit, and to insure the finest product the best quality of juice is required. As generally made, cider is but the product of a scraping together of the refuse of the orchard, some apples giving juice of one kind of strength and some of another, while some of the apples may be windfalls and partially ripened, or over-ripe and decayed. This is an unfavorable condition for making fine cider, but if the object be simply to save as much as possible of the orchard refuse, then this irregular plan may be the only practicable one.

But in so far as ripe, perfect fruit is selected, and that of a quality of juice corresponding in richness, and care and skill are used in the process of manufacture will the result be favorable. The apples should be fully ripe, sound and free from stems and leaves or other foreign substances. Apples having a slightly astringent flavor make cider which keeps best, and, when practicable, apples should be left to become ripe and sweetened and dry by exposure to the Autumn sun before being worked up. They gain in sugar and lose in water by such exposure.

Cider made early in the season has less body and does not keep as well as that made in cooler weather, nor can fermentation be as easily controlled. Cider made after the first of November is likely to have better keeping qualities, a better body and a higher flavor. When made from apples of the same kind it is easier to regulate fermentation and easier to preserve the cider, and apples should be selected with this object in view so far as practicable.

There are various opinions in regard to presses and crushers, some preferring to have apples crushed fine, but the juice then is more muddy and cannot be clarified as easily. If pressed as soon as crushed, the juice will be of a light color, but when the apples are coarsely ground and the pomace allowed to remain in the vats for some time before pressing, the juice will have a deeper color and an appearance of greater richness. A heavy pressure brings out more of the sugar and fruit flavor and the cider has better keeping qualities.

On the care and handling of the juice the quality of the product largely depends. For wine making, cool, underground cellars are provided and the fermentation carefully regulated, and with cider making the process of fermentation should go on at as low a temperature as possible, and the barrels should be kept full at all times that the impurities may overflow. When sufficiently fermented, the cider should be drawn off into clean casks or vessels or bottled direct. Old cider makers usually have some special process which they use in their cider making, the advantage of which has been learned by experience, but the business of fine cider making is yet in its infancy, and there is room for a great deal of improvement.

Some add sugar before the juice begins to ferment, and others put in alcohol and others mustard seed, but the simplest process for the farmer who makes but a few barrels is to endeavor to conduct the fermentation at a low, even temperature and then to draw off the clear cider, being careful not to disturb the settlings, and either bung tightly or bottle and wire.

Old liquor casks are best for keeping cider, but if new ones are used they should be fumigated with sulphur, by dipping strips of cloth in sulphur and then lighting and suspending them inside the barrel, which is then bunged up to keep in the sulphur till the barrel is wanted for use.

Various substances are added to cider to stop fermentation—sulphite of lime, salycilic acid, etc., etc., but none of these improves the character of the cider, but rather injures it, and retards the ripening by which a true cider is obtained. Professional cider and wine and vinegar makers use elaborate processes combined with skill gained from experience and by the construction of cool cellars, and are rewarded accordingly. There is yet room for much effort in this direction. Cider may be bottled securely at the close, or near the close, of the first fermentation and will become sparkling in a short time. Cider which has become stale may be bottled and a lump of sugar added and it will become sparkling.

HANDLING FLAX.

Although in frequent cases, after the flax has been thrashed, the stalks are sold to the manufacturer to prepare the fiber for use or sale, yet as this is often done either wholly or, more commonly, in part, by the farmer himself, a short account of the processes will be either of use or interest. The flax stalk consists of three parts:—first, a woody, central hollow stem, called the "shove," "shoove," "shives," "boon" or "hurl;" second, a fibrous sheath surrounding the "shove," and, third, a delicate outside covering of skin or bark. The fibrous sheath or fiber—the only valuable part of the stalk—is held fast to the "shove" by means of a mucilaginous substance, and the object of the subsequent processes is to separate it completely from its worthless surroundings.

Rotting or Retting has for its object to dissolve this glutinous substance, and when the process has been properly attended to, the shives readily separate from the fiber. There are two ways of rotting flax—acriel or dew rotting, and water rotting or steeping. The former is the slower, but being the more convenient and the less unpleasant, it is the mode commonly practiced in this country. As soon after the harvest as convenient the stalks are carried to a smooth grass plot and spread out in long swaths, care being taken to spread them of a uniform thickness of a quarter to a half inch, with the butts even and the straw straight. To prevent tangling and to facilitate turning a space of a few inches should be left between the adjacent swaths. In a week or ten days the swath should be turned upside down by running a long, slim pole under it and turning the "poleful" over. This can be done better by two men, or a man and a boy, with a long pole than by one man with a short pole, because when a portion of the swath is raised the part connecting it with the rest of the swath is likely to become more or less tangled unless somebody stands on the part where the separation is to be made. Some only turn the flax once—when the top side is thoroughly weathered; it is better, however, to turn it twice, lest the under side should become moldy, especially on wet ground. Dew rotting takes a longer time in cold and dry than in wet and warm weather, alternate rain and sunshine being the most favorable condition for speedy rotting. The period varies from three weeks to double that length. The flax is sufficiently rotted when the stalks assume a silver-gray color, and the stem, if it is bent between the fingers when dry, snaps like glass, and the fiber separates freely from the shives. The straw should then be collected by rake, or, preferably, by hand, and bound in moderate-sized sheaves, which should be set on end until thoroughly dry.

In water rotting the flax is either placed in a sluggish stream, or a pit is prepared for it, through which there is a flow of water from a stream or spring. "Soft" water, however, dissolves the mucilaginous substance sooner than "hard" water, and water impregnated with iron or other mineral matter is unsuitable, as it is apt to discolor the fiber. A like effect is produced in a stagnant pool, so that a change of water is necessary to a satisfactory result. The flax in the water should not touch the ground, so that it is always convenient to make a rough platform, four or five inches from the bottom, of rails or boards held down with stones or stakes for it to rest on. On this the bundles are placed in an inclined position and the water is let into the pit until it is four or five inches over the top of the flax, which is held down by stones or other weights or by poles laid across and prevented from rising by being fastened to stakes. If the flax is over-rotted the fiber is injured or ruined, so that great care must be taken to prevent this mishap. The cooler the water, the longer the flax will be in rotting; but if of the right temperature the process should be completed in six or seven days. After steeping five days the flax should be frequently examined to determine whether it is rotted enough. To decide this point, take from the center of a bundle an average-sized straw; break a piece about six inches long from the middle of it, and draw the boon downwards; if sufficiently watered it will slip from the fiber without breaking the latter. The bundles should then be lifted out carefully, unbound, and the flax spread out to dry on the grass in swaths, much the same as in dew rotting.

If it has been taken a trifle too soon out of the water the rotting can be completed on the grass. When the flax has been rotted enough, it is gathered in bundles and housed, stacked or sold. In some places rotting is followed by firing, especially when the rotting has not been sufficient. This is done by spreading the flax thinly, either on a rack about four feet high, under which a low fire burns; or over an underground flue, through which the heat from a fire passes. Manufacturers generally prefer to buy the fiber either before or after rotting, as they usually have conveniences for performing the other operations better than they can be performed on the farm.

Breaking, when done on the farm, is performed either with a hand or power "break," the object being to break the straw across at short intervals so as to facilitate the separation of the shives from the fiber. By shaking the broken stalks well most of these are got rid of, and those that still remain are worked out by

Scutching.—For this a scutching or swingle board is needed—an upright, hard-wood board of a convenient hight, fastened at the bottom to a horizontal support or sunk in the ground. On the top of this, or, better in a notch cut at a convenient hight in the side of it, a handful of the broken flax is placed, and struck sharply, close to the board, with a scutcher or swingling knife—a hard-wood, doubled-edged knife about two feet long. Each handful of flax is turned and shifted on the board until the shives are thus beaten off. A revolving power scutcher with a number of knives arranged like the spokes of a wheel, is also used for the same purpose.

Hatcheling is the final process of dressing, and consists in drawing the scutched fiber through a comb or hatchel consisting of iron teeth about six inches long, one-eighth of an inch in diameter at the lower end and tapering to a point. About ten of these are set a quarter of an inch apart in a hard-wood board, and the fiber is drawn through them until it is freed from all shives and coarse tow, when each handful is slightly twisted, and the product is ready for market.

Breaking and scutching are largely done at present at one operation by a machine which does not take up much more room than an ordinary fanning mill. The bunch of flax is spread upon a table in front of the machine, a set of grooved rollers seize upon the stalks and break them thoroughly by a peculiar motion. Then they pass straightway to the scutchers above the rollers, where they are freed from the shives. The whole operation takes but a little time, and leaves the flax beautiful, clean and shining, without a single tangled fiber. A machine of this kind in each flax-raising district would make a great difference in the profits of the farmers, who would then be able to realize a fair income from the fiber as well as from the seed.

Farm Topics.

WESTERN FARMING.—XV.

W. I. CHAMBERLAIN.

Bonanza Farming.—IV.

In the preceding articles of this series it seemed clear that the mere coldness of the climate need not prevent successful mixed husbandry by "small farmers" in Northern Dakota. The questions of water and fuel, however, still remain to be considered.

Most of the surface and well water is not good. It is too alkaline and brackish to be palatable or healthful for man or beast. The waters of the Red, James and Missouri Rivers, when settled or filtered, are palatable, but that of most of the ponds and creeks is not good, and if wells are dug the surface water usually makes the well brackish. There are good wells, but they are rare and expensive. It seems to me that filtered cistern water will have to come largely into use. Even in Ohio, where brooks and springs abound and wells are easily dug, the filtered rain water is coming more and more into general use. It is, on the whole, if properly managed, the purest and the best. If now all farm buildings have their eaves thoroughly spouted, and very large cisterns are built with good filters, it seems to me enough water can be obtained. All barns and sheds of every kind would have to furnish their share of the water for the stock and, with abundant storage for all the water that falls on all roof surfaces, the supply might answer for all drinking purposes for both man and beast.

The question of fuel is a serious one. There is no wood in large portions of the Territory, except in very limited supply along the few water-courses, and coal has not yet been found, except of a half-formed and inferior character; and the settler may well ask whence the fuel is to come for the long and severe Winters. This problem will be solved in time. Coal in paying quantity and quality will, no doubt, be found within accessible distance, and the timber culture laws, most liberal in their character, will in a few years produce fuel from the fast-growing varieties of trees. But at present coal seems not to be used. I did not at least notice it on sale in the towns, nor being transported on the railways. Wood is found in large quantities back in the timber regions of Minnesota, but the freight of a hundred miles or more is expensive.

The future of even Northern Dakota is, I think, assured. The Territory has enough of the best wheat land in the world to make two States like Ohio, and it is all cleared and ready for the plow, and nearly all of it free from stones. Settlers will surely come in, and will find means of overcoming the difficulties and drawbacks I have mentioned. Men accustomed to cold climates will find nothing alarming in the long Winters. But the facts in the case should be fairly stated, as I have tried to do, and the drawbacks clearly understood, or else disappointment and failure will ensue. For an Ohio and New York farmer who is out of debt or in a fair way of getting out, and who owns an average farm, I should consider it most unwise to think of going West. Ohio has been specially blessed of heaven in soil, climate, products and resources. All the animals, grains, fruits and vegetables of the temperate zone thrive in every county of our fertile State. Our mineral resources are vast. The finest timber covers our hills and plains, and coal underlies a large portion of our area. Stone, for buildings, bridges, foundations, railway ballasting and roads, and gravel for roads are found in almost every school district of the State. We can travel all Winter on hard turnpike gravel roads, instead of being stuck in the mud for four or five months as in some of our fertile Western prairie States. In wheat even Dakota cannot surpass our yield. Certified yields of over 40 bushels per acre are reported to our State Board of Agriculture from nearly every county in the State, and some yields are reported as high as 50 and even 60 bushels per acre. The average from the whole State this year will probably exceed 20 bushels per acre, and our new crop reports will soon show a close approximation to the exact yield. Our State is the very home of the vineyard and the orchard, while stock breeding and feeding, dairying and wool growing thrive. In short, every branch of agriculture and mechanical and manufacturing industry finds its home in Ohio, and our Winters are so mild as not to suspend work.

So, while I should certainly think it unwise for an Ohio farmer in comfortable circumstances to leave this abounding and diversified agricultural prosperity for even the bright promises of the West, but should advise him to stay and develop the resources of his own farm and State by a wiser and more skillful and faithful husbandry, yet for those who have no farms, or for those whose farms are in less favored regions, or for those whose farms are covered by a hopeless debt, Dakota and our other new Western States and Territories have many and decided attractions. One thing, however, should be fairly understood by those who go West to escape debt—viz the cost of starting a Western farm. For very moderate buildings, teams, machinery, implements and necessary household furniture, even on large farms like the Dalrymple and Grandin estates, it costs about $12 per acre *at the outset*, and this does not include land or the live stock, except teams. And for any wheat farm of less than 300 or 400 acres in Dakota, the proper equipment would cost even more per acre, and if stock raising was contemplated, the expense would be still greater. Now, unless our immigrant looks this necessary expense fairly in the face and makes provision for it, he will soon find himself involved in the same hopeless debt he expected to escape. It may as well be fairly understood that it takes considerable skill and capital or great self-denial, or rather all three combined, to make a success of farming at the West or anywhere else.

The great West will furnish happy homes for almost countless millions of our sons and daughters, or for those in less favored lands across the lakes, or the Atlantic: but the varied misfortunes, privations and reverses of a new country will be sure to be found there for a long time, and no one should go who is not prepared to meet them.

Field Crops.

NOTES FROM THE RURAL FARM.

Wheat Notes Continued.

Mold's English Wheats (white and red Winter) at one time promised to yield heavily. The straw was short and heavy, the leaves broad and of a deep green color. The heads looked large and full; but the yield did not fulfill this promise. One plot was manured at the rate of 900 pounds per acre of unleached ashes. The drills were 12 inches apart, the ground hoed once, Oct. 24. This yielded at the rate of 9½ bushels per acre. Another plot was treated in the same way, except that at the rate of 900 pounds of Crocker's "ammoniated bone superphosphate" was sown in lieu of the ashes. This yielded at the rate of 12 1-6 bushels per acre. Upon another plot the seed was sown broadcast at the rate of 40 pounds per acre. This was manured at the rate of 1,800 pounds of the same fertilizer per acre. The yield was at the rate of 11⅓ bushels per acre.

Lost Nation (Spring wheat) was sown September 18, in drills six inches apart, at the rate of one bushel per acre, the plot fertilized with the same ("ammoniated bone superphosphate") concentrated manure, at the rate of 500 pounds per acre. The yield was 10 bushels per acre.

Arnold's Gold Medal was sown broadcast (one bushel per acre) and no fertilizer used. The yield was 20 bushels per acre.

Wyson's Fultzo-Clawson was sown the same as Gold Medal, except that 500 pounds per acre of the same superphosphate were used. The yield was 22⅔ bushels per acre.

Fultz was sown in four different ways:—First, in drills six inches apart, without fertilizers. Yield, 23⅔ bushels. Second, the same, with drills 12 inches apart. Yield, 28 bushels per acre. Third, drills 12 inches apart, seed two inches apart in drills; fertilizer in drills at the rate of 500 pounds per acre. Yield, 26 bushels. Fourth, same as the last, except fertilizer sown broadcast. Yield, 24⅔ bushels.

Defiance; 600 pounds of the same fertilizer

and 600 pounds of unleached ashes. Drills 12 inches apart. Forty pounds of seed sown to acre. Hoed October 20. Yield, 20⅓ bushels. Another plot was treated the same, except that no ashes were used. Yield, 24⅓ bushels.

CHAMPLAIN; forty pounds of seed broadcast, 240 pounds salt, 240 pounds same fertilizer per acre. Yield, 14⅜ bushels. The Defiance and Champlain here referred to were sown for the *first* time as Winter wheats. We mention this lest they might be mistaken for the same varieties which we have sown three years as Winter wheats.

CLAWSON. Four acres of this yielded 102 bushels. We judged from its appearance it would yield 30 or over. The seed was drilled in at the rate of 1¾ bushel per acre. Sixty tons of farm manure were used. The depredations of the army worm, of course, reduced the yield considerably—possibly from 10 to 15 per cent. This, as has already been stated, is our last crop of the popular Clawson. Our main crop for 1881 will be Silver Chaff, of which about five acres have been sown. The field is that upon which 70 bushels per acre of Mold's Oats were harvested the past season. The land is fertile—we gave it a thorough preparation, and shall hope for the best crop of wheat ever raised upon this farm It was sown September 23, and now covers the ground. October 30 we completed our wheat sowings for the season, having sown 77 different varieties. These, we trust, will furnish us with ample material for a special wheat number next Summer, ere it is time to sow for another year.

Other Testimony as to the Value of the White Elephant.

I think the White Elephant a valuable potato. I cut the one sent me into 37 pieces, and found it solid, white and crisp. I planted the pieces in my garden 18 inches apart, 24 inches between the rows. The season was unfavorable for the potato crop on account of the drought, especially at the time of setting. I also had grape-vines and several sorts of berries near the potatoes, which, I consider, took a considerable part of the moisture which the latter should have had. The potato bugs too were plentiful; but I kept them well looked after. The potato vines from every piece came up strong and vigorous. From some of the pieces more than one sprout came up. When they were well up, I took them off and set them out on ground from which I had just taken a crop of peas. The yield from the pieces amounted to one bushel and a half, extra measure (1½), weighing 90 pounds. The product from the sprouts I dug October 20, they being later on account of having been put back by transplanting. I had nearly one bushel, or 54 pounds, some of them weighing over one pound each, making in the aggregate, 2½ bushels by measure, or 144 pounds by weight. I have tried them by boiling, and find the quality first-class. I think them better than the Rose potato. I expect to plant them next season and have much confidence in them.

Morrisville, Pa. ELLWOOD PARSONS.

The Herdsman.

STOCK NOTES.

BY A STOCKMAN.

IF we are getting a good deal of money from Europe for grain, meat and dairy products, we are paying a good deal back again for high-bred stock; and being very liberal in purchases and prices, American buyers help the business very much both in creating a large demand and raising values of such stock. Our buyers and importers of stock are shrewd enough to want the best. Nothing is too good for America, and nothing seems to please an English or Scotch breeder more than to have Americans looking over his stock.

But if Americans have a national failing, it lies in the direction of too great a confidence in their own judgment and the ease with which they are flattered into making mistakes. Just now we are importing heavy horses in large numbers. The latest foreign purchase of such animals was recently made by a Western breeder who brought over nearly a hundred head of French horses in one shipment, and now buyers are scouring Scotland for Clydesdales. It is easy to perceive that big bone and coarse hair are too highly considered by the majority of importers, and that fine bone and light, silky hair on the legs are not in popular favor. This is a mistake. Scores of French horses and Clydesdales of the former kind have been brought over the water for one of the latter. This is explained by the statement of a Scotch breeder who complains that American buyers will not go beyond $1,000 while Australian buyers do not stick at $5,000 if they get the kind that suits them. And so we are getting second-rate animals, good as far as they go, but not the best.

These purchases are not confined to the West. I notice in a Scotch paper that Smiths & Powell, of New York State, have purchased 12 Clydesdales at recent fairs for importation. These are of the most noted blood and breeding in Scotland, and these gentlemen will doubtless soon find their good judgment in going for the best will be its own reward.

It is strange that that excellent type of beef cattle, the Polled Angus, does not become popular with Western breeders. It may be that the practice of stall feeding these cattle and the high feeding to which they are subjected for the purpose of winning prizes have affected their constitution unfavorably. One noted herd of these cattle in Scotland has taken 600 prizes, including 120 gold medals. This goes to show that prize winning is not always accompanied by every excellence and may become a damage. As a contrast, there is the Hereford which is rapidly becoming the most popular breed on the plains. In one week in August, 143 animals of this breed were shipped from Liverpool to New York, and since then another large lot has been shipped to Missouri, and still another lot of 29 to Colorado and some to New Mexico. At this rate it will not be long before the Short-horn will begin to feel the competition. Fashions change, but this is not all fashion.

This is the time when the shepherd needs to be on the alert. The change of season and the falling off of the supply of green food will begin to affect the condition of the flock. The ewes now in lamb are taxed seriously to keep up their condition. A sheep that goes into winter-quarters weak and poor rarely recovers. One that begins the Winter hearty and in full vigor will generally come out in the Spring in excellent condition, with a fine lamb or two at foot. Of all the helpful foods for sheep, linseed-oil meal is the best. It suits their constitution and digestion. It is too bad that nearly all our product of this useful food substance is permitted to go abroad. St. Louis, Chicago and Cleveland are centers of production, while New York and Brooklyn produce a large quantity. It can thus be procured easily in any locality.

Messrs. Read & Pell, the English Commissioners, seem to think that American farmers can never amount to very much as mutton and wool growers. This seems strange to us who remember that the wool crop of California alone equals 50,000 000 pounds, and that Colorado, Dakota, Montana, New Mexico, Arizona and Texas possess pasture grounds sufficient to produce 500,000,000 pounds of wool, and that there is room enough on the tidewater regions of the Atlantic Slope and on the mountain ranges back of it to produce mutton that would more than supply the whole world. All that is required is that farmers should give their attention to it and to get rid of a few millions of useless and destructive curs.

The Horseman.

HORSE NOTES.

Cut Hay Producing Colic in Horses.

SEVERAL months ago we gave instances in the RURAL of this occurring in one of our own horses. The hay was passed through a straw-cutter; Indian meal and bran, half and half, were mixed with it and all then wet with a few quarts of water. Suspecting after a while that this method of feeding was the cause of the colic in the horse, we changed to uncut hay, giving the meal dry and separate from it. This was about two years ago, since when the horse has been perfectly well.

We noticed recently in English journals, the same injurious results from cut hay and meal wet up together and fed to horses, as they eat their ration thus prepared too greedily and quickly to be digested easily. Colic is apt also to follow when a horse comes into a stable hot and very thirsty, and he is also allowed to drink immediately as much cold water as he craves, and is then fed his dry meal followed by uncut hay. Drinking cold water when the horse is very warm also produces founder and other diseases.

Tough Hoofs of Horses.

It is stated that the Arabian horses, so largely used as cavalry in the British army in India, possess such tough hoofs that they rarely require shoeing. In a full-grown horse the hoof becomes as hard as flint, and he can make the most severe marches without injury to his feet.

In ancient times, historians inform us, all horses went unshod, and to be able to do so particular attention had to be given to breed from none except those having the toughest of hoofs. Mr. Story, the American sculptor at Rome, in one of his publications speaks of the Italian horses still retaining this extra toughness of hoof, derived, doubtless, from the old Roman breed.

Brittle and tender feet in horses, it is contended, come from the following neglect in breeding: First, hereditary predisposition; second, imperfect nutrition; third, alternations of moisture and dryness; fourth, diseases of the foot; fifth, faulty shoeing. Horse breeders would do well to consider all these points attentively, and beware not only of them but all other defects of body and limb, external and internal.

Horses Pawing in the Stable.

A light chain is recommended by some to break them of this trick, fastened above the knee to hang down loose, but not long enough to touch the floor. If horses kick, fasten the chain in the same way on the hind leg. If a horse is at all nervous—as such as paw and kick usually are—we should be afraid that the chain would frighten and cause him to kick and paw so much more violently as to jerk it around and seriously injure his legs.

The Swine-Herd.

CHESHIRE OR JEFFERSON CO., N. Y., PIGS.

COL. F. D. CURTIS.

TWENTY years ago the leading breed of hogs exhibited in the State of New York at the State fairs, was the Cheshire. They originated in Jefferson County, N. Y., and filled more pens than all other breeds put together. As a natural consequence they attracted a great deal of attention and, being in the hands of enterprising men, they were always in fine order and showed well. One of the first and most successful breeders was Mr. A. C. Clark, Henderson, Jefferson Co., N. Y; Messrs. Converse, & Huffstater were later, and large breeders. A Mr. Green followed and kept up the breeding and competition for several years. For a number of years we do not recollect seeing at the State fair in New York any exhibitors from Jefferson County. Mr. Davis and one or two other exhibitors still show fine specimens of these hogs, but they reside in other counties.

The proper name for the Cheshires would have been Jefferson County hogs, as there was no doubt of the place where they originated, but there always was a doubt of the Cheshire part of it. It was claimed by some of the later exhibitors and breeders that they descended directly from a pair of Cheshire pigs bought of Mr. Woolford of Albany, N. Y., who, it was said, imported the blood directly from England as a distinct breed. Mr. A. C. Clark never made any such pretensions, but told us that he improved his pigs by crossing them upon the best white hogs he could find. At a Utica State fair about 20 years ago he exhibited the finest specimens of the breed we ever saw, and these were, he said, a cross made by first-premium stock purchased by him at the London, Canada, provincial fair. This stock was probably Yorkshire and the first improvements made in Jefferson County were undoubtedly made in the same way by large Yorkshire pigs imported by Messrs. Hungerford & Brodie, Adams, Jefferson County N. Y. Pig excitement rose high in Jefferson County about those times and several men made it a special business to breed and exhibit Cheshire pigs. They went far and near to exhibit them and at St. Louis pigs of this sort won the pork-packers' premium as the best breed on exhibition. This triumph over the Berkshire, Poland-Chinas and other breeds gave the Cheshires an extensive notice and popularity and led to their introduction into the West.

The Cheshire was a finer breed and better hog than the Chester-Whites and for a time took the lead among the white hogs. The Berkshires and Poland-Chinas have now nearly supplanted them in the West; and in the East the small Yorkshires have led them. For the want of fresh blood to cross upon their stock, the Jefferson County breeders inbred so closely that their stock soon began to deteriorate and established the propensity to lose their tails which dried up and dropped off when the pigs were small. The skin also became very thin and pinkish in color, and they often had so little hair as to be almost hairless. This unfitted them for the sunshine or for Winter, and kept them sore and scabby.

The Cheshires are long in the body and fine-boned with a small amount of offal in proportion to the size and length of the body. They often have very long snouts which naturally go with a long body. The flesh is fine-grained and tender. They would improve any coarse breed. The ears are small and erect, the cheeksfull and the hams round and plump.

The breed with the characteristics of the old Jefferson County stock is likely to become extinct, as it cannot be kept up without new crosses upon the Yorkshires, or other improved white breeds. Care enough was not taken in forming the breed to establish families not closely akin, so that new strains of blood of the same breed might subsequently be obtained. There was so much rivalry among the early breeders that the future welfare of the breed was not considered, and a foundation laid among them which could make it permanent. The Cheshires may be classed as an American breed and a valuable one; and they ought to have been perpetuated with the distinctive name of the Jefferson County breed, with the characteristics which they possessed. If they run out it will be because of the lack of careful breeding and of a good understanding among breeders, looking to definite and permanent results, without which any breed of animals will sooner or later be destroyed.

The Poultry Yard.

SELECTING AN INCUBATOR.

L. S. HARDIN.

I HAVE procured circulars from all the best known and most popular makers of incubators, and, after studying them carefully, I have come to the conclusion that each and all of them were written for the sole purpose of selling machines and not with a view to letting the public know wherein lie the real virtues and shortcomings of each patent. As Mr. Wright in his admirable work on Practical Poultry Keeping, says "It will not do to purchase an incubator, light the lamp, put in the eggs and expect that, provided the lamp be only kept burning, all will go right." While such is the conclusion one is irresistibly driven to after reading most of the circulars on the subject, it is eminently fallacious. The man, and I may say the only man, to succeed with an incubator is one who has made up his mind and will carry out his resolution to give his personal attention to the business and not be disheartened or discouraged with numerous failures. The more chicken knowledge and close attention he brings to bear upon it, the greater will be the measure of success. The machine will not run itself and if one has not the time and patience to master the difficulties it is better not to attempt to raise chickens by artificial means. The only person I would encourage to buy one would be the man who intends carrying on a business in which the incubator is an indispensable factor. There is no fun about it.

While some of the troubles pointed out in circulars are more imaginary than real, others that are almost insurmountable are rarely, if ever, mentioned. For instance, keeping the lamp filled with oil and supplying the battery with blue-stone are pointed out as great labors in the circulars of some machines in which these objections have been avoided or measurably overcome. The man who is too indifferent to the occupation to attend to these small troubles, is the last one to run an incubator. The real trouble comes in where personal judgment, without the enlightening influence of experience, must be used. For instance, with your incubator you receive a mercury gauge and with the machine comes a bottle of dirty stuff that you know, only by its weight, is mercury. Following instructions, you pour this into the gauge; put it in its place and start the lamp; but after heating up the oven to 150 degrees or more, you cannot get the gauge to work, and if you have been foolish enough to put eggs in the oven, they will be all well cooked. The dirt on the mercury has stopped up all the small glass tubes and you must take it out and clean up—and such a job as you will have of it! The instructions say pour the mercury through paper cornucopias until clean. You must make a hundred or more of these to accomplish the end. I discovered a better plan, which was to gently pour the mercury from one white vegetable dish to another, carefully wiping the dish clean each time. This is only one of many troubles you meet with. By the man who has a definite purpose in view and who remembers that there is no business ever carried to a successful issue without trouble and plenty of it, the incubator can be managed and I am satisfied, if properly managed, with a great saving of time, trouble, and money expense over the old-hen plan.

The incubators now on the market may be divided into two classes:—first, simple and troublesome; and, second, intricate and risky. The first class are not expensive and, like the old Egyptian plan, must be regulated by hand. To be sure a very nice lamp or oil stove is used to keep the temperature regular. The plan is based upon the theory that an oil lamp may be made to produce a uniform heat without further attention for 12 hours. There is more theory than fact about this. Having tried it, I will suggest a few of the difficulties I met with. We want a range of heat in the oven from 102 to 104 degress—no more and no less. We watch the lamp until 103 is reached, when we gradually turn down the wick until the heat becomes stationary. At the end of six hours it will be found that the oil in the lamp, or especially that in an oil stove, has become heated and burns much more freely than at first, thus raising the heat in the oven above 104 degrees. As the end of the 12 hours approaches the wick becomes charred and the lamp burns less

freely, the heat in the oven falling below 102 degrees. Then at the other end there is trouble. When the thermometer on the eggs indicates 103 degrees the eggs are not so warm as they will be at the end of six or 12 hours. There being a cool bottom to them lying in damp sand or over a pan of water, the eggs gradually increase their temperature during the whole 12 hours. Then again, the outside temperature may greatly increase or decrease while you sleep. These causes of excess or deficiency of heat, combined or singly, will in the hands of a beginner be almost certain to prove fatal. Every time the thermometer on the eggs reaches 108, if only for a few minutes, some of the chicks will die. Low temperature can be better tolerated, but it weakens and injures the chicks if it occurs often. Possessing, as I do, considerable pluck, I cannot say that I would have the courage to try one of these incubators if it was given to me *gratis*.

The incubators of the next class—those I term intricate and risky—are far more reliable. They are automatic or self-regulating. They work either with the thermostatic bar or mercury gauge, and I believe in some instances with both. With the thermostatic bar I am not familiar, but it is on the same principle as the mercurial gauge. Both are worked with a battery which, crudely speaking, is this:—a glass jar is filled with water. In this we pour two pounds of the sulphate of zinc and one handful of blue-stone. Sheets of copper are placed in the bottom and a bar of zinc on top of them. Wires run from the copper and the zinc through a magnet and through the mercury gauge. A movable bar placed near the magnet opens and shuts the damper that admits hot air from the furnace to the egg oven. When the battery is working the magnet attracts the movable bar and closes the damper; when the latter is not working a small spring, not strong enough to overcome the magnet, opens the damper, admitting warm air to the oven. The mercury gauge starts and stops the battery. The battery can only work when there is a complete "circuit;" that is, when the wires connecting the copper and the zinc in the battery are connected. The mercury in the tube forms part of the wire or circuit. When the oven becomes hot, the mercury expanding moves up the glass tube of the gauge until it touches a small wire which completes the circuit and starts the battery, causing the magnet to attract the movable bar and close the damper. As the oven cools off the mercury drops down the glass tube and breaks the circuit, stopping the battery and allowing the small spring to open the damper and allow more heat to enter the oven. This up-and-down movement is kept up continuously.

A great trouble I have experienced has been to get the mercury to run smoothly up and down this glass tube. If it would only run as smoothly as in ordinary thermometers there would be no trouble; but, unfortunately, my machine is not so nicely made. The tube is open at the top and infinitesimal particles of dust enter the tube, causing the mercury to stick to the sides of the glass, refusing sometimes to go up and at other times to come down. The only escape from accident—and I have had several of them—is to clean out the tube with a broom straw once a week. This is a tedious job, and the danger is that you do not know when the mercury is going to stick.

There are incubators that advertise two batteries, one, I suppose, to open and one to shut the damper; but I have found no trouble in getting my battery to work promptly and strongly, while the expense—a handful of blue-stone once in two weeks—is only nominal. Then it is easy to tell when the battery is getting weak by the noise of the damper closing. The great risk with the second class of incubators is that their perfect working for a week lulls the owner to sleep, and, all of a sudden, something stops to the utter destruction of the eggs and the probable inability of the untrained owner to know how to start it again. The makers of this second class of machines, like the makers of all other machines to work on the farm, charge from a third to a half more than a fair profit would warrant.

ROAD DUST IN THE HEN HOUSE.

The extreme and long-continued heat of this Summer, extending as it did late into the month of September, has been a prolific source of the multiplication of all kinds of vermin on fowls. Those who were either too indifferent to adopt plans for the suppression of the pests, or who are not sufficiently versed in the little convenient tricks of the trade to know how, must suffer pecuniarily, while the poor chickens must bear the burdens upon their innocent backs. It is well known that oil in liberal quantities is sure death to all insects. This is due to the stopping up of the breathing openings along the sides of the insect, like the port holes of a man-of-war. Thus the oil causes death by suffocation. Well fed animals produce oil enough on their bodies, thus keeping the insects on them in moderate subjection, while ill-fed and half-starved animals are sure ultimately to fall a prey to these parasites.

It will thus be seen that well fed fowls have, on their own bodies, a partial means for keeping down their enemies; but there is no doubt that they do much better if aided in this warfare by the skill of their owners. To accomplish this, many use kerosene or crude coal oil, or any kind of cheap oil to brush over the walls of the hen-house and particularly over the perches and about the nests. Oil, however, is a nasty thing to have about, and while it banishes vermin it is very apt to disgust the operator, and, if a female, cause her to give up the whole business or, at best, to put its use off until too late to be of the most service. After using oil, we abandoned it for the cause above stated, and found a better and far more agreeable remedy in road dust, dry ashes and whitewash. For the purpose of being handy, to clean and purify, we made perches, shelves, nests and partitions all movable, and as often as judgment dictated or necessity required, we removed everything and gave the house a good and thorough wetting inside with whitewash. No fears of getting it too thick. Slosh it into all the cracks; but, over and above all, we always keep on hand a goodly supply of road dust, and sift all the ashes on to the heap. This we spread one or two inches deep over the floor of the hen-house. It instantly absorbs all droppings, keeping the air fresh and pure, and every time a hen flies up or down to or from the nests or perches she raises a dust that settles on the perches, nests, etc. This dust may not be immediate death to insects, but it renders life so miserable to them that they immediately vacate the premises. It seems not only to hinder, but effectually to arrest their locomotion, like a horse in a bed of quick-sand. The effect on the chickens is like magic so far as ridding them of lice is concerned.

Now is the time to collect road dust, and with the assistance of the ashes, two or three barrels of the dust will last through the Winter.

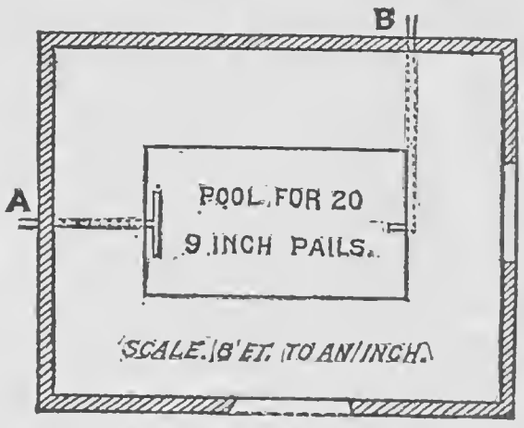
Dairy Husbandry.

THE DAIRY COW. NO 14.

HENRY STEWART.

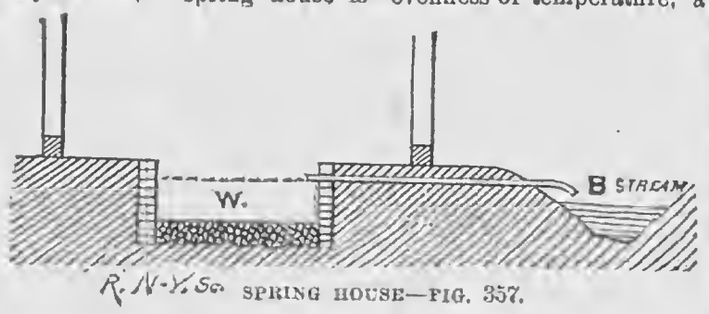
Spring Houses.

The most desirable milk-house is one that



MILK HOUSE—FIG. 355.

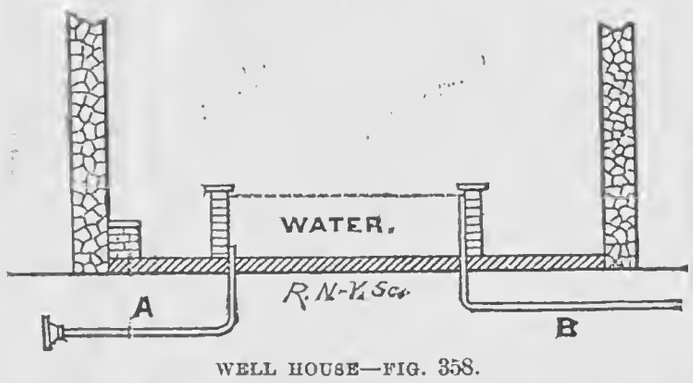
is supplied with a flowing stream of cold spring water. This secures the requisite evenness and lowness of temperature and an advantageous moisture and purity of atmosphere. The best materials for spring houses are, first, stone; then, concrete; and lastly, brick. Wooden spring houses may be acceptable under such circumstances as will avoid dampness; for instance, when water is brought from a distant spring in a pipe laid underground, and made to discharge in a tank excavated or built in the center; or a bank or pool may be constructed upon a spring which fills the reservoir and flows off without wetting the ground. But as one of the important points about a spring house is evenness of temperature, a



SPRING HOUSE—FIG. 357.

solid, heat and cold-proof wall is desirable.

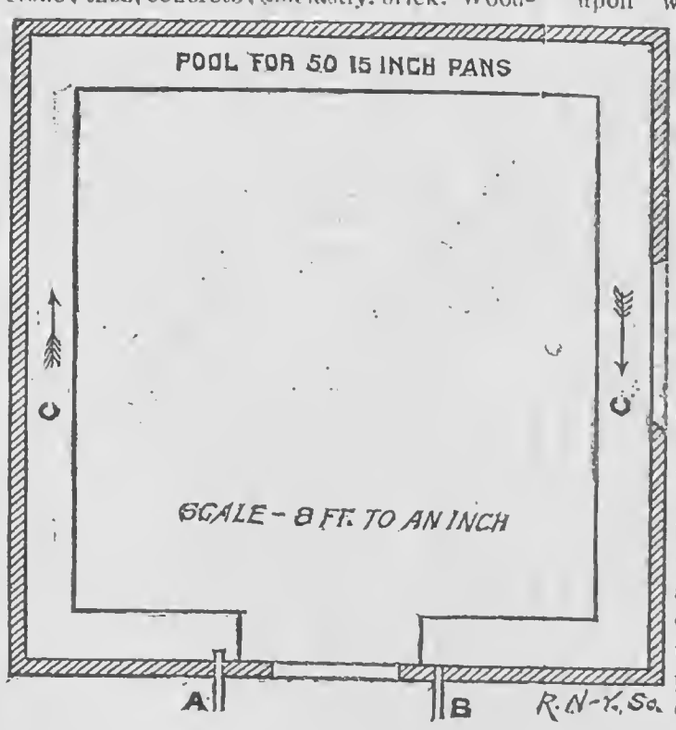
Spring houses may be used for either shallow or deep setting, but the economy of the latter is too obvious to be disregarded. For instance, to set 400 quarts of milk in shallow pans holding eight quarts each, a trough of more than 96 square feet of surface would be required. The two arrangements are compared in the accompanying diagrams—figs. 355-356. Each pool has the same capacity, viz: for 400 quarts of milk or for



WELL HOUSE—FIG. 358.

about 30 cows if the milk is sold; or for about 12 cows if butter is made. The compactness of the house, fig. 355 which has the pool in the center, is evident. Either of these plans is convenient for the system to which it is applied and the construction of the tank and house is the same. In fig. 356, A. is the inlet pipe, B. the outlet and C. shows the pool and the current of the stream.

The house should be roomy. A brick or concrete floor is preferable to any other. The concrete is made of gravel or coal ashes, and mixed with a thin mortar of water lime and sand, in the proportion of one of lime to three of sand. The concrete is laid three inches thick and well rammed down. The pool should be lined with white brick laid in cement, if it is below the surface; if it is raised above the surface, it may be built of brick laid in cement and painted inside. For a handsome pool, the inside may be lined with porcelain tiles and the top of the wall covered with a marble coping. A section of a house provided with such a pool is shown at fig. 358. The house may be sunk two feet below the surface or built on the level of the ground, as may be convenient. The water is brought into the tank by a lead pipe, A, at the bottom and escapes at the water level of the tank, as shown at B. The passage around the tank, is intended to be three feet wide, which gives ample room for brick benches here and there, upon which cream jars, pails or dishes of butter or spare utensils may be placed. The drainage of such a house should be perfect, and good ventilation should be secured by such methods as have been described in previous chapters. The roof should be divided from the lower apartment by a ceiling having two or three feet of space above, by which the heat of the sun beating on the roof, is shut off. The cooler the house is kept, the drier it will be; for the evaporation of the water will be less, and the less the evaporation, the less condensation there will be upon the floor, the walls, and the sides of the tank. A small frame spring house built, as a preliminary test, by the writer, and which had the pool sunk in the ground so as to utilize a spring which existed on the spot, has been found very useful. It cost less than $40 and the pool was large enough to hold 200 quarts of milk. The plan is shown by the diagram fig. 357, in which a section across the house and pool is shown. This house is 12 feet square. The pool was sunk until a boiling spring was reached, and the bottom was paved with flat stones loosely placed, the water rising through the spaces between the stones until it flowed out of a pipe at the top, shown at B, leaving a depth of 18 inches of water in the pool. As the water rises suddenly when several 20 quart pails of milk are put into the pool, the outlet is made of three-inch glazed drain tile, covered with wire gauze as a protection. The drain discharges into a stream close behind the spring house.



MILK HOUSE—FIG. 356.

To cool 200 quarts of milk from 75 or 80 degrees down to 55, requires either considerable time or a good flow of cold water. With a flow of two quarts per minute of water at a temperature of 55 degrees, and an air temperature of 80 degrees, four hours are required to reduce the milk to the temperature of 60 degrees, and the temperature of the milk cannot be reduced as low as that of the water unless the pool is protected by a covering from the air. It may thus be found advisable to provide falling doors to cover the tank when the water supply is not more than two quarts in a minute, which is equal to a flow, without pressure, of a quarter-inch stream of water.

Industrial Implements.

PULLIAM'S PATENT BOLSTER SPRINGS.

These springs are intended only for farm wagons, or such as have bolsters and standards, with cleats on the wagon bed to keep it from sliding backward or forward, and for drays, trucks, hacks, etc. They have been in practical use for over three years, and have given general satisfaction. Among the claims put forth in their behalf are—that they prevent a great deal of wear and tear in every part of the wagon; that their use does away with the necessity for a spring seat; that they convert a common lumber wagon into a comfortable spring wagon, and that they adapt any wagon excellently for the conveyance of fruits, vegetables, etc. The accompanying cut represents three springs as used for extra-heavy loads—usually only two springs are needed. The springs are attached to a cross-board notched at each end, so as to fit on each side of the bolster standard, and placed crosswise on the bolster. The wagon box is to rest on top of the cross-board, but is not to be fastened. Cleats put on each side of the rear bolster standards keep it from sliding. We have frequently seen these springs in use, and can recommend them to our readers.

PULLIAM'S BOLSTER SPRINGS—FIG. 359.

Spreading Out.—Messrs. Skinner & Wood, of Erie, Pa., will occupy their new works, corner of Chestnut and 12th Streets, about December 1st. The main building is two stories high. 150x45 feet. Foundry and boiler shop 80x155 feet. Mr. L. G. Skinner commenced business at Walrath, N. Y., about 1867, and since then has gradually but steadily increased his business until it has reached its present proportions, and the Skinner engine and boiler are known all over the United States. Seven years ago he moved to Erie and took in Mr. Wood as a partner. This year they have built and sold nearly 200 engines; their new works will give them a capacity of 400 a year.

Miscellaneous.

AN EXPERIMENTAL DAIRY FARM AND A HUGE SILO.

The experiments of wealthy men in agriculture and kindred industries are of benefit to the whole farming community. In this way problems of interest to all, but the investigation of which would be too expensive for the ordinary farmer, are solved by the ample means of one. His are the labor, the outlay, the skill and the honor, while the general public reaps most of the reward.

Messrs. Whitman and Burrell, the well-known manufacturers of dairy implements, are the last to add their names to the roll of those who are trying to benefit the agricultural public in this way. They have just started, near Little Falls, in this State, an experimental dairy farm, at which the various questions that are constantly arising in the dairy business will be carefully investigated. As the nucleus of the experiment station a model creamery and a superb cattle barn are already nearly completed.

The latter building is three stories high, 92

feet in length, 36 feet in width and 47 feet from the basement floor to the peak of the roof. It stands on the side of a steep hill from which there is an entrance to each floor.

On the north side of it an enormous silo has been built, at a cost of $1,500, for the preservation of green fodder during Winter. It is 56 feet long, 16 feet wide and 22 feet in interior depth. In making the foundation the soil was removed for three feet below the bottom, and the space filled up with cobble stones, on the top of which rests a stone pavement. The walls are three feet thick and pointed outside and inside. The interior is divided crosswise by a brick partition 20 inches thick, grouted, like the whole interior, with Portland cement, thus forming two silos. To fill these, eight acres of a species of Southern yellow corn were sowed in drills 14 inches apart, about June 10. It was cut about September 10, when the ears were still in the milk. The stalks were nearly as large as those of the Blount Corn, averaging 12½ feet high and weighing from four to five and a half pounds each. The silos are at present only half full, though they contain 600 loads of fodder corn. In filling them a cutting machine, run by steam power, was placed on an opening high up in the side of each silo at the level at which the corn was delivered, the delivery end of the machine projecting over the silo, so that as fast as the stalks were cut they dropped to the bottom, where three men were kept busy distributing and trampling them down. It took four days to fill one silo, and three the other. Each silo is covered with boards 16 feet long, tongued and grooved together in sections three and a half feet wide. These are covered with planks laid across to bind them together, and the whole weighed down with 50 tons of stone for each silo. This enormous superincumbent weight, compressing the contents into a solid mass, has already caused a shrinkage of several feet since the silos were filled. These are now hermetically closed and will not be opened until the first of December.

Zinc Plant Labels.

From several articles going the rounds of newspapers I notice much is said of the excellence of zinc labels for fruit trees, as though they were of recent use. By reference to the volumes of the Horticulturist of A. J. Downing, published some 30 years ago, it will be found that I had used zinc labels, written upon with the black lead pencil, for many years before. A chemical ink had been used for this purpose before that time, but this not being always at hand, I occasionally wrote without it, and soon found that the writing became indestructible, the plumbago being so, while the zinc corroded and wore away, thus making the inscription permanent. So much for the history and application of the thing of which I have had at least forty years' experience.

S. W. JOHNSON, Director.

BRIEFLETS.

If the age of men were to be reckoned only by hours and days well spent most of us would be in our infancy—some of us not yet born. . . . . We have received a sample of excellent sugar made by our occasional contributor, "Hector Bertram" of Corning, N. Y., from Early Amber Cane. His accompanying letter, which we intended to publish, was lost. . . . . Mr. H. B. Ellwanger, writing of peaches to the London Garden, says that Alexander and Amsden are so much alike that one will answer for the other. They ripen a week before Early Beatrice, the Alexander averaging the larger; —the Amsden being a trifle better in quality. Like their parent, Hale's Early, they are semi-clings, juicy, large and of high flavor. Waterloo, judging from the fruit of the original tree, averages larger and earlier. . . . . Early Beatrice and Early Louise are of poor quality. Early Rivers ripens within a day or so of Louise and is a superb sort, the best in flavor of any Mr. Rivers has raised. Cooledge's Favorite is one of the most desirable varieties for any purpose, that we have. Scarcely any other sort combines in equal measure the qualities of hardiness, productiveness and high flavor. . . . . Mr. Ellwanger deems Crawford's Early and Crawford's Late our most popular yellow-fleshed market varieties. . . . . We should like to make our special CORN NUMBER worth from $100 to $5,000 to every subscriber. It will be the first number in January. All of our writers, all of our subscribers are solicited to contribute *any* valuable information they may be possessed of in relation to corn. . . . . The vintage of California is now pretty well ascertained to be the largest ever produced in that State. It is estimated at as high as fourteen million gallons. . . . . Mr Conrad Wilson issues this month a double number of his Business Farmer and Station Record. It has been somewhat delayed by Mr. Wilson's sudden and severe sickness; but it is a grand number and we trust Mr. Wilson may long carry on his good work without interruption and with all the zest and earnestness that characterize his present work. . . . . Robert Douglas and Sons, of Waukegan, Ill., speak of the ailanthus tree as follows: "It may be planted in every part of the United States south of the 40th parallel, in the very poorest soil and most exposed situations. It will grow with great rapidity while young. Produces timber of great value for fuel or cabinet work. It should not, on account of the disagreeable odor of the male flowers, be planted near dwellings. It is especially recommended for poor, dry, barren soils." . . . . . They recommend the Red Cedar (Juniperus Virginiana) for the plains of Kansas and Nebraska, where, in fact, it is the only indigenous tree. We think that enough has not been said in favor of this tree as a hedge plant. It will bear cutting back as well as the arborvitæ, and is more hardy. . . . . It is suggestive that, notwithstanding the fact that many die of starvation in India, the poppy in many parts of the country displaces the cereals. . . . . Professor Cook finds, from experiments begun in 1872 and continued every year since, that sulphate of ammonia has no beneficial effects upon corn, but that, on the contrary, both corn and stalks are diminished in weight by its use. He finds that the use of muriate of potash has been beneficial to both corn and stalks and this has been the case so many times that he considers that it establishes the fact that corn is a potash plant.

CATALOGUES, ETC., RECEIVED.

MANUAL OF CATTLE FEEDING, by Henry P. Armsby, Ph. D., Chemist of the Connecticut Agricultural Experiment Station; published, by John Wiley & Sons, 15 Astor Place, N. Y. This handsome, cloth-bound volume of 525 pages goes a great way towards filling a great desideratum in American agricultural literature. Investigation into the laws which form the basis of the rational feeding of live stock has been industriously carried on of late years, and many important advances have been made, especially in Germany, particularly within the last 20 years; but unfortunately the ascertained results have been almost inaccessible to American readers, as only fragments of the works containing them have been translated, chiefly for the columns of agricultural papers. The present work draws largely upon the works of the celebrated German scientist, Wolff, but Kuhn's tables of the composition and digestibility of feeding stuffs have been substituted for those of the former expert, because tables arranged on the latter's plan are thought preferable to those containing simple averages, as do Wolff's. The author, however, has not been content to confine himself to mere translations of foreign works, valuable as these would have been; but he has made many additions and given numerous new illustrations. Nor has he merely stated the results, for he has also indicated the processes by which these results have been reached, and the degree of certainty attached to them, as well as pointed out the direction in which our knowledge is still deficient. The work is written and arranged in a form intelligible to ordinary readers who are willing to bestow on it the fair share of attention and study without which no valuable information can be obtained. We strongly recommend it to all our readers who desire to avail themselves of the profitable results of the special studies of many careful scientists who have spent years in investigating the subject of economical stock feeding.

ANNUAL REPORT of the Michigan State Board of Agriculture for 1879. This report is very full in Farmers' Institute reports and miscellaneous papers covering all the important features of State agriculture, and showing that the society is in a very flourishing condition and doing the most efficient service.

NORTH AMERICAN AYRSHIRE REGISTER, VOL. IV., This handsome volume of 176 pages, 8 mo., by Dr. E. Lewis Sturtevant, South Framingham, Mass., contains the pedigrees, traced to importations, of 232 bulls and 482 cows of the Ayrshire breed, together with some additions to, and corrections of, the contents of former volumes, and a list of the Ayrshire breeders in this country.

QUARTERLY Report of Statistics, Treasury Department, relative to imports, exports, immigration and navigation of the U. S. for three months ended June 30, 1880. Also containing other statistics relative to the trade and industry of the country.

SPECIMEN BOOK OF 100 ARCHITECTURAL DESIGNS, showing plans, elevations and views of suburban houses, villas, sea-side and camp-ground cottages, homesteads, churches and public buildings by Bicknell & Co., 194 Broadway, N. Y.

REPORT of the Entomologist of the United States Department of Agriculture for 1879 by J. Henry Comstock. Illustrated. This is full of practical, timely information and reflects much credit upon Prof. Comstock.

WHAT OTHERS SAY.

SUPERABUNDANCE OF APPLES.—We wish to suggest for the consolation of orchardists who are inclined to murmur at the superabundant crop of apples this year, that already there is evidence that this superabundance will be overruled for good to American fruit-growers. Apples are being shipped to Europe this Fall in greater quantities than ever before, and as they are cheaper than ever, they will advertise themselves thoroughly and successfuly, and we shall hereafter expect a foreign demand such as we have not known in the past. So Mr. Hyde expresses himself in the N. Y. Times, agreeing with our "Brevily" in the RURAL of October 9.

DIGGING POTATOES.—A Maine farmer says in the N. Y. Herald that he paid his men $1 25 per day for digging and pitting potatoes, which cost six cents per bushel. He told two of the men he would give them five cents per bushel if they would do the work. They took the job and went to work, and dug and pitted 100 bushels per day, and went home sometimes by four o'clock in the afternoon. The farmer saved one cent per bushel, or $1 per day; the men doubled their wages.

SUGAR FROM AMBER SUGAR CANE.—Mr. E. M. Potter, of Kalamazoo, Mich., sends the Telegraph of that place a sample of sirup from the Amber Sugar Cane and the following statement of the manner in which he grew the cane and had it made:

May 10—Planted about 1-5 of an acre in eight rows, 3 1-2x2 1-2 feet, 20 rods long. May 10—Hoed and thinned to four to five stalks in a hill. June—Cultivated and hoed again; afterwards cultivated two or three times. Sept. 16—Stripped off leaves and cut off seed-top. Sept. 17—Cut and hauled 68 bundles in two loads to Anderson's mill one mile west of Comstock and corded it up, piling each tier of bundles crosswise. It was made Sept 22, and brought home Sept. 27, 32 gallons of molasses equal to the best New Orleans. Paid 20 cents per gallon for making. We find the above in the Michigan Farmer.

EFFECT OF REMOVING POTATO BLOSSOMS. As the potato plant is propagated by its tuber after the manner of a bud or cutting, the effort made by the plant to produce its flowers and seeds must be a waste of power, which detracts from the desired crop—the tubers. We (Mark Lane Express) know an instance in which a six-acre field of potatoes was tested to show the truth of this postulate; three rows had the blossoms cut off and three rows were left intact, alternately all over the field, and the produce of the rows which had been deprived of the flowers showed a very marked increase over that of the rows which had not been so treated.

ADORNING SCHOOL GROUNDS.—If parents and school trustees cannot be induced to regard common decency in the matter, says Mr. Thomas, it would be well to procure the passage of a law that no district should receive public money, that did not have at least a dozen thrifty shade or evergreen trees on the school grounds. These trees would not cost ten dollars. Agricultural and horticultural societies should take hold of the the matter. It would be more important than giving premiums for fat pigs and big apples.

AMERICAN ARBOR VITÆ—THUYA OCCIDENTALIS.—We find the following in a catalogue just received from Robert Douglas & Sons, of Waukegan, Ill. Specimens of the above were sent to the Rural Grounds two years ago where we have found them to be as described below. Earlier reference has not been made to them in these columns for the reason that we were not informed as to when they would be offered for sale. The Golden Juniper referred to in the last paragraph is especially attractive and has not during the two years been in the least harmed by frosts or heat:

"We take great pleasure in introducing to the trade for the first time the following varieties of Thuya occidentalis originated on our own grounds:

LITTLE GEM.—One of our own seedlings, most dwarf and compact growth ever introduced. The original plant is over ten years old, eight inches high, and 45 inches in circumference, a beautiful dark green. It is by far the finest arbor-vitæ for edging we have ever seen.

WHITE-TIPPED.—This is one of the most beautiful of our sports of which we have about 15 different varieties. The ends of the branches are tipped with white from the last of June until the following Spring. During the growing Season the variegation is not as bright as it is after it has finished its growth, when it is very handsome, as the dark green color shows off the white tips to good advantage.

A GOLDEN THUYA OCCIDENTALIS that holds its golden color nine months in the year, during which time it is very conspicuous.

A THUYA OCCIDENTALIS, pyramidal in form and with very distinct foliage, somewhat resembling a retinospora.

Next year we will introduce a very fine Golden Juniper. It is one of the best plants for ornamental rockwork we ever saw. It is as bright as the Golden Yew, and retains its color nearly or quite all the season."

EUROPEAN LARCH.—Robert Douglas of Waukegan, Ill., says of this that it succeeds best planted on gravelly upland, anywhere north of the 40th parallel; grows rapidly even on thin, poor soils. Timber durable and valuable for ties, posts, etc. If planted on very rich or undrained soils, the timber is said to be of little value. Must be planted *very early* in the Spring.

WHITE ASH.—This they remark may be planted in rich, strong soil, in any portion of the United States north of the 38th parallel. Wood unequaled for all purposes requiring strength, elasticity and lightness. It is becoming scarce, and is in great demand.

HARDY CATALPA, C. speciosa, may be planted in rich, strong soil, anywhere south of the 42d parallel, but has not been tested in New England. Is especially recommended for the Western prairies, where the growth is exceedingly rapid. Wood unequaled for durability, and in great demand for ties, posts, etc.; also valuable for cabinet work. Especially recommended.

WILD BLACK CHERRY, Prunus serotina, may be planted in any part of the United States, in a dry soil. Grows rapidly. Wood in great demand for cabinet making.

SCOTCH PINE.—Will grow rapidly in the poorest soil and most exposed situation, where it will make better timber than on too rich soil.

ACCLIMATING CATTLE IN TEXAS.—One of the greatest obstacles to the improvement of the vast herds of cattle on the Texas prairies by crossing the cows with bulls of the Short-horn, Hereford, Polled Angus or other desirable breeds, lies in the difficulty of acclimating these. The great majority of cattle imported from the North or Europe into the Lone Star State soon succumb to the Texas fever; nor is there any known system of treatment by which the animals can be guarded against its attacks. In the National Live-Stock Journal for October, a Texan correspondent gives his experience with regard to 30 head of cattle he imported from Kentucky in '79. These consisted of 20 Short-horn heifer calves, five Short-horn bull calves, two yearling Short-horn heifers and three Jersey heifers. On their arrival in thrifty condition on December 13, they were put in a lot where no other cattle had been for several months, and carefully rationed on crushed corn, ground oats and cotton seed with hay and oat straw as rough feed, the feed being changed slightly several times as judgment directed until March 20, when, the prairie grass being good, the heifers were turned out.

By April 16, it was found that several of them had the fever, and between that date and the 30th, in spite of the most approved remedies, he lost six calves, when treatment was discontinued as useless, except the use of the syringe to keep the bowels open. Of the 25 calves, 23 were sick, all at about the same time, and 11 died of the fever, among which were four of the five bulls. Four of the five heifers proved to be with calf; all had the fever; and three of them died; with one exception all that passed bloody urine died. The calves received the best attention, were sheltered from sun and "northers," yet his loss was as heavy as that of those who turned their thoroughbreds, on their arrival, among Texan steers to shift for themselves. In 1868 Prof. Gamgee said of the Texas fever:— "So far as treatment is concerned the whole history is a record of failure," and the saying is true yet.

INOCULATION FOR PLEURO-PNEUMONIA.—It has sometimes been said that inoculation should be practiced in this country as a protection against fatal results from pleuro-pneumonia among our herds. The number of animals affected by this disease among us, however, is so small that the best preventive is totally to stamp out the plague by slaughtering the diseased animals. As in the case of small pox, inoculation for pleuro-pneumonia produces a mild and manageable form of the malady in the animal operated upon; but the disease can be spread from such subjects, and therefore, however advisable it may be where a large number of cattle are affected, as in some districts in Germany and Russia, the practice is highly objectionable here. Even in Europe there is a growing opposition to the practice. The veterinary editor of the North British Agriculturist, in commenting upon its advantages and disadvantages, says:—

"Even with such skillful and experienced operators as Mr. Rutherford and Mr. Watson, and notwithstanding the use of properly selected virus, two or three per cent. of the cows operated upon lose their tails. A certain smaller proportion are affected with blood-poisoning, and a few actually die. From causes not yet explained, some animals operated on are not protected against the disease. Still another objection has been urged to inoculation. The artificially produced disorder may generate virus which, it is stated, may suffice to set up the unmodified disease in all its contagious activity. It is only amongst herds where the disease has already appeared, or amongst animals believed to have been exposed to contaglon, that inoculation can be justified." And even in such cases it cannot be justified in this country.

BREEDS OF CATTLE FOR THE WESTERN PLAINS.—The problem which of our recognized breeds of cattle are the best adapted both for making beef and improving the herds on our vast Western ranges, is in course of solution by actual experiment. A close and shrewd observer of the results already noticeable is Mr. J. W. Clarke, of Iowa, author of a recent work entitled "Perplexing Cattle Problems." In a chapter on the above subject he intimates his opinion that the Devon and Hereford are better adapted for the plains than the Short-horn, for the reasons briefly summarized here. Both these breeds are more active, muscular and capable of more exertion than the Short-horn. In early Spring, when stock are weakest, the tussocks of bunch-grass on the ranges are more or less widely scattered, so that when first turned out cattle have need of much walking and muscular exertion to pick up a living, and here the Devon and Hereford excel the Short-horn. Owing to the bleak character of the country, the absence of timber, the frequency of keen, often-changing winds, and the long distances to water and to the corrals, muscular, vigorous, active and enduring cattle are better adapted to it than light-muscled, thin-skinned animals like the Short-horn, which, although excellent fat-framers with abundant feed, seasonable shelter and little exertion, are not so well adapted to the hardships of the Western country as the more muscular and hardy breeds.

ON the grounds of prepotency, too, there is no breed the bulls belonging to which impress their special characteristics more powerfully on their progeny than do the Herefords and Devons, both of which are older breeds than the Short-horn. Then again, the Herefords, with their thick skins and vigorous circulation, can endure exposure better without loss of flesh; while the Devons—the perfection of muscular fullness for beef—are well fitted to supply vital growth and enduring vigor in forming, by crossing on good native stock, a nucleus of a middle-sized, active breed specially adapted to the conditions of the Western plains. Moreover, the cattle on the Western ranges are almost exclusively grass-fed, and the grass-fed Hereford supplies beef which is usually quoted higher than that of the Short-horn in the English markets, while Devon beef brings there top prices except in competition with the small supply furnished by the West Highlanders.

Everywhere.

RURAL SPECIAL REPORTS.

ARKANSAS, Little Rock, Pulaski Co.—The cotton crop is not so large as expected, owing to ball-worm and too much rain in September; but the crop is a good one nevertheless, and farmers are jubilant. Cotton is coming in very fast and selling at good prices, 10 and 10¼ cents per pound. I think the crop will exceed that of '79, more ground having been planted. Little Rock has a very large cotton-seed oil mill, and another one was built during the Summer across the river in Argenta. W. G.

ARKANSAS, Greenwood, Sebastian Co., Oct. 20.—We have had but little rain this Fall, and no signs of frost yet. The weather is just splendid for picking cotton. The crop this this season is hardly up to the usual average. Prices rule above 10 cents, therefore farmers are not discouraged. Other crops have turned out unusually fair. We planted Beauty of Hebron Potatoes August 3d for a second crop, and in 60 days they had matured sufficiently for table use, and will yield a profitable crop. R. R.

KY., Forks of the Elkhorn, Franklin Co. Oct. 19.—We have had dry weather for the last six weeks. All small grain has been put in—quite a large acreage. Our crop of apples for the Winter will be slim—hardly any in the county. I won the first premium at our county fair with beets grown from the RURAL seed. A. N. B.

MINN., Howard Lake, Wright Co., Oct. 23.—Wheat is now bringing 84 cents per bushel at this point, and one of the elevator men thinks both elevators have taken in about 60,000 bushels this Fall. It averages better than for years before—much less of No. 2 and scarcely any No. 3. One man raised 72 bushels of oats per acre on a five-acre field. Wheat is said to average about 23 bushels to the acre, although some goes as high as 30 bushels. Potatoes bring only a low price here, but they are being shipped South by the car load, and are good—price 15 to 25 cents. Very few States can grow such fine, good-tasting, mealy potatoes as Minnesota. Butter is of all prices almost, the best bringing 25 cents per pound. Hay abundant and better than usual. Our great snow storm of the 16th inst. astonished even old settlers. 'Tis said the fall was greater by some inches than at any one time last Winter. Nearly all gone now. S. A. M.

MO., Pleasant Mount, Miller Co., Oct. 20.—New wheat is coming up nicely. We have had just enough rain to make it sprout quickly after sowing. A few have not yet finished putting it in, although it is getting quite late. Corn is being gathered, and a large quantity is being fed out to fattening hogs, which are up to the present time doing first-rate. There is a large number of hogs being fattened for market, prices for which are now good, being about four dollars per 100 pounds for gross weight. We need more rain, especially for stock water. N. J. S.

NEBRASKA, St. James, Cedar Co., Oct. 21.—The weather is very dry. Corn was damaged somewhat by drought—late corn only half a crop; early corn, first-rate. Wheat was splendid in quality of grain, but thin on the ground—from 10 to 15 bushels per acre. Potatoes, good; oats, heavy; barley, do. Improvements are being made—but slowly. A genuine blizzard began here on October 15 and lasted until the 17th. It is snowing again to-day—very hard on stock, as the ground is not frozen and the snow is very damp and wet. This is very unseasonable weather here, and farmers are not prepared for it—sheds out of repair and corn not gathered. I. N. S.

N. Y., Fluvanna, Chautauqua Co., Oct., 20.—The weather is delightful, the mercury ranging from 65 to 82°. Winter wheat is looking exceedingly well. A larger breadth is sown than usual. Potatoes are a short crop; worth 40c. per bushel. Corn is giving a good yield of fine quality. Hay sells readily at $12 per ton. Butter fluctuates from 23 to 27 cents. It is a little too dry for pastures. The fruit crop is abundant and therefore can be procured at low figures. Pork is a quick sale at six and a half cents. Buckwheat is coming in a little light. Poultry is plentiful at high figures. Chickens 8c. live; turkeys, 13 to 14c. dressed. H. A. W.

OHIO, Camden, Preble Co., Oct. 18.—We have had a little rain, which has brightened up our wheat and will probably stop the fly which was working on that sown early. Our corn is a fair crop and the dry weather has been fine for it to mature well. My mangolds turned out magnificent: yielded at the rate of 1,250 bushels to the acre, 60 pounds to the bushel. I have 20 pounds of cleaned cow-peas. They covered the ground from eight to twelve feet. Thinner land would have yielded more peas and not so much vine, I think. Our county fair closed on the 1st inst. There was a fine display of horses, hogs and sheep. The cattle show was not as large as usual, but the quality of those exhibited was much better than on former years. The display of fruit, grain and vegetables was magnificent. The floral show, too, was very fine, and so were those of poultry and machinery. W. M.

PA., Nittany, Center Co., Oct. 22.—We are having beautiful Fall weather. Farmers are busy husking corn. Corn is a good crop throughout this county, among the mountains of the old Keystone State. Wheat badly frozen; much of it shrunk in the grain and will be of poor quality. The hay crop was short and hay will be scarce before Spring. It is now worth $15 to $20 per ton. Wheat in the ground is growing nicely. Some is turning yellow, however, being injured by something at the root. The season has been remarkably dry. We have not had enough rain all Summer to raise water in the streams. J. H. B

PA., New Alexandria, Westmoreland Co., Oct. 23.—With Golden Ovoid Mangels, Blount's Prolific Corn and Rural Branching Sorghum, we have from the RURAL, in addition to a first-class paper, advantages never before offered. J. W. P.

RHODE ISLAND, Providence, Oct. 18.—From the seed of the Ovoid Mangel received from the RURAL in the Spring, I have just carried to the cellar one large cart load with side boards on—16 to 18 bushels. One of them weighed, unwashed, 18¾ pounds, (!) though it was closely trimmed. About half a dozen of the beets turned moldy in the field. E. F.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Honey Locusts.

A Subscriber — address mislaid, says last Spring he planted some Honey Locust seed for the purpose of raising hedge plants. On examining the plants this Fall he finds very few which have any thorns, and he asks, 1, why so many plants are without thorns; will they be likely to have thorns in a year or two; would it be well to leave the thornless plants in the nursery until they are a couple of years old on the chance that thorns might appear; 2, would grape cuttings be likely to grow after a considerable trip by mail.

ANS.—There is a thornless variety of the Honey Locust, seeds of which probably you had sown. Probably they will never have thorns. In any case, no harm would be effected by leaving them in the nursery for two years before removing them to the hedge row. 2. Yes. It cut after the fall of the leaf and the wood is well ripened, they may be preserved in sand until next Summer.

The Voorhis Watermelon.

W. H. B. Afton, Ia., says: "Of two packets of seed sent out through the Rural Free Seed Distribution there was but one vine that produced what was thought to be the Voorhis melon. The rest of the vines produced small, round dark-green melons, and occasionally one which was marked alternately with light and dark-green stripes. The seeds of the supposed-to-be Voorhis melon were saved and planted last Spring and the product was quite a variety of melons, but they were all worthless. Will some one please explain the cause of such variation among melons?

ANS.—The Voorhis is a dark-green melon, never *very* large, but exceedingly sweet in favorable seasons. In this climate it is impossible to produce fine watermelons without rich soil and good cultivation, no matter how good the variety.

Miscellaneous.

H. K., Chebanse, Ill., asks in how many years black Damson plum pits become bearing trees, if put in now, and whether the seedlings would require grafting. 2. He has some Concord grapes, seven years old, that, owing to the severe drought probably, have made very little wood growth this season, and he inquires whether they should be cut back this year. 3, He set out a Delaware and Martha grape last Spring, which have made a growth of five and four feet respectively, and he asks whether it would be right to let them bear a bunch each next year.

ANS.—1, Yes; probably they would need grafting. Seedlings may bear in a few years—they may not in many. 2, The Concord, whether the season be wet or dry, is always a vigorous grower. No doubt the roots are injured from some cause. Cut it back severely and dress the surface of the ground liberally with stable manure, wood-ashes and bone. Fork this in to the depth of five or six inches. The grape-vine bears fruit only upon canes of the previous year's growth. In cutting back severely, therefore, you need not look for fruit next season. 3, Ordinarily, yes. But we doubt if they *will* bear having made but a poor growth.

A. W., Everett, Pa., asks, 1, our opinion of the Albany Corn and Seed Planter, and what drill do we use in planting corn; 2, would we vary our Free Seed Distribution so as to let him have a package of our Blount Corn with the White Elephant instead of other seeds, with which he may not be able to succeed.

ANS.—1. The Albany Corn and Seed Planter has an excellent reputation. We have not tried it. In our planting we used the Hoosier Corn Drill (see premium list) which was sent to us for trial. 2. We have saved only a small quantity of Blount's Corn for seed—and this with a view of improving it. The ears have been selected not from those stalks which bore the greatest number of ears necessarily, but from the most prolific stalks bearing such ears as are freest from the characteristic imperfections of this variety. We would be greatly pleased to vary our Distributions to suit individual friends—but really it is impracticable.

C. N. G., Poughkeepsie, N. Y., among several queries, asks if we have any set days at the Rural Farm and how should visitors get there from New York. He wants to see our crop of Blount's Corn.

ANS.—We are now fast closing our work at the Rural Farm (Oct. 25). Nearly all the work that needs our personal attention is completed and the farm will soon be left in the hands of the farm manager and his family. Before this reaches the eye of our friend, Blount's corn will, for the most part at least, have been husked. The Long Island R. R. (taking boat at the foot of Pine Street, James Slip or 34th Street) goes direct to Pearsall's Corners or Hewlett's Station, either of which is within a mile and a half of the farm. The other questions will be answered later.

H. B. K., no address, asks, 1, how to plant Horse Chestnuts; 2, how should Water Chestnuts be treated to make them sprout: 3, why do potatoes grow snagged, the seed having been smooth; 4, which will bear the sooner, grape-vines started from cuttings or from seed.

1. Place the seed in sand in a box as soon as ripe removing the outer burr and bury the box. Plant in the Spring. 2. We do not know what Water Chestnuts are. 3 Drought, too deep planting, second growth, the unequal pressure of the soil, stones, etc. 4 From cuttings. Seeds *may* fruit the third year—they *may* not in ten. Cuttings should fruit the third year usually.

A. J. B., Clarksfield, O., being very well pleased with the results from the seeds sent out by the RURAL last season, asks, where he could get a larger quantity to plant next Spring.

ANS.—In due time we shall notice the Spring catalogues of seedsmen. Wherever, as heretofore, we find seeds which the RURAL has introduced or disseminated, therein offered, mention is made of the fact as an answer to many inquiries we are all the time receiving similar to the above.

R. G. K., Collyer, Kan., referring to a late article in the RURAL on nut-bearing trees, asks where can he get fresh seed of the English walnut—the Report of the Department of Agriculture for '78 says this variety will thrive in that section.

ANS.—We find them announced in the catalogue of James M. Thorburn & Co., 17 John Street, N. Y.—40 cents per pound.

J. H., Hartford Co., Conn., asks, 1, where can he get Chester County Mammoth Corn; 2, what other large varieties of corn are there.

ANS.—1. All the prominent seedsmen will sell it for another year. 2. Compton's Yellow Flint; White Horse-Tooth (Southern White); King Philip (eight-rowed); Dutton Yellow Flint, 10-rowed.

J. W. K., New Alexandria, Pa., asks where can he get seed of the Golden Ovoid Mangel to plant a half acre next Spring.

ANS.—The Ovoid Mangels will no doubt be offered by seedsmen generally another season. We shall call special attention to such items in the Spring catalogues sent to us for notice.

D. J. A., Moore's Store, Va., asks whether Lost Nation Wheat is a bearded or a smooth sort; is it white or red; does it yield well and where could he get a small quantity for seed.

ANS.—Smooth, white. Yes, it yields well in the Eastern States and Canada as a Spring sort. Ask Dr. Hoskins, Newport, Vt.

N. A. C. Oshkosh, Wis., asks whether the Clematis Jackmanii and the Dutchman's Pipe are hardy.

ANS.—Yes; both are hardy.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT E. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, NOV. 6, 1880.

Now that the end of 1880 draws near, let us say to those of our subsrcibers who do not wish to renew for another year, that they need not trouble themselves to write us to that effect. All names pass off from our subscription list when the subscription term expires. This is our invariable rule. The NUMBER on the printed address of every subscriber is a constant reminder of the end of the subscription term.

THE fact is that canned tomatoes are just as good in every way as fresh tomatoes. Properly cooked they cannot be distinguished. It matters, in point of fact, very little which is the earliest tomato—whether the crop is great or small it is always greater than the demand—or what are trifling differences between varieties. Canning establishments prefer large, smooth tomatoes—and herein the requisites for home use and the market agree.

EVERY one admits that in the wind power of the country blowing to waste, is a source of all the power that could be wished, could it be curbed or harnessed into service. The windmill is the best and only thing yet for utilizing this power, but supposing a man, instead of a dam and pipe and turbine wheel should simply set a float wheel out in midstream and depend upon the natural supply of water, sometimes less and sometimes a flood, what would be said of him? Is there no means by which the winds may be directed to a certain purpose? The field is as promising a one as many others were when inventors and discoverers began their labors.

KEEP ACCOUNTS and know precisely what is done, and is doing, and how the business of the farm is paying, in what particular it is paying, and where it is losing. Farming *does* pay. It is the most profitable business in the world. The loose and careless manner in which it is generally carried on would utterly wreck any less profitable business. There was once a man who made certain attachments for looms known as "pickers," and prepared the raw hide from which they were made himself. But he thought it was a more cleanly and better business to buy the hides and merely cut them up and make the pickers. So he bought the hides from a neighbor, and the first year he was overwhelmed with debt and sold out, and his neighbor became rich by curing hides. The unfortunate man made money so fast before, that he never troubled himself how it was made, and only learned too late that one part of his business was profitable and the other was not; but then he had given over to his neighbor the profits and kept the losses for himself. It is much the same with farming, for no one can tell where he is losing or making money, without accounts. Just now is a seasonable time to consider this matter and to begin a new and more reasonable and safe system.

TO INCREASE THE PROFITS OF THE CORN CROP.

WE do not claim that our yields of Blount and Chester are the greatest ever before produced, but that they are the greatest yields produced upon considerable areas and at so little expense.

We do not know what useful information is gained by trials of farm plants on small plots when treated in a way not applicable to ordinary field culture. It is known that at the rate of over 200 bushels of shelled corn per acre has been raised on fractions of an acre, which have been richly manured and hoed and raked as if they were garden plots. Dr. Chamberlain, who took the first prize for Blount's Corn offered by the RURAL, raised at the rate of 190 bushels per acre on a plot 33 feet square. But the plants were treated to liquid manure, and otherwise an amount of labor was given to the plot which cost more than the corn was worth. We do not want to know how much corn, wheat, oats or potatoes can be raised to the acre regardless of cost, but how much we can add to our present yields with less than a proportionate addition to the cost of producing them. Since to ascertain that we may greatly increase the yield of our crops only as the cost of production is increased is of no practical value to the farmer, we must ask, are there simpler, less expensive methods by which we may increase them? That this question may be answered in the affirmative, our late yields of corn are offered in proof, produced as they have been at a cost no greater than that with which ordinary yields of 60 bushels are produced and by a system of planting and cultivation quite different from those adopted by good farmers generally.

COMFORT FOR THE CONQUERED.

WRITING before the settlement of the political struggle what can be read only after its outcome will be known to all, our words here can have no special reference to either party. To the victors, to whichever side they may belong, we would merely counsel moderation in their first hour of exultation; to the vanquished we would offer a few words of consolation. A comparatively small number of them, however, will be downcast because their aspirations for office have been disappointed; for these words have no solace, and if they had a superabundance we would not offer a monosyllable. The depression of the vast bulk, however, will be due to an honest belief that the prosperity of the country, if not ruined, will be at least jeopardized by the success of their opponents. Out upon such a conceit! Which of us is unpatriotic enough to tolerate such a reflection on a republican form of government? Having an abiding faith in the American People, we cannot for a moment imagine that the triumph of either of the great factions whose struggle for supremacy is now agitating the country, can make or mar the prosperity of the nation. That is a blessing the People will always place above partisan success, and woe to the faction which in the time of its sway shall threaten the continuance of that prosperity or check its increase—its day of ascendency will be brief and its return to power long-deferred. If the fear of the Lord and the love of country shall not prompt our rulers to wisely foster the welfare of the nation, the fear of the People and the love of office are pretty sure to restrain them from foolishly injuring its prosperity. Cheer up, then, oh ye down-hearted! The nation is safe, and your day of triumph may come round—four years hence.

FOUR YEARS' RESPITE.

BY the time this shall have met the eyes of our readers the battle at the polls will have decided the issue of the political campaign. The lightning will have flashed the conqueror's name to every corner of the land, and details of the victory alone will be waited for. The prophets on one side will be jubilant at their foresight; those on the other exasperated at the perversity of things in general. The victors will be temporarily wild in the first flush of their triumph at having saved the country; the vanquished momentarily depressed at their having failed to do so. On one side congratulations will be loud on the skill of the leaders and the earnestness of their followers. On the other, recriminations will not be silent on the blunders of the officers and the lukewarmness of the men. The oratorical and editorial "mud-slingers" will have suspended their unworthy work until the next local or national election, and the foul stuff will have already begun to drop readily from the objects of their assault unless a previous smirch of their own formation has given it a congenial sticking place. The rancor and bitterness of party warfare will have begun to subside into the friendly civility of neighborly intercourse. The banners, torches, transparencies and other gaudy paraphernalia of marching turmoil and partisan excitement will be on their ignoble way to the lumber room or junk shop. The wheels of business, having passed safely over the quagmire of a political crisis, will roll with their usual ease along their customary tracks whichever party is roadmaster. The men who, selfishly or disinterestedly, have been for months spending their time in clamorously attending to the affairs of the nation, will have begun to take thought of quietly attending to their own. Yes, when our friends shall read this page the victory will have been won, "the country saved" and common sense and routine will have begun to resume sway.

A GLANCE AT OUR COMPETITORS.

SOME idea of who our chief competitors are in the European wheat markets may be formed from the following statement of the amount of wheat on passage to the United Kingdom on Oct. 14, '80. The heaviest amount on the way was from California and Oregon—3,912,000 bushels. It must be remembered, however, that the voyage from the Pacific Slope to Great Britain, like those from some of the other places mentioned below, is very long, and that wheat is nearly always transported from such distant points in sailing vessels, so that the amounts at sea at any one time from such countries and from places not so far away from which wheat is generally carried in steamers, form no criterion of the relative exports from the countries in the course of the year. The quantity on passage from the American Atlantic ports—including the United States and Canada—was 3,497,600 bushels; of this the Canadian contribution must have been a comparative trifle. From Australia and New Zealand there were on the way 2,688,000, and from Chili 864,000 bushels. All, or nearly all, the wheat from these places is carried in sailing ships, and the voyage is long and tedious. Egypt and British India contributed 944,000 bushels—most of it doubtless from the land of the Pharoes. Russia's quota was unprecedentedly small for that date—only 144,000 bushels, of which 48,000 had left Taganrog and the other ports on the Sea of Azov and 96,800 were from Odessa. All other countries combined contributed only 124,000 bushels, making an aggregate of 12,173,600 bushels on passage to the United Kingdom. Many of the vessels, however, call at British ports only to receive orders as to the places at which they must deliver their cargoes, so that all this wheat will not necessarily be converted into British brawn and muscle.

IS IT A MISFORTUNE?

No International Dairy Fair will be held this year here or elsewhere in this country. Has an International Dairy Fair ever been seen here? Well, we shall not now argue whether the name under which the dairy show was held here in '78 and '79, was or was not a misnomer—we merely mean that that sort of an International Dairy Fair will not be repeated anywhere this Fall. True, this has been a foregone conclusion for some months, but the official announcement was not made until last Monday afternoon, when a very small handful of the officers and managers of the moribund or defunct institution met here to make up a plausible reason for the intermission. The Presidential election offered them the desired pretext, and it was accordingly proclaimed that no fair would be held, because to hold it in the heat of the Presidential canvass would be to insure failure; or, barring this, to subject those interested in its success to trouble and expense for which no amount of success could compensate them. Back of this ostensible reason, however, is the real one. The two former fairs were got up incidentally for the benefit of dairymen, but primarily for the advantage of a couple of rival salt dealers, and these having come to loggerheads, refuse to co-operate with each other, and so the Great International Dairy Fair has collapsed—at least for the present. Moreover, farmers everywhere, but especially at the West, have begun to be a trifle doubtful whether the benefit they obtained from the display of an array of packages of butter and cheese before sight-seeing city folks compensated them for the injury done to their business by the advertisement given to oleomargarine by exhibiting it at the same time. Well, by this time twelvemonth our farmers *may* have become enterprising enough to take a deeper interest and a more prominent part in the management of an exhibition peculiarly their own; the rivalry of the salt men may have become less wrathful; the venders of oleomargarine may be less audacious, and— But among all the obstacles to an International Dairy Fair this year, one only will certainly be absent next season—there will be no Presidential election.

OH, FOR A PROPHET!

In spite of the fact that the aggregate wheat crop is somewhat larger this year than last, the stock in the hands of dealers is considerably less. On Oct. 23 last the visible supply of wheat, comprising the stocks in granaries at the principal points of accumulation at lake and seaboard ports and the shipments by rail from Western lake and river ports, amounted to 17,480,091 bushels against 25,691,223 bushels on Oct. 25, in '79, or a decrease this year of 8,211,132 bushels. The great rise in the price of wheat last year, after a large part of the crop had left the hands of the producers, has led farmers to hold on to their wheat this year in the hopes of a like advance. Moreover, last year the indebtedness of the farmers was considerably heavier than it is now and consequently more of them were forced to realize on their crops at the earliest moment, to lift mortgages or pay interest on them, to meet other liabilities and often to obtain money for household expenses. In the absence of pressure from this cause during the present season, many of them are anxious that a part at least of the great profits from their product, that went into the coffers of the dealers last season, should go into their own pockets this year. It should be borne in mind, however, that the rise last year was largely due to the most gigantic wheat speculation this country has ever witnessed, which proved ultimately disastrous to the managers of it. At present there are no signs of a similar movement on the part of dealers this season, so that this factor in the possible advance of prices will probably have to be eliminated this year. In a short time, too, navigation will have closed and the railroads are sure to raise freight rates, while in Spring our wheat will have to meet competition from the surplus of all the wheat-growing nations of the world, some of whose harvests occur about the end of our Winter. On the other hand, the latest advices with regard to European crops show, at the best, no improvement on former reports. The average yield in the United Kingdom is reported considerably less on a somewhat larger acreage than we mentioned week before last, making the aggregate yield about the same as that given by us. The quality of our wheat, too, is put down at 10 per cent. better than last year on the Pacific Coast, and from 12 to 15 per cent. better in the rest of the country. There is an opportunity for realizing a large fortune before the man who can accurately foretell the prices of wheat during the coming season.

BREVITIES.

ALL competing for our Golden Ovoid Mangel little premium will now send in the weights of the three largest roots at once. We may call for them to be sent to the RURAL office by express at our expense.

IF the rows of our Blount's Corn had been nearer together; if they had been three feet six inches instead of four feet three inches—would the yield of corn have been greater or less? Who can tell? Were we to act upon our present impressions and were we again planting corn for a great yield, we should choose three feet nine inches as promising a better yield than either of the other distances.

JUST as this issue of the RURAL is going to press, we are saddened by the news of the sudden death, on Sunday night, Oct. 24, of Mr. R. F. Johnstone, the able editor of the Michigan Farmer. While his manly character endeared him to a large circle of friends, his indefatigable labors and sterling honesty in the editorial chair make his death a heavy loss to the agriculture of the country, and especially of his own State.

IT is said that the fashionable dames of the City of London alone spend £100,000 (say about half a million of dollars) on flowers during the season; what, then, must be the annual cost of flowers for the whole Kingdom! Florists in the vicinity of London pay from $30 to $70 rent per acre for the land they cultivate, and yet many of them make small fortunes in the course of a few years in growing flowers. Violets alone have netted from $500 to $1,000 per acre, and other flowers in proportion. But sometimes there is a glut in the market, and little or no profit is then realized. Of lavendar water, about 28,000 gallons are annually distilled in England. Of hyacinths, tulips, crocuses, tuberoses, pelargoniums, Lily of-the-valley, roses, bouvardias, gardenias, fuchsias, myrtles, hydrangeas, mignonette, and some other flowers, such quantities are produced that it would be impossible to give an account of them.

LATE advices from California indicate that in view of the great decrease in the wine production of France, owing to the ravages of the phylloxera, foreigners are already looking to that State for a supply of wine. A leading German wine merchant has written to his San Francisco correspondent that he thinks the pure, unadulterated red wines of the Golden State will be better appreciated in Europe than the Spanish wines of the same class, and inquiries have come even from Egypt as to the character and extent of the vintage there. This is unusually large, amounting to about 10,000,000 gallons; yet this production is but a trifle in comparison with the vintage of France before the ravages of the phylloxera had seriously injured her vineyards. For the 18 years immediately preceding the French revolution of '48, the annual product averaged 800,000,000 gallons. During the Empire it rapidly increased until in 1869 it was 1,865,000,000 gallons. In 1870 the depredations of the phylloxera began to be seriously felt, yet in '75 the vintage reached its highest point—2,239,000,000 gallons. Since then, however, there has been a steady decline to 1,120,000,000 in '76; 1,506,000,000 in '77; 1,306,000,000 in '78, and 800,000,000 in '79—just about the same product as half a century ago. There is a standing offer of a reward of $60,000 made by the French Academy of Sciences for the discovery of a remedy against the pest, but hitherto the only hope has been in the planting of American vines, the roots of which appear to offer a greater resistance to the insect than do the native vines of any European country.

Literary Miscellany.

OUR SHIPS AT SEA.

How many of us have ships at sea,
Freighted with wishes, and hopes, and fears,
Tossing about on the waves, while we
Linger and wait on the shore for years,
Gazing afar through the distance dim
And sighing, will ever our ships come in?

We sent them away with laughter and song,
The decks were white, and the sails were new,
The fragrant breezes bore them along,
The sea was calm and the skies were blue,
And we thought as we watched them sail away
Of the joy they would bring us some future day.

Long have we watched beside the shore
To catch the gleam of a coming sail,
But we only hear the breakers' roar
Or the sweeping night wind's dismal wail,
Till our cheeks grow pale, and our eyes grow dim
And we sadly sigh, will they never come in?

Oh! poor sad heart with its burden of cares,
Its aims defeated, its worthless life,
That has garnered only the thorns and the tares,
That is seared and torn in the pitiful strife,
Afar on the heavenly golden shore
Thy ships are anchored for ever more.

INMATES OF LESTER HALL.

(Continued from page 726.)

CHAPTER XV.

VENGEANCE FALLS UPON HERSELF.

In a breathless silence Cecil and Dr. Carewe stood for a few moments facing each other. The light from the hanging lamp fell upon both faces, and lighted up the shamed, stricken agony of his—the disdainful anguish of hers.

"Now do you understand?" she said, speaking slowly, with cruel precision and coldness. "Do you understand why I strove to win your love?—that I might get my own revenge!"

"Revenge on me for that?" he said, hoarsely, looking at the rigid calm of her face with the yearning of despair in his piteous glance. "Is that your justice, Cecil?"

"It is my retribution," she said, calmly. "For it I won your love; for this moment I have striven, and now I have taken my vengeance!"

"Great Heaven!" he said, brokenly, as his frame shook with a sudden shudder, and his lips could hardly frame the words, "for a brother's——"

She interrupted him fiercely.

"And why not, she said, bitterly. "Why not?"

"It is not just," he said, brokenly, as he turned from her; then his great love mastered him, and he caught her hands in a fierce, nervous clasp, and drew her to him.

"My darling, have pity!" he said, earnestly. "What can I do to atone. Save your sister's life; they say I helped to save it; will it not atone for that other whose loss you yourself hardly regretted as I did? If you will trust your happiness to me, Cecil, I shall hold it as the most precious treasure. Nay, you shall not go; you shall hear me!" and, before she could resist him, he had caught her in his arms, and was looking with mad longing into her eyes. "Answer me—you will trust me, Cecil? Nay, you shall be mine; I love you! I will not give you up!"

Cecil paled to her lips and her eyes flashed.

"Coward!" she said, scornfully.

And at the contemptuous word his clasp fell from around her, and he drew back slightly, while she looked at him for a moment with an expression of superb disdain. Then her eyes fell, and with a sudden gesture she turned from him.

"Forgive me!" he said, hoarsely. "I was mad, but the madness is past. Spare me yet one moment more, and I will trouble you no longer!"

His voice was choked and broken, and the vibration of intense suffering in his tone made her pause. She stood still, her face averted from him, her head erect. With all her haughty calmness there was a quiver on her lip.

"I cannot give you up," he said, at length, in a broken voice of pain. "Cecil, have you no pity? You gave me hope—you let me be happy for a few brief moments—but now you have no mercy! I would lay down my life for you—I would give you all I hold most dear! Have you thought of what you are doing? Have you ever asked yourself at what a cost to me you have gratified your caprice?"

"It is no caprice," she answered him, haughtily, without a change on the beautiful white face as she spoke.

"No caprice! True, I had forgotten," he said; and as he looked down at her with his longing, miserable eyes, it struck him then how heartless she must be to wreak such a vengeance, and his voice died away in a sob of anguish too deep for words, "You to betray me thus!" he cried in a moment—"you, Cecil!"

The unutterable sadness and tenderness of his voice struck upon her heart, and she turned to him for a moment, all the rigidity fading from her face, and a warmth of passion replacing it.

"Even I!" she said, with a break in her voice, of pain, of triumph, of anguish and of joy.

"If you had ever loved, you could not have done this thing," he said in a low tone of pain. "Had your own lips not borne witness against you, I should not have believed it. Against all the world I should have held you true!"

The words stung her as no more violent reproach could have done, and she shivered as they fell upon her ear. For a moment she seemed as if she would have uttered some words of apology or atonement, but she checked them.

"Let me compliment you on your histrionic powers," she said, shortly. "And now, if you will excuse me, I will wish you good night."

He stood for some moments where she had left him, stunned as it were by this blow, which he had no power to resist, and which had fallen upon him with crushing force. He had lost her; lost her completely and for ever, and in the anguish of that thought he could not realize the wanton cruelty of her conduct, the unwomanly revenge she had shown!

A mist came before his eyes as he thought of that hope he had cherished which had been so rudely dispelled—of that love which had given him a few short hours of joy, purchased by a lifetime of suffering. He was a man young and strong, yet he shuddered and sank down on the couch as he remembered, bowing his head in a stupor of misery on the cushions where she had rested.

How long he lay there he never knew, but after a time a friendly hand was laid upon his shoulder. He lifted his head and raised his eyes, full of a blind, vacant misery, to the pleasant kindly face of Mr. Edgar bent upon him full of concern and alarm.

"Lawrence, are you ill? What is the matter, old fellow?"

Dr. Carewe made no answer, but he sat upright, and pulled himself together.

"We thought Cecil was with you," said Mr. Edgar, gently. "Mattie has gone to bed. Lawrence, let me get you something; I am sure you are ill."

"No, I want nothing," was the quick answer. "Have patience with me for a moment, and I shall be all right."

He rose, and leaving the conservatory, went out on to the balcony beyond, pushing back his hair from his brow as the cold night air blew upon his face, and his breath came in the quick gasps of a man in pain. Mr. Edgar watched him in silent anxiety; he guessed that some terrible sorrow had come to him—it was impossible to doubt that, and it seemed as if his bodily strength was unequal to the strain upon it—as if it would fail him in his necessity.

Mr. Edgar knew how great that strength was; more than once he had proved the fearless courage of his friend during their intercourse together. He had seen him arrest the headlong course of a pair of infuriated horses; he had been by his side when he had rescued a woman fainting with terror from a crowd of roughs who would have trampled her under foot; he had been with him during a storm in the Atlantic, on board a thirty-ton yacht, and remembered how bravely and cheerfully he had sustained the courage of the crew, and heeded nothing of the danger; and he had never seen him moved as now.

The night air blowing fresh and chill revived him dispersing the mists from his troubled brain, and awakening him to a sense of the blow which had fallen upon him.

"Lawrence," Mr. Edgar said, tenderly, his own face pale and troubled, his own voice unsteady, "what is this that has come upon you? Will you not trust me, old friend? You know there is nothing on earth I would not do for you."

Lawrence Carewe stretched out his hand and grasped his friend's with a pressure that spoke louder than any words.

"I know it well, but you cannot help me in this, Edgar. It is my own folly, and I deserve to suffer; but the blow was sudden and unexpected. Somehow," he smiled—a smile sadder than the tears which stood in his gray eyes—"somehow I had been mad enough to hope—wild as that hope was; but I am awake now—I have come to my senses, and——"

"Cecil—she has refused you?" said Mr. Edgar, coming suddenly to a sense of the situation. "How shameful, when she has encouraged you so evidently! She is just as heartless as——"

"Hush! hush! I cannot bear that, Edgar! I was ready enough to blame her a short while ago; but now I can only feel—that I love her."

"Lawrence, old fellow I wish I could help you," said Mr. Edgar, unsteadily, touched to the heart by the terrible grief which looked at him out of the weary, haggard eyes of his friend. "Can I do nothing?" Shall Mattie speak to her?"

"Of what avail? She gave me no undecided answer. I'm not the first man who had to give up the happiness of his life, nor shall I be the last. And now good night, Edgar."

"Nay, I am going with you," said Mr. Edgar, resolutely, and Dr. Carewe looked at him and laughed a low, bitter laugh of pain.

"There is no river on my way home," he said, bitterly. "You need not be afraid, Edgar.

As the two young men passed out of the dining-room, and stood for a moment in the hall, putting on their overcoats, neither of them saw a white face looking over the banisters, and two large eyes watching Dr. Carewe with a passion of pain and love in their depths. Then, as they opened the hall-door and went out, the white figure fled rapidly upstairs, and the next moment Cecil was lying on her bed, struggling with a passion of tears which shook her slender frame from head to foot, and left her exhausted as a child.

If Mr. Edgar could have seen her thus he might not have had such hard thoughts of her as those which filled his heart, as, having left Lawrence Carewe at his door, he drove rapidly in the direction of his own house.

CHAPTER XVI.

ENGAGEMENT.

The gray dawn is breaking, and the light is appearing in the eastern sky, when Cecil Lester raises herself from her pillows and gazes vacantly around the room. How the night has passed she cannot tell, for the passionate tears and sobs have exhausted her to stupor; and as she rises and stands still for a moment, trying to recall what has happened, she staggers feebly, and is forced to catch at a chair for support.

The last two or three hours have been a complete blank to her. Whether she has slept, or whether she has fainted, she does not know. The reaction following on the great mental excitement of the evening previous has come upon her. The strained nerves have given way, and she sinks down wearily on a great armchair which stands at her bedside, pushing back her hair from her brow with trembling fingers, and drawing each breath sadly and wearily.

All is intensely still in her room and in the house. None of the household is stirring yet; and as her hand falls heavily to her side again, she wonders dreamingly why she still wears her evening dress.

Then suddenly she remembers, and there comes before her Lawrence Carewe's face, pale, agonized, reproachful, as she had seen it last night, and her head sinks again upon her hands as she tries to shut out the mute anguish of those gray eyes, and a shudder runs through her from head to foot.

"What have I done—what have I done?" she murmured between her pale lips. "Oh! what have I done?"

And the answer flashes before her as if written in letters of fire:

"You have kept your vow—you have made him suffer—you have attained your vengeance! Are you not happy?"

She rises from her seat, and paces up and down the room. Every pulse within her is beating and throbbing.

"What has come to me?" she says, half aloud, as she paces to and fro, "what has come to me? Should I not rejoice? Why—why—why do I suffer like this?"

She draws back the curtain, and opening one of the windows, leans out to the cool, fresh morning air. But it seems to give her no relief; and turning away with a gesture of weary passion, she faces the truth at last.

"I love him—I love him—I!" she says, passionately. "And he, how will he think of me? How will he despise me now? He has seen me as I am; he knows me now! How long will his love last—how long?"

She breaks into a laugh, bitter and forced, as one who laughs in a death-agony. The warmth of the room oppresses her. She feels choked and stifled—she sees still the grieved and wondering eyes—she hears again the broken, pleading voice!

"You to betray me thus!" it says, sadly. "You, Cecil!"

"This is folly—this is madness!" she says, after a pause. "I have but kept my vow. He deserves to suffer—let him do so! I will not grieve. He has brought it on himself. Oh! Rex.—Rex., you know now that I have kept my promise—at what a cost!"

She goes to the looking-glass, sees her face is colorless with the agony of the past few hours. Its glory is faded, its loveliness gone. The great lustrous eyes look out at her, dim and weary. She turns away with a bitter laugh.

"Let it go," she says, passionately—"let it go! It has done its work. I have no need to be pretty now!"

A hard, bitter anguish sweeps over her face, and staggering forward, falls prone and helpless, her proud head bowed, her face white with the whiteness of death, her eyes closed like one dead.

And thus her maid finds her a few minutes later and stands aghast at the sight of her young mistress stretched there, still wearing the evening-dress she had put on her the night before; and glancing at the bed, she sees that it is undisturbed.

She does not summon any assistance. Some instinct tells her that it will be more prudent not; for Mademoiselle, the maid is a wise woman in her day and generation, and she sees that this is no ordinary fainting-fit. So she kneels down by her mistress, raises the beautiful head on her arm, and applies restoratives. By-and-by Cecil's senses return to her; the sweet lips quivor, the heavy eyelids are lifted, and she looks wonderingly about her.

"You are better?" says the maid, gently, as she assists her to rise, and places her in a chair.

"Yes, I am better," says Cecil, faintly. "I do not know what made me faint. Lisette, do not tell Miss Lester; it would make her anxious."

"You were overtired, perhaps," suggests Lisette, trying to speak unconcernedly, but feeling her heart ache for the misery on Cecil's face. "That long ride yesterday was too much for her."

"Yes," said Cecil, eagerly, "that was it, Lisette. But do not tell Miss Lester."

"You may count upon my discretion," said Lisette, quietly; and though she kept her young mistress's counsel, she "thought the more," and puzzled her brain to discover the cause of her illness with but little success.

Meanwhile the preparations for Mattie Lester's marriage went on apace, for the health of the bride-elect was completely re-established, and Mr. Edgar had pleaded so eloquently for an "early day" that Mattie had not had the heart to resist his entreaties. The wedding-day was fixed for early in autumn, and the young couple were to spend the winter abroad, taking a long tour in the South of France and Italy.

"It will be far better that Miss Lester should not be exposed to the variations of this variable climate of ours," Dr. Carew had said. "If I were you, Edgar, I would keep her abroad all the Winter; there are lovely spots in the South of France where you can spend your honeymoon, and Cannes, Nice, and Mentone are all very gay during the winter season."

"As if we shall want gaiety," said Edgar, gaily.

But he took his friend's advice. A pretty villa was engaged at Cannes, which was to be their headquarters for the winter months, and Mattie set about the business of the trousseau with all expedition.

Of course the wedding-outfit was to be a very costly and elaborate one; Mattie's future position demanded that it should be so. Miss Lester herself was in a constant state of appointments with milliners and dressmakers, boot makers and jewelers, until Mr. Edgar grew quite frantic at the demands on her time.

"I never see you now," he grumbled, half comically, pathetically, one day, when they were alone. "It is too bad, Mattie; there are scores of things I want to consult you upon."

"You will get quite enough of me by-and-by," said Mattie, laughingly. What do you want to consult me on now, Edgar? It seems to me that I have as many consultation as Mr. William Gull himself."

"Yes, with milliners and dressmakers," said Mr. Edgar; smiling. "Do you think I wont allow you to buy any more clothes, Mattie, that it is necessary you should have so many? I never come here but you and Cecil are discussing patterns and styles, and shapes and makes, just as if you don't look pretty in everything," he added, fondly, as he drew her to his side.

"That's a very pretty and dutiful speech, she said, laughingly. "What is your business, Edgar? I only have an hour to give you, as I am due at Elise's at half-past twelve."

"There!" said Mr. Edgar, half ruefully, half triumphantly. "Is it not a true bill, convicted out of your own mouth, Miss Mattie? Well, my business will not take more than half an hour. Have you chosen the bridesmaids' lockets?"

"Yes, those with the pearl shield and the initials in diamonds," said Mattie.—To be continued.

MAGAZINES FOR NOVEMBER.

Appletons' Journal.—Contents.—The Rights of Married Women; All Alone, a story (in Two Parts—Part Second); The Influence of Art in Daily Life; Part IV. Beauty; The Growth of Sculpture; Literary Success a Hundred Years Ago; A Colorado Sketch; The Life and Passion of Hector Berlioz; The New Renaissance; or, The Gospel of Intensity; Guizot's Private Life; Love's Heralds; Some Current Novels; Story of an Honest Man: Stillwater Tragedy; The Grandissimes; Salvage; White Wings; The Wellfields; Troublesome Daughters; The Confessions of a Frivolous Girl; The Worst Boy in Town; Anecdotes of English Rural Life; Editors Table: An Art Discussion, New American Comedies, Further about Infinitesimal Doses; The Mudfog Papers; The Peasant in Art and Literature.

Among the penalties which, according to popular report, fame of any kind is sure to exact, one of the heaviest, perhaps, is that which the successful author has to pay when the juvenile or other feeble productions which he himself has consigned to oblivion are dragged forth without his consent from their half-forgotten hiding-places, and exposed to the scorching light of his later-achieved celebrity. There are few authors, probably, even the most successful, who have not at one time or another written things which they would willingly have the public overlook; and their bitterest foe in cases of this kind is the fanatical admirer or speculating "bibliographer" who, together, are rapidly becoming one of the greatest pests of literature. The latest sufferer from this sort of posthumous pillorizing is Dickens. No other author, probably, of real genius and power, ever took a more lenient view of his own productions than Dickens, and it might fairly be inferred that anything that he choose to leave unutilized had better be left in the obscurity to which it had sunk. Not so, however, have his mercantile-minded admirers been willing to admit. Even Forster made use in his biography of every scrap of unpublished writing upon which he could lay his hands, including the foolish preface to the first edition of "American Notes," which his friends had wisely induced Dickens to suppress; and now in "The Mudfog Papers" we have a glimpse of the lowest deep which the profane eye of the curiosity hunter can reach.—Editor's Table in Appletons' Journal for November.

The Future of Weather Foretelling.—In no other part of her wide realm has Science done so little for the good of man or her own fame as in the department of meteorology. In the solid earth her prophecies have long had a high value, in the far-off heavens her empire is affirmed, but in the unstable air between these two well-possessed provinces there is a region that is not yet subjugated. Around the border of the domain of meteorology some gains to the cause of law and order have indeed been made: we control the lightning, we are able to track a clearly defined storm for days on its path, and can help the sailor to knowledge that often enables him to escape its clutches when it assails him on the deep sea; but as for foretelling the weather in any proper sense, we have not yet attained to it. Is it attainable? Can we hope to compass the conditions of our days so that we may sow and reap, travel, feast, or make war in weather of our choice? This is, after all, perhaps the most interesting of the questions that the future history of science must determine. But though the perfect answer is not to be given at present, there are some things in the existing conditions of our science that make us hopeful that we are but at the beginning of weather forecasting

There have been two distinct scientific efforts at weather foretelling, as distinguished from the current survival of the modes of thought of ancient ages that are introduced in our ordinary weather prophecies, that, undertaken by Admiral Fitzroy, in England, and that, begun in this country by the United States Signal Corps, under the control of the late General Myer. Both of these have made their basis of the simple principle that weather always has a history; that it means conditions that pass from one region to another by certain laws of movement and at a certain rate. This general fact was long ago recognized by me-

teorologists, but it was not until the telegraph enabled knowledge to outstrip the storms that it was possible to make any use of it in foretelling the weather. By the admirable labors of the United States Signal Service this method of announcing the weather that is journeying towards any locality has been brought to a high point of perfection, but it has not to any extent helped us to foretell the creation of weather. When a weather area forms in the far West, it is now traced as clearly as the path of an army, until it passes away. Sometimes the state of the barometer will tell something about storms that have not yet gathered themselves for their eastward march, but beyond this there have as yet been no means of foreseeing. The weather bureau is of no more use than a ground-hog or a goose-bone for telling us whether our coming Spring or Summer is to be warm or cold, rainy or dry. Is this the end of our advance? Can we hope to do no more than take the storms we find afloat, and trace them on their courses; or can we hope to look behind them to the conditions of their origin so clearly that we can foretell their time and place of working? —[N. S. SHALER in November Atlantic.

HARPER'S MAGAZINE.—Contents: Saint Cecilia; Rabelais at Home; Around the Year, A Poem; Saline Types; Upon Spur, A Poem; Old Dutch Masters; The Broken Bars, A Sonnet; The Level Land, A Poem; An Autumn Pastoral; Pig-sticking in India; In Western Massachusetts; Midnight, June 30, 1879, A Poem; The Drift-wood Fire, A Story; White Wings, A Yachting Romance. (Concluded.)—Porcelain Painting; Washington Square, A Novel; Securing a Competence; Rev. Mr. Bland's Wrestle with the Chester White Hog, A Story; October, A Poem; A Scientific Common School Education; The Battle of King's Mountain, A Poem written for the Centennial Celebration of the Battle, October 7, 1880; Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record; Editor's Drawer.

WILL EDUCATION YIELD SUBSISTENCE?—An education, yes; but what sort of an education? A bricklayer's education, an artisan's, a farmer's, would indeed help him to earn a living. A college education would give him a social advantage, but it would not, in itself, increase his chance of earning a living; it would rather diminish it. For, as was pointed out in an interesting paper lately published in this Magazine, our colleges do not, like the French and German universities, instruct a young man in the bread-winning pursuits; the American colleges are, on the contrary, institutions for general culture. I do not take up the question here of the amount and value of the culture they supply. The point for us to note is that the educated young American who has not a special education as a bread-winner is worse off, as to his money prospects, than the young American who has no college education at all. Dig he can not, and to beg he is ashamed. Two of the professions at least are fatally overcrowded. The United States, with a population not greatly larger than that of the German Empires, graduates every year five times as many physicians; for the German Empire limits the number of its doctors, and we do not limit that of ours. Very many of our physicians not only wait years for practice, but never get into practice at all. It is much the same with the profession of law. In both professions there are prizes for a few, and failures more or less complete, for the many. The engineering, mining, and other scientific professions offer a somewhat better chance, and public life, almost neglected as a profession, will attact a better class of young men from year to year. But upon none of these, save in favored and exceptional cases, as where a son succeeds to his father's practice, can a young man depend for fortune, or even for immediate support. They, too, offer a certain social dignity. But as a rule it is the laborer, artisan, or tradesman that has the better chance of supporting himself; it is the educated man that has, more frequently, to wait before he can pay his way. If, therefore, we educate sons, it is all the better reason why we should provide, not indeed for their independence, but some aid during the years which they are likely to spend in waiting before they can achieve their position.

It is to be remembered, too, that these years of waiting may become, with such aid, years of scholarly or scientific accomplishment, if not of money-making; years of strengthened preparation; years that might introduce and brighten a career, instead of wasted years that cloud or spoil it.—T. M. Coan, in Harper's Magazine for November.

LIMOGES, AND ITS PORCELAIN.—The traveler who, leaving Paris by express at 10 A.M., reaches the Orleans depot at Limoges at six in the evening, will see spacious boulevards, imposing buildings and a general air of stateliness and pretension, recalling the metropolis he left behind him in the morning. His omnibus will whisk him through streets crowded with promenaders, a picturesque panorama of well-dressed people, with a generous sprinkling of the light-blue jackets of the chasseurs, the gleaming helmets of the dragoons, the red kepis of the infantry, the broad-brimmed hats and sable mantles of the priesthood and the red-and-orange headkerchiefs of the working-women. If it be late in the season and the days are short, he will see at every turn cafes ablaze with light, and the wide sidewalks before them lined with tables at which, cool as it may be, crowds of loungers are seated sipping beer, absinthe or eau sucree. But, looking up the dingy side-streets, here and there he may detect, by the lines of flickering, straggling gas-lights, glimpses of another Limoges—glimpses of steep streets ending in stairways; of narrow and darkened passages where the opposite buildings nod to each other from across the street until they all but touch; of courts where curious little enshrined images of the Madonna and the saints look down from niches in the corners, and where heads are peeping out from every window to catch a whiff of evening air; and of somber alleys, each lighted by a single lamp suspended midway, under the uncertain rays of which swarms of children and dogs are vying to awaken the loudest echoes.—Geo. L. Catlin, in Lippincott's for November.

BOTANIZING ON THE COLORADO DESERT.—In February of 1877, by way of the stage road between San Diego and Fort Yuma, I made a little expedition across the interesting region above named. A desert is not naturally supposed to be the most eligible locality, nor Mid-winter the best season for making botanical excursions, yet seldom has a week's recreation of that kind given me more satisfaction than that upon which I have preserved the following notes:

In passing from west to east across Southern California, the first glimpse one gets of the desert is a fine bird's-eye view. From the San Diego plains, all treeless, brown and dusty, an easy two days' journey brings the traveler up to the level of that broad plateau which constitutes the summit of the coast range. Across this forty-five miles of mountain top, one travels pleasantly; now through handsome groves of evergreen oaks, then among a succession of low, rounded, stony hills, between which some bits of fresh, green mountain pasture spread themselves; here passing a settler's cabin with its newly ploughed fields and its group of blooming peach trees, and there meeting a merry, boisterous gang of mountain herdsmen. Having thus come to the eastern verge of the plateau, the great wilderness breaks all at once upon the view, beginning a dizzy half mile down beneath your feet, and stretching away to the eastward for a hundred miles. It was past the middle of the afternoon when I reached this interesting point, and paused to rest a while and enjoy the novel scene, so desolately grand, which lay before me. The region in question is far from being a flat, monotonous expanse of naked sands. Its general level is broken by many abruptly rising knobs and peaks and by several prolonged chains of high and sharply defined rocky hills, all lifting themselves up like precipitous islands above the even surface of a sea; and although these peaks and ranges are destitute of verdure, and red as the sands that drift about their bases, they yet combine to make a most impressive picture when viewed at a distance, and from this aerial elevation where the desert first appears in sight. Aware that the stage station where I must pass the night was not more than two miles away by the steep, winding road, I lingered here until the sun was near its setting, and the shadows of the peaks and pyramids I sat among, were measuring their dark lengths upon the plain afar below and the purple evening clouds had reflected their own almost gorgeous coloring to the vast, varied landscape that stretched eastward and northward so very far away. This strange sunset scene was beautiful beyond all desciption, and will be treasured for a lifetime in the beholder's memory.—Edward Lee Greene, in American Naturalist for November.

Byron; Mr. Ruskin on Wordsworth; White Wings, A Yachting Romance; A Colorado Sketch; Letters from Constantinople; Hypnotism; The Impending Crisis in Turkey; The Dreams of Youth; Archibald Forbes (with Portrait); Literary Notices; Foreign Literary Notes; Science and Art; Varieties.

APPARENT SIZE OF THE MOON.—M. J. Plateau proposes a method of estimating approximately the apparent distances at which the moon seems to different persons to be in the sky. This means consists in looking at the moon steadily until the retina is sufficiently fatigued to produce an "accidental" image or ghost. The observer must then turn his gaze to a blank wall, on which he will see the accidental image projected as a tinted patch of the same shape as the moon. He is then to retreat from, or advance to, the wall until the image appears to him to be of the same size as the moon did itself. The distance measured off between the observer and the wall will be the same as that at which he unconsciously takes the moon to be. One of the sons of the author having made this experiment, found the distance to be in his case about fifty metres. This seems a small distance, but it was the result of a single experiment under circumstances which were not very favorable. M. Plateau concludes the brief memoir on the subject, presented by him to the Academie, by cautioning all persons who may be interested in the subject to take care, in repeating the experiment, lest the great brilliance of the luminary should damage their sight.

AN old sign is, that a child grows proud if suffered to look in a mirror when less than twelve months old; but what the average infant can see in a mirror at so young an age to make it proud is difficult for any but its parents to understand.

For Women.

CONDUCTED BY MISS RAY CLARK.

MICHAEL'S MALLET.

LONG, long ago in the olden day,
On a slope of the Tuscan hills there lay
A village with quarries all around,
And blocks of marble that piled the ground;
And scattered among them everywhere,
With wedge and hammer, rule and square,
With the dust of the marble powdered white,
Sat masons who chiseled from morn till night.

The earliest sound that the baby heard
Was neither the whistle nor song of bird,
Nor bleating of lambs, nor rush of breeze
Through the tops of the tall old chestnut trees,
Nor the laughing of girls, nor the whoop and shout
Of the school at the convent just let out,
Nor the tinkle of water plashing sweet
From the dolphin's mouth in the village street.

But foremost and first that sharp and clear
Arrested the little Michael's ear
When he waked from sleep, was the mallet's knock
On the chisel that chipped the rough-hewn block;
From the dawn of the day till the twilight came,
The click of the tools was still the same;
And constant as fell the fountain's dip,
Was the *tap-tap-tap!* and the *chip-chip-chip!*

And when he could crawl beyond the door
Of the cottage, in search of a plaything more,
Or farther could venture, a prying lad,
What toys do you think were the first he had?
Why, splinters of marble white and pure,
And a mallet to break them with be sure;
And a chisel to shape them should he choose,
Just such as he saw the masons use.

So Michael, the baby, had his way,
And hammered and chipped, and would not play
With the simple and senseless sort of toys
That pleased the rest of the village boys,
They laughed at the little churches he
Would daily build at his nurse's knee;
They scouted the pictures that he drew
On the smooth, white slabs with a coal or two;
They taunted and teased him when he tried
To mould from the rubbish cast aside
Rude figures, and screamed "*Scultori!*" when
His bits of marble he shaped like men.

But who of them dreamed that his mallet's sound
Would ever be heard the earth around?
Or his minute churches in time become
The mightiest churches of Christendom?
Or the pictures he painted all the dome
Of the Sistine—grandest of sights in Rome?
Or the village baby that chiseled so
Be the marvelous Michael Angelo?

—Margaret F. Preston, in Wide-Awake.

THE GARDEN OF THE MIND.

SITTING down to my desk last evening my eye was attracted to a paragraph in the paper lying near. Drawing it toward me I read—"If soils require the warmth of sunshine, the gentleness of showers and the roughness of storms, so do minds according to their different natures and conditions need often to be rewarded by smiles, frequently to be assisted by good nature, and at times to be shaken and awarded by punishment. They are only obstinate and sullen natures, however, that want the last, as they are the most hardy and stubborn plants and trees that require to be moved by the tempest to the very roots."

So then, I said, leaning back in my chair, so then, I am chief gardener of that bit of personal property commonly called the mind; not a very desirable piece of real estate I must admit, for (drawing my face down to harmonize with the doleful words of an eminent divine,) there are "plenty of weeds but no flowers."

What's the reason? Because—— I gave it up. I never puzzle long over conundrums at any time and this being one of the most difficult ever presenting itself I tried to dismiss it at once. No use—It returned again and again with a persistency that at last conquered. The mind is a garden of supreme value which we should seek with never failing zeal, to cultivate.

We marvel at the charms in Nature; we mark its growth and decay commenting upon its changes. Each fresh discovery we hail with delight, going into ecstacies over a new flower found in our rambles, yet too often forgetting that within the grasp of all lieth the opportunity to produce rarer blossoms than are strewn upon earth.

In our intercourse with the world we meet with people of whom we say: "For some reason an interview with them always seems productive of good; we part with them feeling wiser and better." Is it not because their mind is one vast field of rich blossoms and wide expanse of living verdure, with never a decaying or uncouth plant intruding? Or if an objectionable seed has drifted within the enclosure it has been driven so far back in the corners that we seldom come in contact with it.

There are other conservatories that remain unsolved mysteries to us. We never get beyond the high, cold, marble wall and the entrance is opened to but few. Then we catch glimpses of stately exotics that are to be looked at only, never to be touched, not a blossom, or leaf even, ever given away. We turn aside, wondering within ourselves how much happiness such minds might create and yet how little good they really accomplish.

Again, there are thorn-hedges surrounding the brightest, bonniest gardens. You get woefully scratched effecting an entrance, but once inside you account that scratching one of the happiest privileges granted humanity. The colors are dazzling the fragrance is delicious and the designs unique. There is a sort of confusion in the whole which, though not commendable, is certainly bewitching. Everything grows in the rich, warm soil, weeds as well as flowers, but occasionally the gardener is seized with a reproachful sense of duty and wages war against the weeds for a season, then rests again.

There is another field, yet so full of ugly sights is it that we recoil from its rank herbage, the vile weeds and huge thorns. We shrink from the poison odors and shudder when compelled to pass near. Poor, unweeded, ill-kept gardens! Should we pass them by? Would it not be better to tarry for a while and lend a willing hand to pluck out the weeds, even as we would from our own? What if a stain or scratch should be our portion, should we refuse assistance? No, a thousand times *no!* Underneath this mass of tangled briars and weeds may be found some little wild flower that is dying for the light—a little plant that, under the influence of cautious treatment and sunlight, will spring up to notice and cause the gardener to feel its worth, awaken to its beauty, and make way for its growth by uprooting all the weeds which hitherto had choked it.

I think that in assisting others we are apt to reflect too much upon how much good we might do if we possessed more. Let us leave these thoughts and return to our work with increased energy, uprooting the weeds with the fond hope that soon there will be only the flowers left—bright blossoms that we can scatter broadcast. ESTELLE.

VISITING.

WHEN guests arrive in response to an invitation, the mistress and master of the dwelling, whether a mansion or a cottage, should spare no pains to make the visit an agreeable one. Many well-meaning people, from over anxiety to do so, alter the entire arrangement of their households, and in consequence fail to achieve their object; for if a visitor perceive—and he is almost certain to do so—that you have changed your ordinary routine of living, an uncomfortable feeling that you are—to use a homely phrase—"putting yourself very much out of the way" will prevent any true enjoyment from being felt. Therefore the host's first care should be to make a visitor aware that his presence is not a disturbing element, and that the action of the domestic machinery will not be deranged in consequence. This is the truest courtesy, and a course which never fails to put a visitor at his ease. Let whatever is performed be done without apparent effort, so that the effect produced may be that the visitor finds himself a sharer of your own home-enjoyments—not that you have to tax your energies to afford him entertainment.

There should, however, be no sort of neglect on the part of either host or hostess, and the comfort of a visitor should be carefully studied.

For instance, the guest's room should be made as comfortable and pleasant as possible. If the weather is cold, a fire in the grate will be felt as a most welcome attention. Do not think it sufficient to ask, "Would you like a fire in your bedroom this evening?" Such an inquiry could hardly fail to have a chilling effect, and a negative reply would most probably be given. It is quite easy to judge whether the weather is sufficiently cold to make a fire an agreeable addition.

Pens, ink, paper, envelopes, matches and a few books and flowers, should find a place. Generally visitors bring their own writing-materials; but should these by chance be forgotten, it is pleasant for them to find that their wants have been anticipated. For the same reason, a properly-furnished work-box, with buttons, scissors, etc., should be provided, and especially if the visitor is a lady. It would be impossible to enumerate all these little conveniences, so much depending upon circumstances; but it is just these little things which have the most to do in making a visit an enjoyable one.

While visitors are with you do not, if anything occurs to annoy you, trouble them with the details of what has gone amiss. Such a course only tends to make them feel that they are putting you to some inconvenience.

On the other hand, the guest, perceiving something to be wrong, should abstain from making any remark upon it—should appear, indeed, not to have seen it. Equally reprehensible is it to suggest changes and alterations to the host—to criticize his taste or call his judgment into question. Or, if his children should be fractious or rude, it is out of place for the guest to remark upon it, or to find fault with what they say or do, if the parents do not see fit to interfere. There is a wide diversity of opinion upon some points as to what is agreeable or disagreeable—proper or improper. It may be said that all persons have their own particular ideas; and however much a guest might disapprove of what he saw or heard, it is bad taste for him to interfere in any way, or to attempt to effect a reformation; and any such interference would probably fail to effect any good result, and would almost certainly be resented—if silently. The proper course to pursue in such a case is for the visitor not to accept a second invitation to a house where he found the mode of life adopted by the inmates to be uncongenial to his taste.

From first to last a rigid observance of the law "bear and forbear," by host and guest, will be found essential to the preservation of harmony and enjoyment.—Correspondent.

OUTDOOR SAFETY.

THE fear of the weather has sent multitudes to to their graves, who otherwise might have lived in health many years longer. The fierce north wind and the furious snow-storm kill comparatively few, while hot winter rooms and crisping summer suns have countless hecatombs of human victims to attest their power. Except in localities where malignant miasmata prevail, and that only in warm weather, outdoor life is the healthiest and happiest, from the Tropics to the Poles.

The general fact speaks for itself, that persons who are out of doors most take cold least. In some parts of our country, near one half of our adult deaths are from diseases of the air-passages. These ailments arise from taking cold in some way or another; and surely the reader will take some interest in a subject which, by at least one chance out of four, his own life may be lost.

All colds we believe arise from one or two causes

1. By getting cool too quickly after exercise, either as to the whole body or any part of it.

2. By being chilled, and remaining so for a long time, from want of exercise.

To avoid colds from the former, we have only to go to a fire the moment the exercise ceases, in the Winter. If in the Summer, repair at once to a closed room, and there remain with the same clothing on, until cooled off.

To avoid colds from the latter cause, and these engender the most speedily fatal diseases, such as pleurisies, croup, and inflammation of the lungs, called pneumonia, we have only to compel ourselves to walk with sufficient vigor to keep off a feeling of chilliness. Attention to a precept contained in less than a dozen words would add twenty years to the average of civilized life.

Keep away chilliness by exercise; cool off slowly. Then you will never take cold, indoor or out.

THE CHARITY OF EXTRAVAGANCE.

Whenever the laboring men are out of employment they begin to hate the rich. They feel that the dwellers in palaces, the riders in carriages, the wearers of broadcloth, silk, and velvet, have in some way been robbing them. As a matter of fact the palace-builders are the friends of labor. The best form of charity is extravagance. When you give a man money, when you toss him a coin, although you get nothing, the man loses his manhood. To help others to help themselves is the only real charity. Whenever I see a splendid home, a palace, a magnificent pile, I think of the thousands who were fed, of the women and children clothed, of the firesides made happy.

A rich man, living up to his privileges, having the best house, the best furniture, the best horses, the finest grounds, the most beautiful flowers, the best clothes, the best food the best pictures, and all the books that he can afford, is a perpetual blessing. The prodigality of the rich is the providence of the poor. The extravagance of wealth makes it possible for the poor to save. The rich man who lives according to his means, who is extravagant in the best and highest sense, is not the enemy of labor. The miser who lives in a hovel, wears rags and hoards his gold, is a perpetual curse. He is like one who dams a river at its source.

The moment hard times come, the cry of economy is raised. The press, the platform and the pulpit unite in recommending economy to the rich. In consequence of this cry, the man of wealth discharges servants, sells his horses, allows his carriage to become a hen-roost, and after taking employment and food from as many as he can, congratulates himself that he has done his part toward restoring prosperity to the country.

WHAT "WIFE" MEANS.

Says Ruskin: What do you think the beautiful word "wife" comes from? It is the great word in which the English and Latin languages conquered the French and Greek. I hope the French will some day get a word for it instead of that *femme*. But what do you think it comes from? The great value of the Saxon words is that they mean something. Wife means "weaver." You must either be house wives or house moths, remember that. In the deep sense, you must either weave men's fortunes and embroider them, or feed upon and bring them to decay. Wherever a true wife comes, home is always around her. The stars may be over her head, the glow-worm in the nights cold grass may be the fire at her feet, but home is where she is, and for a noble woman it stretches far around her, better than houses ceiled with cedar or painted with vermilion—shedding its quiet light for those who else are homeless. This, I believe, is the woman's true place and power.

A SUN GLEAM.

After a Summer evening's shower how entrancing it is to behold the gorgeous embellishment the declining sun imparts to already lovely nature.

Then, the recent somber, dusty roads glisten like dark amber; and the tiny brooks are transformed into streams of purple wine. From every meadow-blade hangs a rich diamond, and a myriad of gems tip the tree leaves.

The wooded mountain-tops are magically beautified into masses of emerald; and if from the opaline clouds swings a rainbow, we think we have discovered where the flowers keep their colors stored!

Amid all this, the sweet evening anthem of the happy birds sounds through the fragrant air, and we, too, blend our thankfulness to the Great Giver of all goodness.

Home Adornment.—Nature is active in adorning her dominions; and man, to whom this beauty is addressed, should feel and obey the lesson. Let him, too, be industrious in adorning his domain—in making his home, the dwelling of his wife and children, nor only convenient and comfortable, but pleasant. Let him, as far as circumstances will admit, be industrious in surrounding it with pleasant objects: in decorating it, within and without, with things that tend to make it agreeable and attractive. Let industry make home the abode of neatness and order—a place which brings satisfaction to every inmate, and which in absence draws back the heart by the fond associations of content. Let this be done, and this sacred spot will become more surely the scene of cheerfulness and peace. Ye parents, who would have your children happy, be industrious to bring them up in the midst of a pleasant, a cheerful, and a happy home. Waste not your time in accumulating wealth for them, but plant in their minds and souls, in the way proposed, the seeds of virtue and prosperity.

Cheerfulness.—Carry the radiance of your soul in your face; let the world have the benefit of it. Let your cheerfulness be left for good, wherever you are, and let your smiles be scattered like sunbeams—"on the just as well as on the unjust." Such a disposition will yield you a rich reward, for its happy effects will come home to you and brighten your moments of thought. Smiles are the higher and better responses of nature to the emotion of the soul. Let the children have the benefit of them, these little ones who need the sunshine of the heart to educate them, and would find a level for their buoyant nature in the cheerful, loving faces of those who lead them. Let them not be kept from the middle aged, who need the encouragement they bring. Give your smiles also to the aged. They come to them like the quiet rain of summer, making fresh and verdant the long, weary path of life. Be gentle and indulgent to all, love the true, the beautiful, the just, the holy.

Every woman cannot be beautiful, but can be sweet-tempered; and a sweet temper gives a loveliness to the face more attractive, in the long run, than even beauty. Have a smile and kind word for all, and you will be soon more admired—nay, loved—than any mere beauty. A sweet temper is to the household what sunshine is to trees and flowers.

CORRESPONDENTS' CORNER.

If Bertha H.'s sister will send her address to us, we will forward it to Miss "M. D." who writes that she will give the information required concerning the games.

HINTS.

Brooms should always be hung up, and kerosene cans should always be set into an old tin dish which is past using for baking purposes.

To Clean Black Materials.—Take the article you wish to clean, on the side you intend to make up as the right side; brush well all the dust out of it; then take a piece of black flannel or an old black woolen stocking (it must always be black); dip it into cold coffee, and sponge well the material all over alike; then fold up each piece or breadth nice and even, and let it remain damp for three or four hours. Iron on the wrong side, and the old dusty, shabby dress will look just as fresh and bright as new. I have tried this receipt on black silk, paramtas, lusters and merinos, and consider it the best I have used. It neither streaks, deadens the gloss nor rots the material.

To Raise the Pile on Velvet.—When the pile is pressed down, cover a hot smoothing-iron with a wet cloth, and hold the velvet firmly over it; the vapor arising will raise the pile of the velvet with the assistance of a light whisk or clothes brush.

Scorched Linen.—Peel and slice two onions, extract the juice by pounding and squeezing; cut up half an ounce of fine white soap and add to the juice; two ounces of fuller's earth and a half pint of vinegar; boil all together; when cool spread over the scorched linen and let it dry on it; then wash and boil out the linen and the spots will disappear, unless burned so badly as to break the threads.

Be reserved, but not sour; grave, but not formal; bold, but not rash; humble, but not servile; patient, but not insensible; constant, but not obstinate; cheerful, but not light. Rather be sweet-tempered than familiar; familiar rather than intimate; and intimate with very few, and with those few upon good grounds.

To Clean Brass.—Salvers and flower pot vases in daily use, look better than new by always following the proper Algerian recipe, from a native of Tunis. Strew the salver over with sand, and squeeze some of the juice of half a lemon over it, sufficient to wet it, then rub round and round as hard as you can and for some time; carefully do the edge in the same way, and remember to be equally careful about the back, or else it becomes a mass of virdigris. Then wipe all the sand and lemon juice off with a clean rag or cloth, and squeeze some more lemon juice over the tray, rub it on, and then dry. Twice a week is necessary. This recipe should not be used on engraved trays.

The white wheaten loaves, considered so desirable, are by no means the most nutritious, as some of the most nourishing principles of the wheat are lost in the whitening process. By this process the flour is deprived to a great degree of its gluten and phosphate, both important elements of food. Whole meal flour has been offered to the public but its dark color has interfered with its sale. Bread made of such flour needs no yeast, as enough carbonic acid is evolved in its preparation to secure sufficient lightness of the dough. Some persons have supposed that a lack of the phosphates in the flour generally used by Americans was one of the causes of the defectiveness of the teeth so common in this country.

Exercise.—Exercise is a necessity; it prolongs life and greatly improves living; it better fits us for our duties; without it, we do not more than half live. He only who exercises sufficiently can know the joy of good health, good appetite, good digestion, refreshing sleep. It causes the blood to circulate quickly, freely and equally, and will drive away the blues. It increases respiration, thus bringing a larger quantity of elixir of life, oxygen, to purify and vitalize the blood. It rounds and hardens the muscles and educates them into every-ready, faithful and efficient servants of the will. It limbers the joints and strengthens every part of the body. It invigorates the mind and renders it active and efficient in all its operations.

Restoring Faded Flowers.—The majority of flowers begin to wither after being kept in water for 24 hours. A few may be revived by giving them fresh water with a pinch of saltpeter in it; and even quite withered flowers can be restored by placing them in a cup of boiling water deep enough to cover at least one-third of the stems. When the water has cooled the flowers should be bright and erect again. They may now be inserted in fresh cold water, after having shortened their stems by about an inch. Thin-petalled, white and light hued flowers, however, do not revive so completely under this treatment, as deep-hued thick-petalled blossoms.

Take Hop Bitters three times a day, and you will have no doctor bills to pay.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

"Economy!" I sighed as I said it: I am sure every one who has to practise it must be tired of the word. For the crops are garnered and average only one-third, a mid-winter thaw and subsequent frost having proved the ruin of the fruit buds in this warm valley, while those on more exposed situations were uninjured. The consequence is, that we have to live in the hope of a future that will give us better returns. "It is no fault of ours," I say to the children. "God giveth the increase, and we can but do our best." But the lesson is a hard one to learn, where the sons are steady workers almost to manhood, and the daughters of the house almost to woman's estate. So many wants and needs—food, dress, education, and the thousand other things that every housekeeper knows of. We are tempted to say, "How many idlers have to spare, and know not the need of *economy!*" Yet perhaps it is the very lesson we need, the best training our children can have, to teach them habits of carefulness in a too careless age, habits of saving among much waste. Who knows? the very thing we think so hard may be a blessing in disguise. Of course, we have plenty and to spare for a poorer neighbor, but we feel the necessity of inculcating habits of carefulness in a year when the crops are but one-third, and try therewith to be content. The children will be as healthy, the old garments will serve another season, the hearth-fire be just as bright, let us hope, and we will look forward to the Winter with cheerfulness and try many devices to make "ends meet." "Pay as you go and practise what you preach," is the best of mottoes—it ought to be engraved in every farmer's home, and taught by example to his children. So we are not to be down-hearted if times are hard. It will only teach us to exercise our ingenuity and look forward. I was delighted some years ago to see for myself that motto in Edward E. Hale's Sunday school, so often quoted, the last clause of which reads—

"Look forward and not backward
And lend a hand."

And among the many readers of the Rural there are those, I am sure, who need cheerful words of promise; who in their lives have to practice economy and deny themselves many things their hearts long for. But the lesson is not lost, and when times improve, or worldly goods come to us again plentiful and abundant, we shall feel able to appreciate them better for the years of self-denial, during which we have been called on to exercise economy.

DOMESTIC RECIPES.

For Burns or Scalds.

Varnish the wound with the white of an egg. The application of the egg is more soothing than sweet oil and cotton, the common remedy for burns.

Pickle for Curing Meat.

To five gallons of water allow eight pounds of salt, three pounds of sugar, three ounces of saltpeter, and two ounces of potash. Boil all together until the impurities from the sugar and salt rise to the top, skim, pour into a tub to cool and when cold pour over the meat. The meat should be killed at least 24 hours before packing and a very good way is to sprinkle with a little powdered saltpeter as soon as the meat is cut up—this removes surface blood.

Lard,

Leaf lard, skin carefully, wash, drain, cut into bits, put into a tin pail and set into a pot of boiling water. After melting, throw in a small quantity of salt to make the sediment settle, then *simmer* for half an hour or until clear. Strain through a coarse cloth into jars. Tie over bladders or paper and cloth, the latter dipped in melted grease. The other fatty portions, wash, drain, cut into bits and put into an iron kettle over a slow fire. Add a small teacupful of water, to prevent burning. When the bits of fat are reduced to fibers, take out with a skimmer. Watch constantly and toward the last stir constantly. The fire should be moderate from first to last. Sprinkle in a little salt, and when the fat looks clear, take from the fire and when cool enough, strain through a sieve or coarse cloth into jars. When straining lard, do not press the cloth as long as the clear fat will run through, and when you do squeeze it, strain that part into another jar. Lard keeps best in small quantities so it is well not to use over-large vessels. Keep closely covered in a cool, dark place.

Mary B.

Spiced Apple Pudding.

Three teacupfuls of bread crumbs, a pint of new milk, three teacupfuls of apples chopped fine, a teacupful of sugar, two well beaten eggs, a tablespoonful of ground cinnamon, a teaspoonful of mace, half a teaspoonful of ground cloves. Put the milk into a tin pudding dish, let come to a boil, stir in the bread and let soak before adding the other ingredients. Add the whipped whites the last thing. Bake 45 minutes. Eat with sauce. A. L.

Lemon Zest.

Rub loaf-sugar over the surface of lemons. The friction breaks the oil-ducts and the sugar absorbs the oil. Put into fruit jars in the lump or pound fine. Keep tightly corked. This is very fine for flavoring custards, creams, etc.

Coffee.

The best cup of coffee is made by using a mixture of two-thirds Java and one-third Mocha.

Delmonico is said to allow one and one-half pound of coffee to a gallon of water. The water is filtered through the coffee—it is not boiled.

Fried Mush.

This simple breakfast dish is much improved if the slices of mush are first dipped in beaten egg and then in cracker crumbs, frying in a mixture of lard and butter to a light brown. The meal should be thoroughly cooked and the mush allowed to become cold before slicing.

Cod-fish Balls.

Cut the cod into pieces, soak in luke-warm water for an hour or longer. Remove the bones and skin, shred, put over the fire in cold water. As soon as the water begins to bubble turn off and pour over cold water. As soon as it is hot it is done. While the fish is cooking make ready some mashed potatoes. Allow as much again potato as fish and mix together while both are hot—this last is particular. It does not make any difference if the balls are cold when fried, but they must be hot when the ingredients are put together.

Hop Bitters purifies the blood, and removes all pimples and eruptions.

Miscellaneous.

No Preparation on earth equals St. Jacobs Oil as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of **50 Cents**, and every one suffering with pain can have cheap and positive proof of its claims.

Directions in Eleven Languages.

SOLD BY ALL DRUGGISTS AND DEALERS IN MEDICINE.

A. VOGELER & CO.,

Baltimore, Md., U. S. A.

News of the Week.

HOME NEWS.

MONDAY, Nov. 1, 1880.

The Presidential election which takes place on the 2d, will be remarkable for being one of the most earnest and desperately contested elections in the history of the country. Also for the abandonment of the questions of State rights and sectional issues, and the adoption of vital questions relating to the internal development of the nation instead, and which promises to open one of the widest and most national fields of discussion yet brought before the people. The RURAL has carefully avoided any expression of opinion, in fact it has none whatever to express upon political questions. The material advancement of the nation, however, is one in which the farmers have a vital interest.... ....In the Vermont Legislature a long list of amendments to the State bankruptcy law was presented, making many important changes and including debts due persons out of the State in the general discharge. A bill was also introduced requiring that packages of oleomargarine be stamped, in letters one-half an inch long, "Oleomargarine;" and also that when retailed certificates stating the article to be oleomargarine must be given the purchasers. The fine for selling unbranded packages was placed at $100.....A man supposed to be R. P. Bull, a private detective, and formerly editor of the Democratic Press at Gainesville, Ark., has been murdered by an unknown man near Fort Worth, Texas. He was killed with an axe while asleep.....The will of the late Lydia Maria Childs gives $2,000 to the Hampton Agricultural College in Virginia, and distributes $9,000 more among half a dozen charitable institutions..... Owen Clancy, a teamster, was killed at Carrollton, N. Y., on the 27th, while unloading logs .....The steamer Trader, a small craft lying at her wharf at Memphis, was burned to the water's edge on the 27th.....The store and residence of Mrs. A. Burks, at Eagle Pass, Texas, was burned on the 25th. Loss, $10,000; insurance, $3,000.... An incendiary fire destroyed most of the business part of Augusta, Wis. The loss is $200,000.

There was turned out from the Grant Locomotive Works in Paterson, N. J., on the 25th, a new locomotive of peculiar construction, intended for the Pittsburg, Fort Wayne and Chicago Railroad. Eugene Fontaine, the inventor, claims that this locomotive can be made to go 90 miles an hour, while the machinery is run no faster than that of an ordinary locomotive traveling at the rate of 60 miles an hour. An incendiary fire in the factory of the Ansonia Clock Company at Brooklyn resulted in its total destruction, together with machinery and stock, involving a loss of nearly $1,000,000, upon which there was an insurance of $395,000. The insurance was divided between 95 companies, the policies varying from $2,500 to $10,000. The employes thus thrown out of work number 1,000. .....About a month ago Dr. P. H. Talbott, a prominent citizen of Maryville, Mo., and the editor of a Greenback paper published at that place, was shot through a window at his residence and killed while he was retiring for the night. On the 27th his son Albert was arrested for the murder, and Mrs. Talbott, the doctor's widow, and Ed. Talbott, another son, and a hired man named Weth have now been arrested as accomplices.....Patrick Dailey, a farmer living near Post Town, Butler county, N. Y., had a quarrel in a saloon at Middletown, where he was shot and instantly killed by Thomas Johnson, who escaped.....Hon. E. D. Mansfield died near Morrow, Ohio, at an advanced age. He has been widely known as a political and general writer for the Cincinnati and New York papers, over the signatures of "E. D. M." and "Veteran Observer."

John Duff, an eminent railroad contractor, especially distinguished as the builder of the Hannibal and St. Joseph and the Union Pacific Railroads, died at Jamaica Plain, Mass., of pneumonia. He leaves property estimated at $4,000,000 in value.... ....Michael Hendricks, said to be a nephew of Governor Hendricks, of Indiana, has been murdered near Leadville, Col. The guilty parties are said to be two McCallum brothers, as young Hendricks had been tried for and acquitted of the murder of their brother.....Mrs. Meaker, who, with her son, Almon, is in jail at Montpelier, Vt., under an indictment for killing little Alice Meaker, her husband's half sister, at Waterbury last spring, made a desperate and nearly successful attempt to burn the jail. She set fire to her cell, but the flames were discovered in time to prevent any serious damage.....Frank Allison, a merchant of Woodland, Carroll county, Va., had for some time suspected his partner in business, a young man named Hawks, of criminal intimacy with Mrs. Allison. He left home on the 28th, but unexpectedly returned at night and caught the guilty pair together, whereupon he shot and instantly killed Hawks, and then shot his wife in the breast and abdomen, inflicting fatal wounds. Hawks was 25 years old and Mrs. Allison was 33. Mr. Allison surrendered himself, leaving the dead and dying where he had shot them down. All the parties are well connected.....At Delphos, Ohio, on the 27th, Ella Salinde, eight years old, fell into a fireplace while putting on fuel and was burned to death..... Robert F. Johnson, for 25 years Editor of the Michigan Farmer, and widely known throughout the State died suddenly at Detroit on the 26th, it is supposed of heart disease..... John V. Farwell, senior partner of the firm of Farwell & Co., of Chicago, has filed a suit for libel against the Daily News for $50,000. The libel is understood to consist in an article reviewing the early history of Mr, Farwell's business life.....

H. T. Moore, an old citizen of Clayton county was killed on the 29th, near Jonesboro, Ga., by Thomas Betts, colored, in a dispute about the proceeds of a sale of cotton. Betts was arrested.... ....Mrs. Lincoln, the widow of President Lincoln, arrived from Europe on the 28th.....Lewis Green, colored, who had just sold his cotton at Giddings, Texas, was fatally shot and robbed by highwayman on the 28th .....The case of James B. Doyle, who was arrested by the Government officials at Chicago, with $204,000 in counterfeit United States bonds in his possession, came up before Commissioner Hoyne. Doyle waived an examination and held for trial in $30,000 bail.... ....At Little Rock, Ark., on the 29th, Jackson Greene was found guilty of murder in the first degree in killing Benjamin Borland on the 29th.... ....The lumber yard of J. T. Rodgers & Co., at Peoria, Ill., was burned by an incendiary fire. Loss, $30,000. Insurance, $16,000.

Unusual interest is taken in the selection of a site for the World's Fair to be held at New York in 1883, and the committee on sites has visited and examined all the proposed places and is now hearing arguments in favor of each, a decision is expected in a few days.

Two deaths from hydrophobia occurred on the 25th, Mrs. Kirby at Franklin, Ky., who had been bitten by a puppy last Summer, and Mrs. Augusta Schuler, a German woman residing at Addison, Ill. She was bitten by a mad dog about ten months ago, and on Sunday last symptoms of hydrophobia began to manifest themselves. She died in frightful paroxysms. She was over 40 years old and weighed about 220 pounds. The mad dog and about 15 other dogs which it had bitten were killed at that time.....The Chicago Tribune publishes a record of the ravages of the great storm of Oct. 16 on the lakes, showing that upward of $500,000 damage was done to vessels and cargoes, and that 93 persons perished. There were 17 total wrecks, involving a loss of $153,900, and in all 66 vessels were damaged to a greater or less extent.....The boiler of Jasper Smith's steam mill at Warrenton, Ala., exploded on the 27th, killing a man and a boy and seriously injuring several other persons, one of whom had his right leg torn completely off. The mill and a cotton gin were blown to pieces.... ....A fire occurred on the 28th in the three-story brick building on the corner of Howard and Lexington Streets, Baltimore. The loss is estimated at $25,000; insured principally in home offices.... ....A fire occurred at Bridgewater, Penn., on the 28th, destroying one frame and one brick dwelling. Mrs. Hempshill, 80 years of age, who was too feeble to help herself, perished in the flames. Two little boys, who were in the habit of carrying coal for the old lady, are also missing and are supposed to have perished.

Nov., 25th has been designated as a day of thanksgiving and prayer by the president..... Joseph B. Dixon editor of the Homer (N.Y.) Republican, was on the 29, run over on the railroad and was killed... ....Peter Wright, colored, was hanged at Liberty, Pa., for the murder of Robert M. Maupin, white, in June, 1879.....Deputy Sheriff George Heber was shot and instantly killed by Sylvester Merritt, at Sturgis, City, Col., on the 27th. Heber was the aggressor, and the killing was in self-defence.....William B. Spooner, formely a prominent merchant of Boston, died on the 29th aged 74. His charities are said to reach $700,000 notwithstanding which, and the loss of $150,000 by the great fire of 1872, he leaves a large estate to his widow and relatives.... ... The rotary bleacher and boiler in the G. and G. A. Robertson paper mill at Hinsdale, N. Y., burst on the 29th. The mill was completely ruined. Loss, about $200,000. Elbridge G. Blackmore was killed and George Leland and Frederick Fields were seriously injured.

The Chief of the Bureau of Statistics presents in his quarterly report for the last quarter of the year ended June 30, 1880, just issued, a statement showing the immigration into the United States during that period, from which we learn that the total number of immigrants was 457,257, of which there were from Great Britain and Ireland, 114,876; Germany, 84,638; Sweden, 39,186; Norway, 19,895; Austria, 12,904; Italy, 12,327; Denmark, 6,576; Switzerland, 6,156; Russia, 4,854; Hungary, 4,363; France, 4,313; Netherlands, 3,340; Poland, 2,177; British North American Provinces, 99,706 ... ... An early Winter and a very cold one, with a very heavy snow-fall, is predicted; the better for the springs and next season's crops.

A significant sign of the growing prosperity of this continent is to be found in the fact that it seems almost impossible to supply the demand for labor on the part of the Southern railroad companies. Application for large working forces are constantly received at Castle Garden, and quite a large number of immigrants are now being sent South, instead of being directed to the mining districts of the West .....The Southern Pacific will reach El Paso in a few days, and the line between San Antonio and that point is being run, while conferences of railroad officials at San Antonio look as if the Southern road were an assured fact.....Several flouring mills at Sherman, Texas, are to be converted into woolen and cotton mills. The uncertainty of the wheat crop in that locality, and the better chances for cotton and wool are the sufficient reasons for the change. .....The Gulf, Colorado and Santa Fe road is making over one mile per day laying track near Cameron. They are working about 200 hands at that point, and the bridge is now nearly completed. .....The Brazos division of the Texas and Pacific railway, with headquarters in Dallas, was formally opened on the 25th ult.

A sugar factory at Leavenworth, Kansas, was burned on the 29th. Loss, $75,000.....R. M. Mattison's flour mill at Fairbank, Minn., was burned on the 29th. Loss, $20,000.....Exports from Canada during September were $11,316,537; imports, $8,244,122, and duties, $167,504 .....Monumental cotton press, Union Dock, Baltimore, was burned on the 30th. Loss, $40,000, besides a quantity of cotton.....,The Tontine States at New Haven, Conn., were burned on the 31st.....Imports of merchandise into this country during september amounted to $93,200,000, against $44,200,000 same time in 1879. Exports for September of this year were $71,200,000 and last year $65,400,000. Increase of imports was 23½ per cent., and nine per cent. for exports. Imports of gold and silver for September were $19,700,000 and $28,400,000 last year. During the last nine months exports of merchandise have exceeded imports by $73,800,000..... Montana and Dakota are now reported free from Indian troubles, Sitting Bull and the leaders of the Sioux having surrendered to General Miles..... A serious Chinese riot is reported in Denver, Col., in which several persons were killed.....The residents of northern Michigan do not wish to have the deer exterminated. At the opening of the present season they advertised that hunters would not be welcome, and would probably lose their dogs if they came. Their request is disregarded, and the mortality among the dogs by reason of poison is greater than among the deer.

A short time since, while Wilmot Armstrong was building a dam near one of his camps in the vicinity of Trout Isle, Michigan, one of his men found a stone pipe, buried two feet under a cedar tree. The workmanship on it was said to be fine. The top of the bowl has a rim of brass, and the bowl has been cut into near the entrance of the pipe-stem, and a piece of brass fitted into it and from it to the stem, and rivited with brass rivets. .....Citizens of Fargo, Dakota are disposed to resist the payment of bonds voted to the Northern Pacific railroad, alleging that while the company has built the shops, as stipulated, it has not entirely fulfilled its part of the contract.....In digging a well at Plankinton, Dakota, last week, the workmen found a beautiful sea shell at the depth of eighty-six feet, and several well-preserved pieces of timber at 100 feet below the surface.... ....The annual product of the woolen manufactories of the United States is estimated at $288,329,000, and the dairy products at $350,000,000. Butter being an excess of consumption, the balance has to seek a foreign market, while the production of wool being far below our consumption, we are annually importing large quantities.

Wolves are committing serious depredations in Otter Tail and Jackson counties, Minn. John Dolan, of Kimball, who had a flock of over a hundred sheep, lost so many by the wolves that he felt compelled to sell the rest.....Business in Atchison, Kansas, has reached a pitch of prosperity never known before. Last year there were seven brick yards, and this year nine brick yards cannot supply the demand.....Near Fair Haven, Stearns county, Minn., some days since, a man while working around a home-made sorghum mill was caught by the "sweep," to which a yoke of cattle was attached, and had his head crushed against a stick of upright timber. He fell dead instantly..... A Stillwater, Minn., lumber firm have already sent a large number of men, besides 140 horses and 50 oxen, to their various lumber camps. The firm expect to get out about 45,500,000 feet of logs this Winter. Their last Winter's crop was 27,000,000.

[Logansport, (Ind.) Daily Journal.]

I sell more of St. Jacobs Oil remarked Mr. D. E. Pryor, 112 E. Broadway, to our reporter, than of any other article of its kind, and I consider it the best liniment in use. It has to my own knowledge cured severe cases of rheumatism in this community.

FOREIGN.

Affairs in Ireland are fast coming to a crisis, and rebellion or revolution, leaving the background, is coming rapidly to the front. The government has prepared indictments against half a dozen leaders of the Land League, having abandoned the wholesale prosecution it was at first reported it contemplated. The head and front of the agitation is Parnell, against whom political wrath is hottest. Less of an orator than O'Connell, he is more of a revolutionist, and the question of the hour is whether he will submit quietly to prosecution or raise his followers. Monstrous mass meetings are still being held here and there among the farmers, but up in Protestant Ulster counter-meetings begin to be held, by the Orangemen chiefly. Threats and occasional outrages are still the order of the day. Never have the peasantry throughout the island been so thoroughly armed, while a large part of them have been drilled considerably by night, chiefly by ex-soldiers from this country. In England public opinion strongly favors prompt coercive measures; and in case of rebellion the movement is sure to be suppressed promptly, but the "Irish Question" will still remain to be settled—and to that question the attention of the whole world has now been forcibly attracted.

Great Britain's position just now is not a comfortable one. While bent sternly upon suppressing Irish revolt with a strong, aye, and a cruel hand, she has for years been encouraging revolt in every country in Europe. While on the alert to go to war to keep down the Celts at her own doors she seems resolved to go to war to free the Slavs under the Turkish yoke, and away in Afghanistan her efforts to subjugate the natives seem futile, for by last reports the whole country was once more in a state of anarchy, Abdurrhaman Khan, having been killed at Cabool, and all the tribes having once more taken up arms. There is some comfort in the lack of confirmation of this news, since, if true, either Afghanistan must be reconquered, or the British must withdraw and suffer a serious loss of prestige not in India alone but throughout all Asia and elsewhere. Fresh troubles have broken out in South Africa, too. No sooner have the Zulus then been conquered than the Basutos have burst into revolt, killed a number of magistrates and missionaries and threaten the colonists. Owing to the vast extant of the British Empire, not a year passes without war and its horrors devastating some part of it.

There are rumors that the Tzar is dead—poisoned, it is said, by the Nihilists. The reports are contradicted, however, but it is said he is very sick and may die at any moment. Gen. Loris Melikoff, chief of the Russian executive government, who has lately been at Lividia with the Tzar, has returned to St. Petersburgh, having obtained authority to begin a large number of reforms in the administration, among which is a great deal more freedom for the press. Meanwhile, the condition of the Russian peasantry is said to be growing more deplorable every day, what with heavy taxes, short crops, widespread drunkenness and general demoralization.

Dulcigno was to been have surrendered two weeks ago; it is not surrendered yet. Those Turks beat the world in procrastination. It's excellent diplomacy, however, for by their manœuvering they have already put an end to the concert between the Powers, dispersed the fleet that was to make a demonstration against them and so wearied the world with their promises and want of faith that folks are getting disgusted with the whole thing. If it costs so much trouble to obtain the surrender of the miserable little village of Dulcigno to the Montenegrins, whose claim to it is pretty strong, how much more will it cost to force a cession of the very much larger territory demanded by Greece for much less valid reasons? In fact, England and Russia alone, still "stick up" for the Hellenic claim. There is a better prospect just now that the Montenegrins will be soon satisfied. Riza Pasha, who has hitherto delayed matters in that quarter, has just been replaced by Dervich Pasha who is authorized to arrest the Albanian chiefs who resist the cession of the town and to send them on board a Turkish man-of-war. About 10,000 Turkish troops are being concentrated at Dulcigno to effect its surrender—but it seems to us it will be some time yet before this is done, unless Great Britain and Russia insist peremptorily on it, and back up their demand by actual force.

In France, the commotion about the government's harsh treatment of the religious orders is increasing in bitterness and extent. Even in this country the summary expulsion of the few assemblies of Catholic religious orders, scarcely known to the general public, would cause some excitement, how much more in France where monasteries and houses of these orders are much more numerous, while the members are known in every corner of the country, and control a large share of the schools and seminaries. Unlike the Jesuits who submitted quietly, the two religious societies whose members have been driven from their homes during the past two weeks, barracaded their dwellings against the police who had to expel the recusants by force every time. This, of course, intensified the public excitement. The government, however, seems firmly resolved to carry out the anti-clerical decrees, and refuses to receive any petitions against them.

The Earl of Beaconsfield is suffering from gout in the tongue.....Heavy rains continue in England. Floods are reported from various parts of the country. A portion of the railway between Dublin and Wicklow is washed away. Incoming vessels report terrific weather on the Atlantic during the past few days. .....It is said that Kurds are firing into the town of Urumiyah, northern Persia. The town of Khoi, in the same province, is also threatened by them. Another body of barbarians destroyed Mahmudjet, two miles from Fainkaleh. Reinforcements of Persian troops are on the way to Teheran, and are a week's journey from Sainkaleh.....The text of the speech of the king of Greece at the opening of the chamber of deputies, the 21st inst., shows it was much more moderate and restrained in tone than appeared from the telegraphic summary. The king represents the necessity of maintaining an army on a war footing, rather as an obligation entailing heavy charges than as a menace of immediate action.

Mr. George Knoehr after having tried all remedies recommended to him for Rheumatism, received no relief until he tried the St. Jacobs Oil, the first application of which gave him relief, and the continued use cured him.

AGRICULTURAL NEWS.

Of the disposals of public land during the twelve months ending June 30, 1880, there were homestead entries, 6,045,570 acres; timber-culture entries, 2,193,184 acres; cash entries, 850,740 acres, total area of public lands surveyed since the beginning of the surveying operations until the date above given, is 752,557,195 acres, leaving still unsurveyed an estimated area of 1,062,231,727 acres. It is estimated that 1,500,000 baskets are used in the South for harvesting a crop of cotton. These are made of oak splits and generally last but one year. They cost the planters about $2,000,000. At a recent brewers' exhibition in England, good beer was shown brewed from maize and rice. The probability of American maize supplanting English barley is suggested.....The president of the Massachusetts agricultural college, Levi Stockbridge, has accepted the congressional nomination of the Greenbackers in the 10th district of Mass.....The wool clip of the world has increased five times since 1830, when it was about 320,000,000 pounds in weight, in 1878—the latest year for which there are complete figures—Europe produced 740,000,000, River Platte 240,000,000, United States 208,000,000, Australia 350,000,000 and South Africa 48,000,000 pounds, making a total of 1,586,000,000 pounds. Great Britain and France consume each about the same quantity of wool—380,000,000 pounds a year. Germany consumes about 165,000,000 pounds; United States 250,000,000 pounds; and Russia, Austria and other countries, 400,000,000 pounds.....

It will cost the cotton planters about $40,000,000 to market their crop this year, of which $25,000,000 will go into the pockets of colored laborers, many of whom are women and children.....The quality of sorghum juice grown in Western Kansas is superior, owing to the long and sunny season. A very extensive sorghum and sugar factory has just been put in operation near Larned. The owner has 700 acres of sorghum, which will give employment to a large number of hands.

Columbus, Miss., with a population of 7,000, offers $2,000 to have the next exhibition of the Mississippi Valley Horticultural Society held here. ..... Iowa's standing among her sister States is

said to be as follows: first in corn, second in hogs, and third in wheat.....The raising of horses in the great Yellowstone Valley has become an important and profitable business. Some of the herders have from 500 to 1,500 each, and dispose of their three-year-old colts at from $50 to $100 per head. The animals feed on grass alone, and the only shelter from the weather is roughly built sheds.

Butter-Making in July and August.

Butter-making can be carried on in hot weather as successfully as in June by using the Gilt-Edge Butter-Maker. It reduces time of churning one-half, increases production six to ten per cent. Storekeepers pay three to five cents a pound extra for butter made with it. Sold by druggists, grocers and general storekeepers. Send stamp for "Hints to Butter-Makers" Address, Butter Improvement Co., Buffalo, N. Y.

OUAQUAGA DAIRY, SUSQUEHANNA VALLEY, N. Y., May, 28, 1879.

BUTTER IMPROVEMENT CO., Buffalo, N. Y.:

Gentlemen—Please accept a sample of butter made from "hay-fed" cows and with the use of your Gilt-Edge Butter-Maker; without its use the butter made was almost as white as lard, while with its use (as you will observe from the sample sent you) the butter is of a very beautiful, even golden color leaving nothing to be desired in that direction. Several of my neighbors, dairy farmers, have tried your powder and are loud in its praise. It passes in market as "creamery butter" and is worth from three to five cents per pound more than dairy butter. H. C. BRYANT.

Let the poor sufferers from female complaints take courage and rejoice that a painless remedy has been found. We refer to LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It is prepared at 233 Western Avenue, Lynn, Mass. Send to Mrs. Pinkham for pamphlets. Sold by druggists.

Tropic Fruit Laxative, an agreeable substitute for pills and nauseous purgatives. One lozenge is the dose. Physicians prescribe it. Sold by druggists.

We know that there is nothing on earth equal to Hop Bitters as a family medicine.

Industrial Notes.

Improvements have been made in nearly every branch of manufactures during the past few years, but in none, perhaps, to a greater extent than in that of salt. The invention of Thomas Higgin, of Cheshire, England, some four years ago, marked a new era in this industry, and it is considered that this process will work as great a revolution in the salt trade as the discovery of the Bessemer process has in that of steel. As an illustration of how quick Americans are to appreciate an improved article, the annual imports of the new-process-salt have increased in four years from 6,000 to 90,000 sacks.—American Grocer.

The constantly increasing sale of BURNETT'S COCOAINE, confirms the opinion of the best judges, that it is equal, if not superior, to any domestic or foreign. It also received the highest award at the Centennial Exhibition.

The Markets.

SPECIALS FROM THE CHIEF CENTERS

Until Saturday, Oct. 30.

Boston.—BUTTER.—Prices not improved, and except for fine grades they are more or less nominal. Northern, choice creamery 30@32c. per pound; choice New York dairy, 27@28c; choice Vermont 28@30; long dairies 22@24c; common 16@18c. Western choice creameries 29@32c; fair to good 26@28c; dairy-packed 20@25c; choice ladle-packed 19@22c; common 16@18c. CHEESE. Prices are firm, and we quote at 13@13½c. for good, and 11@11½c. for fair lots, but not many cheeses are offered below 12c. Northern factory, fine 13@13½c; western factory, fine 12½@13c; fair to good 11@12c; common 8@10. Vegetable and Domestic Fruit. POTATOES.—Prices remain at 40@45c. for white stock, and 50@55c. for Rose, the latter price for Houlton. Sweet potatoes are firm at $2 for prime ones, and $1.50 for culls and stock in fair condition. There are not many native onions offering, and the market is supplied mainly with New York State, which range from $3@3.25 per bbl. There is a good shipping business for apples, although it is not so brisk as a few weeks ago. Grapes are plenty at 3c. for Isabellas and 5@6c. for Catawbas. There is a good supply of cranberries, and prices range from $3@4.50 for country berries, and $5@6 for Cape. Quinces are dull at $2@5 per bbl. There is a fair supply of chestnuts that sell from $2.50@2.75 per bushel.

Chicago—WHEAT active, firm; No. 2 Red Winter, $1.02¼; No 2 Chicago Spring, $1.01⅝@1.01⅞, cash; $1.02. November; $1.03⅛, December; No. 3 Chicago Spring, 91½@93c.; Rejected, 74@76c. CORN active, 39½@39⅝c., November; 40¼c., December; 45⅜c., May. OATS dull, 28⅜@28⅝c., cash; 29c., November; 30½c., December. BARLEY easy at 85@90c. PORK unsettled; $18.50 cash; $12@$12.15, November; $12.12½, December; $13 50 bid, January. Lard active, and firm, and higher; $8 05@8.07½, cash; $8.02½@8.05, November; $8 asked, December; $9 bid, January. Bulkmeats moderately active and higher; Shoulders, $5.70; Short Rib, $7.45; Short Clear, $7.60.

BUTTER—Fine goods were not very plentiful and were held with confidence, but low and medium grades were easy. Creamery, 27@30; Dairy, choice, 24@25; Dairy, fair to good, 22@23; Ladle packed, 17@20; Packing stock, 13@15; Grease, 8@10. CHEESE—Full cream, September, 12¾@13¼; Full cream, August, 12@12½; Part skim, September flat, 11½@12; Part skim, July and August, 10@11; Full skim, 8@10; Low grades, 6@8. HOGS active; good, scarce; common to good mixed packing, $4.40@4.60; choice heavy, $4.70@4.85; light, $4.50@4.70, closing strong at 10c. higher. CATTLE—good to choice shipping, $4.60@5.15; common to medium, $3.80@4.25; butchers' steady at $2@2.90; feeders, $3@3.50; Westerns strong; half-breeds and natives, $3.25@3.50; Texans, $3@3.20; through Texans, $2.90@3.10.

Cincinnati.—WHEAT scarce and firm; No. 2 Amber, $1.02; No. 2 Red Winter, $1.00. CORN—Demand fair and market firm; No. 2 Mixed, 43½c; New ear, 35c. OATS dull and lower; No. 2 Mixed, 31c. RYE in fair demand; No. 2, 90c. BARLEY in fair demand; No. 2 Fall, 90c. PORK quiet; jobbing lots, $15; 500 bbls. at $20. LARD stronger, $8,05@$8.10. Bulk-meats quiet; Clear Rib, 7¼c. Bacon in fair demand; Shoulders, 5¼c; Clear Rib, 8¼c; Clear Sides, 8½c. BUTTER—Fancy Creamery sells at 30@31c, and prime at 27@28c, choice Dairy at 23@25c, choice Western Reserve at 23@25c, prime to choice Central Ohio at 18@22c, common at 15@16c and inferior at 10@13c ₩ lb. CHEESE—There has been a moderate demand and a steady market with prices closing firm for choice mild factory at 13@13½c ₩ lb, and some good to prime but rather sharp do. sells at 12@12½c.

St. Louis, Mo.—WHEAT firm; No. 2 Red Fall, $1@1 00⅝, cash; $1 00½@1 00⅝, November; $1 03¼@1 04⅛, December; $1 05¾@1 06¼, January; No. 3 do, 93@93½c; No. 4 do, 88@88½c. CORN lower at opening, but advanced to 38⅜@39½c. cash; 38¼c. October; 39½@39⅝c. November; 39¾@39¾c. December; 39⅝@39⅞c. January; 43⅛@44c. May. OATS slow at 29⅜@29½c. cash; 29⅝@29¼c. November; 30¼c. December. RYE firm at 83½c. BARLEY steady at 90@95c. PORK lower at $14 for new. Lard nominally 7¾c. Bulkmeats steady and unchanged; Bacon firmer; Shoulders, 5½c; Clear Rib, $8 70@8 75; Clear Sides, $9 05@9 15. BUTTER: Choice grades in steady local demand and firm; near-by country make in pails sells fairly, but other descriptions quiet and weak in price. Creamery, 29@31c.—latter for selections; Dairy, selected, 25@26c; prime, 18@20c.; medium, 13@16c.; common, 12@13½c.; country in pails sells fairly at 11@12c. for ordinary to 15@17c. for sweet yellow, and in rolls at 14@16c.; choice Northern roll at 18@20c. CHEESE easy; full cream, 13@14c.; part skims, at 11c. for fair to 12@12½c. for prime mild; poor and skims, 4@8c. GRASS SEEDS unchanged; offerings light and of small and poor lots. Red-top at 40c. for poor to 47½c. for prime; Timothy at $2 25@2 35—latter for prime in car lots; clover at $4 55@4 60; Hungarian and millet nominal, prime of each at 50@52½c. Sales, 50 sks. Hungarian at 45c., 41 red-top at 42c. East track, 20 trashy timothy at $2 20. Flaxseed steady, with sales of three cars at $1 18 on basis of pure and one car on p. t. Hogs steady; Yorkers and Baltimores, $4 50@4 60½; mixed packing, $4 40@4 50; butchers' to fancy, $4 50@4 65.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 30, 1880.

BEANS AND PEAS.—The demand for beans is steady at good, full prices for new. Old in fair demand when prime. Choice green peas scarce and firm; new quoted at $1 90@1 95 for prime Wisconsin Southern B. E. peas a shade stronger; $1 50@1.85 per ⅞ bush. bag,

Marrow beans, new, $1.75; old, $1.52@1.65; medium, new, $1.50@1 55; old, $1.35@1.40; pea, new, $1.55@1.75; W. kidney, new, $1.65@1.80; red kidney, new, $1.40@1.70; black, or turtle soup, 1.55@1.60. California sends 3,000 bags beans this week.

BEESWAX.—Trading is moderate, with Western and South-rn quoted at 23½@24½c. Exports for week, 12 500 lbs.; since Jan. 1st, 80,000 do.; same time last year, 85,800 do.

BUTTER.—The market has the unpleasant phase of a one-sided demand. All buyers of State expect some Fall-fair red grade, when they pay above 24c. for tubs or pails. Under grade creamery closes with other packages. Fortunately the offering now includes a better showing of nice useful table stock and most of the small buyers—and small buying is the rule as yet—can be accommodated without sellers being compelled to resort to the bad practice of breaking into fine dairies. Fine creamery holds up to the last rates as there is no surplus of choice. As before medium butter has to take its chance with perfect oleomargarine. Manufacturers of that product seem delighted with the stubborn holding views that have prevailed among farmers of late. Western also helps substitutes, as it rules too high for the common use of cheap retailing prices and much of the market trade. Welsh tubs are scarce and wanted. Exporters have bid 24c. for firkins and the full rate for best Welsh, good to prime factory fill all present wants of Western for export use.

Creamery, fine State and Western, 31@32c.; good to prime, 28@31c.; poor to fair, 23@26c.; sweet cream, 24@29c.; State entire dairies, choice, 25@26c.; other, 23@24c.; firkins, fair to choice, 21@25c.; State pails and half tubs, fine fresh, 28c.; good to prime, 26@27c.; fair to good, 24@26c.; poor, 21@23c.; Welsh tubs, fine fresh, 27@28c.; poor to good, 20@25c.; Welsh tubs, fine, fresh, 27@28c.; poor to good, 20@26c.; do. dairy, fresh, 23@25c.; poor to good, 16@21c.; factory, June, 17@19c.; current make 19@20c., poor to good, 15@18c.

Receipts for week, 29,310 pkgs.; exports do., 6,950 pkgs.

CHEESE.—The arrivals have been larger, the demand quieter on account of tame foreign advices, and prices easier. Shipments for the week 33,900 boxes. Quotations are for

State factory, fancy, at 13c.; do. good and prime, 12½@12¾c.; do. fair to good, at 11@12c.; do. part skimmed, 9@10½c.; Wisconsin factory, fine, 12½@12¾c., do. good to prime, 12@12½c.; do. fair to good, 10½@12c.; Ohio factory, fine, 12½@13c.; do. good to prime, 11½@12c.; do. flat, fair to good, 10@11½c.; do. poor to fair, 7@10c.

Receipts for week, 67,571 boxes.
Exports for the week, 33,900 boxes.
Liverpool cable, 63s. 6d.
Steam to Gt. Britain, 35@36s.

COTTON.—Export demand has been good and prices closed firm. Latest prices are for

October at 10.36@10.38c.; November at 10.61c.; December at 10.81c.; January at 10.92@10.93c.; February at 11.06@11.07c.; March at 11.21@11.22c.; April at 11.36@11.37c.; May, 11.50@11.51c.; June at 11.63@1165c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

White clover comb, single pkgs. 17@18c.; larger pkgs 15@16c.; buckwheat 12@13c.; extracted, as to color, 8@12c.

HOPS.—Demand is more active, including about 1,200 bales taken for export within a week and prices closed steady. Quotations are

	Cents per lb.
New Yorks, crop 1880, prime and choice	20 @23
Do. medium	18 @20
New Yorks, crop 1880, low to fair	16 @17
Eastern, crop 1880	16 @20
Wisconsin, crop 1880	16 @20
Yearlings, crop 1879, choice	16 @23
Olds, all growths	4 @12
Bavarians	30 @35

Receipts liberal, 3,831 bales for week.

OIL CAKE.—Western is quoted $33 per ton.

POULTRY AND GAME.—Supplies are enlarging and prices are making a cool weather movement; that is, inside rates are mostly quotable for wholesale parcels. The additions at present mostly State. Turkeys have opened in demand.

Turkeys, State and Western, choice, 12@13c.; fair to good, 11@12c. Phila., dry-picked, 14@15c. Chickens, &c., 13@15c.; Bucks Co., 14@15c., State scalded, 11@12½c.; Western, do., 10@13c. Fowls, Phila., dry-picked, 12@13c.; N. J., do., 12@13c.; scalded, 10@11c.; State, do., 10@11½c.; Western, do., 10@11c.; poor to fair, 9@10c. Ducks, Spring, 12@15c.; mixed Western 12@13c. Geese, Phila. 10@15c.; fair to good, 8@9c. Squabs white, ₩ doz., $2@2.25; dark, $1@1.25.

Receipts of live are heavy, and as they meet a fairly large offering of dressed prices have seriously declined. From this time out cooped stock will have a more precarious sale.

Fowls and chickens, N. J., 9@10c.; State and Penn., 8@9c. Western, 7½@8c.; Southern, 7@8c. Roosters, 4c. Turkeys, N. J., 10c.; Western, 8c. Ducks, choice, 6½@7c.; other, 40@60c. Geese, choice, $1.75; other, $1@1.50. Pigeons, 25@35c.

The game market is well supplied and prices are fairly good considering the season. Quail will be in next week; expected to open at $2.25. Supply of wild ducks mostly Western. A few Western flight pigeons quoted 75c. ₩ doz. Venison has improved.

Canvas back ducks ₩ pair, $1.25@1.50; red heads, 40@60c.; mallard ducks, 20@40c.; teal, blue winged, 30@35c.; green do., 20@25c; partridge, prime, $1@1.12; Western, 85c.@$1; Eastern, 50@80c. soft, 30c. Grouse, prime, $1, soft, 30c. Woodcock, State, 40@60c. Eng. snipe, ₩ doz., $1.62@1.75 sand snipe, per doz., 40.@60c. Plover, $1.62@1.75. Venison saddle, Minn., 15@17c.; other, 13@15c. Whole deer, 10@11c.

PROVISIONS.—Hog products have been in demand and are higher, mess for export at $15@15.50. Bacon at 7¾ for long clear. Beef hams at $16 75@17. Beef at 18.50@19 for city. India mess $9.50 for extra mess and $8 50 for plain mess. Lard, Western steam at 8 70@8.75 for spot lots; 8.50 for November; 8.40@8.42½ for December.

SEED.—Clover is quiet at 8½@9c. Timothy has little demand, quoted $2.70@2.80. Flaxseed quoted at $1.40.

Receipts for the week 1,630 bush. Exports, 265 bags.

TOBACCO.—The market has not shown important change, with business moderately active.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Oct. 30 1880.

BEEVES.—Receipts for the week 12,730 head; do. last week, 13,440 do. With unfavorable weather and a depressed meat market there was a slow, dragging demand for cattle. Good to prime native steers are in light supply and sold fairly at steady prices. Common to fair stock, which largely composed the offering, compared with Wednesday, declined $1 ₩ head and ½c. ₩ lb. Texas and Colorados were scarce; sold at 7¼@8¼c respectively. Large droves of Ohio, Indiana and Kentucky sold at 7@8¼c., to dress 57 lbs.; good to choice sold at 9@10¼c., to dress 56 lbs Some Eastern Illinois steers sold at rate equivalent to 11¼c.

COWS AND CALVES.—Supplies have been small and have contained no prime milkers. The range is quoted $25@50 common to good. There is no inquiry for extras, and a bid would probably not exceed $55 or $60.

VEAL CALVES.—Supplies large and common have a slow sale. Prime live or dead quoted to all the market will bear.

Live calves, N. J., fed, 7¼@7¾c., State, 7@7¼c.; fair to good, 6½@6¾c.; poor, 5@5½c.; Mt Holly, heavy, 4@5c.; light, 6½@7½c.; buttermilk, 3@3½c.; grassers, 1¾@2¾c.; dressed choice fed, 10@10½c.; fair to prime, 8@9½c.; common, 3@5½c.

SHEEP AND LAMBS.—Receipts for week, 32,344 head; do. last week, 37,428 do. Heavy wethers were in good demand and firm; other grades slow. Some of the pens were overstocked, and anything under prime closed weak. Sheep, poor to prime, 4@5½c.; extras, 5¾c. Lambs ranged 5¾@6c.

SWINE.—Receipts for the week, 46,187 head; do. last week, 41,186 do. Live hogs, $4.75@5.00 per 100 lbs. corn fed; dressed N. J. heavy pigs, 5¾@6¼c. per lb.; light, 6¾@8c.; city dressed State, 5¾@8c.; do. Western, 6@6½c.; pork tenderloins, 11c. in boxes.

Reading for the Young.

FROST-TIME.

How small a tooth hath mined the seasons heart;
How cold a touch hath set the wood on fire,
Until it blazes like a costly pyre
Built for some Ganges Emperor old and swart,
Soul-sped on clouds of incense! Whose, the art,
That webs the streams, each morn, with silver wire,
Delicate as the tension of a lyre?
Whose falcion pries the chestnut burr apart?
It is the Frost a rude and Gothic sprite,
Who doth unbuild the Summer's palaced wealt
And puts her dear loves all to sword or fight;
Yet in the hushed, unmindful Winter's night,
The spoiler builds again with jealous stealth,
And sets a mimic garden cold and bright.

FARMING FOR BOYS AND GIRLS.—NO. 2.

HENRY STEWART.

The Soil, What It Is.

ALL forms of matter or substance which exist, in whatever shape they may present themselves to our view, whether in rocks, soil, the air, water, or in the bodies of animals or in plants, are divided into two classes, viz: inorganic and organic. These are to be distinguished as dead and living matter; the one is without life and does not grow or increase its substance, and the other grows and is continually changing its form; it is called organic because it is organized, by which is meant that it consists of certain structures, the forms of which are visible to sight and are continually changing. These organic substances are all derived originally from inorganic matter, such as the soil, water and the atmosphere. The soil, in the form in which it is found in fields and gardens, or in any condition in which it produces vegetation, consists of inorganic and organic substances mixed together. The inorganic particles of the soil are derived from the solid rocks, of which the earth has been once, or is now, composed. These have been broken up and are being broken up every moment, but slowly, into small fragments by the agency of air and water chiefly, and are capable of being slowly dissolved in water. The organic particles of the soil consist of the remains of animal and vegetable matter which have decayed and have returned again to their original element. Although this organic matter may have lost its structure and form, and has become mixed with the mineral parts of the soil, it is still considered to be of organic origin. Thus when manure is added to the soil, in course of time it decays and is lost to sight; its remains are mingled with the soil in which they become food for a new growth of vegetables, which in turn become food for animals, and in turn everything which comes from the soil goes back to it in some form or manner. The soil produces plants; these plants furnish food to animals in part and in part remain and decay in the soil; in time animals die and their bodies go back to the soil either directly or indirectly. Thus there is a ceaseless round of change always going on which we can trace very distinctly, and the soil is the great storehouse from which everything comes and to which everything returns.

The inorganic parts of the soil which are of the most interest to us are those which are used by plants as food, and which we can trace in the plants. These are lime, potash, soda, magnesia, silica, alumina, phosphorous, carbon, sulphur and iron, which are solids, and oxygen, nitrogen, chlorine and hydrogen, which are gases.

But these substances do not exist in the soil in a free or pure state, but are combined one with another in various ways; for instance lime, potash, soda, magnesia and alumina are oxides of different metals; that is to say that these metals are combined with oxygen and in this condition appear as the commonly known substances named. Again, most of these oxides are combined with carbonic acid and form carbonates; soda may lose its oxygen and combine with chlorine forming common salt; phosphorus, sulphur and carbon combine with oxygen and form phosphoric, sulphuric and carbonic acids, each of which are most important and interesting substances in the growth of plants; silica is a compound of silicon with oxygen; water is a compound of oxygen and hydrogen; the air is a compound of oxygen and nitrogen; and ammonia another substance of the greatest importance to plant growth, is a compound of nitrogen and hydrogen. A compound is such a mixture of two substances as produces by the combination, a new and different substance forming a perfect union in fact; while a mixture is only the mingling of particles without combination, as sand may be mixed with sugar, but the two do not form a union. Thus the inorganic part of the soil is a remarkably intricate combination of a large variety of substances and not, as might appear, a simple substance which merely serves to hold the roots of plants. The organic part of the soil is of equally intricate composition and the two mixed together form the material which the farmer plows and sows and from which he gathers his crops. The soil is slowly soluble in water and only furnishes food to plants when thus dissolved. A plant cannot live without water; this we know; but it cannot live and grow unless the water contains a certain supply of the substances of which the soil consists, and these substances taken from the soil in the water which plants absorb are called plant food. It is easy to see that so long as the soil contains plenty of these food substances in a soluble condition the farmer will have no trouble in growing bountiful crops; also that if the soil is not able to supply them, it becomes poor, and profitable crops cannot be grown. Therefore, as the soil is deprived of a portion of these substances by every crop that is grown, it is the business of the farmer to supply the loss, and enrich his soil continually by manure and by cultivation, so as to enable it to produce crops that can yield a reward for labor.

THE BANK SWALLOW, OR, SAND MARTIN.

MAUDE MEREDITH.

I wonder if the little readers have been interested in our talk about birds? And if they would like to know something about the bird-folk that live in the little tunnels they may have seen in some deserted gravel bank, or river shore. The Bank Swallow, Hirundo Riparia, closely resembles the other members of its family, but though being the most social among themselves, are the least intimate with man. On high sandy river banks, or, what better pleases them, the sides of deserted gravel-pits, they scratch out and bore holes from one to two feet deep, in which they build their nests. The powers of this pretty bird would seem to be quite inadequate to the arduous labors which it performs with such apparent ease, and few would suppose, after contemplating its tiny bill, that it was capable of boring tunnels into tolerably hard sandstone. But such is the case, for Sand Martins have been known to drive their little tunnels into sandstone hard enough to destroy all the edge of a knife. Yet, like all little folks, he does not *prefer* a hard task to an easy one, and can he find a loose sandy soil, yet quite firm enough for solid walls to his little domicile, he will choose it, or the sandy intervals between layers of stone, where the work is comparatively easy. It often tries and abandons several localities as being too hard, but when it discovers a suitable place sets to work earnestly, working in a circular direction and using its legs as a pivot, and by dint of turning round and round as it works, succeeds in forming a tolerably circular cavity.

The tunnel in all cases slopes gently upward to prevent the rain from flowing in. At the farther extremity of the burrow, which is always rather larger than at the entrance, is placed the nest, a very simple structure, composed of dry grass lined with a few soft feathers, where the eggs, usually five in number, and pure white in color, are deposited.

Few foes can molest the nest or little ones until old enough to venture out of their strong fortress, when an army stand ready to swoop down upon them. The crow and magpie wait at the entrance of the holes in order to snap up the young on their first appearance in public, and if escaping these enemies, while first attempting to fly in little crowds, the kirtsel and sparrow-hawk sweep suddenly down carrying dismay and desolation among the little flocks. And with sorrow I must admit that boys are sometimes enemies of these little creatures, considering it great fun to dig out their nest. In some places there are rules against molesting the swallow, as they are so useful in destroying flies and bugs. I read an account of one gentleman who took about a gill of the hard outer wings of the cucumber bug from a single Martin house, after the birds had migrated. Think of the busy little fellows as gardners! And the length of time it would take a little boy to rid the cucumber beds of so many of the striped pests.

The Bank Swallow is always in advance of others of the same species, arriving in any given locality so early in Spring as often to encounter cold storms and rough weather; at which times they take refuge in their holes and huddle together for warmth, coming out again in clear weather, so benumbed as to give rise, among some, to the belief that the swallow hibernates, but this is not a fact, as search in their houses through the winter months, fails to discover any birds. The Bank Swallow is five inches long, and two in extent; upper part mouse colored; lower, white, with band of dusky brownish across upper part of the breast; tail forked, the exterior feather slightly edged with white. They seem to enjoy a visit to the seashore, where they go in great numbers, previous to their departure South, which occurs about the 20th of August.

"O'er fell and fountain sheen,
O'er moor and mountain green,
O'er the red streamers that
Herald the day:
Over the cloudlets dim,
Over the rainbows rim,
Musical cherub, soar, singing away!

Then when the gloaming comes,
Low by the heather blooms,
Sweet will thy welcome and bed
Of love be!
Emblem of happiness,
Blest is thy dwelling-place—
Oh, to abide in the desert
With thee!"

BEARS AND HORNETS.

HORNETS build their nests high up in the branches of trees, or fasten them to rocks out of reach of harm. But cunning as these insects are, they are no match for the bear. A bear discovers a hornets nest far out on a limb too small to bear his weight or high up on the breast of a rock. If the former, he climbs the tree, breaks off the longest branch he can get, and holding it in his fore paws thrashes the nest until it drops to the ground. Sometimes he dances or stamps on the limb until the nest is shaken off. If the nest is on a rock, the bear goes up to the top of the ledge above it. Then he gathers large stones and pieces of wood and rolls them down the side of the rock until one strikes the nest and sends it tumbling to the ground below. The hornets seem to know what has caused their ruin, and not one of them deserts the fallen nest, but all seem to await the appearance of the bear, when they attack him at once. "A hornet sting," says the old hunter, "is equal to a blow from a sledge hammer every time, and one hornet'll knock a bull down. But their bite won't raise a lump as big as a buck shot on a b'ar, and the shaggy creature seems to think it's a heap o' fun. He'll stand up on his hind legs and square off with his fore paws at the hornets, jest as if he was boxin' with somebody, only he's durn careful to keep his eyes shet. Then he'll lay down and roll all over the rest, as if he wanted to show the hornets how he didn't care no more for 'em than as if they was gnats. Once I see a big she b'ar, which had knocked a hornet's nest as big as a peck measure off'n a tree, take it under her arm and walk off with it as coolly as if it was one of her cubs."

WHAT A NATURALIST SAW.—An English naturalist, while preserving an tsand spiders in bottles of alcohol, met with a touching exhibition that caused him to forego further experiments. He wished to preserve a large female spider and twenty-four of her young ones that he had captured. He put the mother into a bottle of alcohol, and saw that after a few moments she folded her legs upon her body, and was at rest. He then put into the bottle the young ones, who, of course, manifested acute pain. What was his surprise to see the mother arouse herself from her lethargy, dart around and gather her young ones to her bosom, fold her legs over them, again relapse into insensibility, until at last death came to her relief, and the limbs, no longer controlled by this maternal instinct, released their grasp.

LETTERS FROM THE COUSINS.

UNCLE MARK:—Will you please let me join the Horticultural Club? I am twelve years of age, and live in the north woods of Michigan. We came here in June, so that I could not have a garden this Summer, but I intend to have one and plants next year, and try and raise some nice vegetables I brought some slips of house plants with me and they have grown nicely. I like it in the woods first rate. I, too, like one of the cousins, can go huckleberrying and what splendid times we did have, and how good the dinner tasted in the open air. We have had plenty of huckleberries, raspberries, and blackberries, but we do not have any peaches or apples. The leaves are now beginning to turn their colors, and what a beautiful picture we will have with the dark green of the hemlock, and the red, yellow and brown of the beach, birch and maple. MINNIE D. JUDSON.

Indian River, Mich.

DEAR UNCLE MARK:—I see lots of little boys and girls writing to you, so I thought I would write. I am a little girl nine years old, I go to school and read in the Third Reader. I have three brothers, Lenly, Wilbert and a little baby brother. I like him very much. He never cries. I wish you to remember me when you send out seeds. Good-bye. BIRDIE MCDOWELL.

Norwich, Ontario.

DEAR UNCLE MARK:—I have long wanted to join your club. Is there room for me? I go to school in the city of Dowagiac. Pa raised 30 bushels of sweet potatoes and 250 bushels of Irish potatoes. I have quite a number of house plants. We have 17 stands of honey bees. Pa has taken the RURAL for the last 20 years. I have four pets, a cat, a dog, a cow and a chicken. The cat is four years old. I have been offered $25 for it, but that is no temptation. he weighs 12½ pounds.

Yours truly, MINNIE CONNINE.

Cass Co., Mich.

DEAR UNCLE MARK:—My papa takes the RURAL and we all like it very much. Mamma likes to read it and all the rest of us, especially the letters of the RURAL cousins. I am 13 years of age, and I love to go to school, I study arithmetic, and geography. We thank you for the seeds you sent us. We have a magnolia which we raised, and would like to know if we are to keep it in the house all winter. Your niece, E. L. BERLIN.

Monroe, Clason Co., Pa.

[The Magnolia will live out of doors through the winter in your climate. U. M.]

DEAR UNCLE MARK:—I want to join the RURAL Club, and I want you to send me seeds in your next seed distribution, and I will plant them. I love gardening very much. May I get up a club for the RURAL and try for any one of the premiums you offer? My love to all the cousins. Your nephew, HENRY J. L.

Jefferson Co, N. Y.

[You can of course, try for premiums, Uncle Mark will be pleased to add all the new readers to the club. UNCLE MARK.]

DEAR UNCLE MARK:—We are two little sisters, ten and six years old, please may we join your Horticultural Club? We live in a big farm about five miles from the city; we have a little brother and his name is Gillie, he is four months old, when may he join? If Uncle Mark accepts us as cousins we will in our next write about our plants and pets. MAY and NELLIE HATFIELD.

Luddington, Mich.

[Uncle Mark adds all three of the names to his Club list.]

DEAR UNCLE MARK:—I am a little girl ten years old and I would like to join your club. I have flowers that are very nice. Ma got flower seeds from the RURAL, but it was so dry they did not come up well but the Cuthbert is doing well. Ma takes the RURAL and we like it very much. Please remember me when you send seeds. From your niece ADA HAMILTON.

Hansell, Franklin Co., Iowa.

DEAR UNCLE MARK:—We are much interested in the letters from the Cousins and wish to join the Club. Maud, ten years old, Guy, eight years, Floss, six and Irene four. We are all great lovers of flowers, plants and gardening. We had a nice yard during the Summer, but the frost has made sad havoc with them now. J. F. B.

Susquehanna Co., Pa.

[Nora S., Elkhart, Ind., will find her name among the club members when seeds are again sent out. Uncle Mark will be happy to add the names of every one of the young folks in the land.]

Sabbath Reading.

QUESTIONINGS.

WHY do the children leave us, O our Father—
The little children cradled on our breast?
Why do our doves fly upward in the morning
While other birdlings sleep within the nest?
Can it be true that music up in heaven
Is sweeter when their voices join the hymn?
Is richer light to realms of glory given
For that which fading left our homes so dim?

And can the angels who, all day are giving
Care to the lambs within the Shepherd's fold,
Need, as a mother needs, amid her grieving,
The little ones at night to clasp and hold?
When shall we see again the precious faces
That gave our homes such sunshine when they smiled?
Oh, what shall fill the heart's sad vacant places,
Or hush the tones that plead, "Give back the child!"

Why must we listen vainly for the patter
Of little feet at morning on the stair?
And miss the merry sound of childish laughter,
Or gentler tones saying the evening prayer?
Why vainly long for kisses falling purely
From lips that said their good-night at our knees?
Oh, He that made the mother-heart hath surely
No chiding in his own for thoughts like these,

E'en this how can we know—His hand hath smitten
In wrath or mercy? Only he can tell.
Perhaps in some sweet day there may be written
Upon our hearts this record, "It is well."
Perhaps the broken hearts that thrill and quiver
Through all the night under the hand of pain
May in the morning of a glad forever,
Wake 'neath God's touch to melody again.

BE COURTEOUS.

I WILL give you a text, a little short text of two words only, which you will have no difficulty in remembering: these two words are, "Be courteous."

You all understand what it is to be courteous; it is to be polite, and to think of other's needs. It is a part of good manners to be courteous to one another, and when we see any one rude and forgetful in his behavior, we say of him that he has never learned manners But courtesy is even more than this; it is a part not only of good manners, but also of religion. The Bible teaches us a great deal about courtesy in deed and word It tells us to be gentle in speech and manner, to be patient with one another, not to answer again; not to think only of our own pleasures, nor to choose out the best places for ourselves. If in all such little things as these we think not of ourselves, but of other people, then we shall be truly courteous; for courtesy, is, in fact, "unselfishness in trifles."

One day at a crowded crossing, an old man was standing hesitating, afraid to venture over. Just at that moment a young girl passed by, with her Prayer-book under her arm, on her way to church. She saw the old man's difficulty, and coming up to him, she took him by the hand and guided him carefully across the dangerous road. Then, with a pleasant smile, she turned back and went on her way again. It was but a little thing, yet it showed the spirit of true courtesy, ever on the watch to help others.

It is impossible to say how much good may not be done by one courteous deed Not long ago I read of a heathen soldier in India who was serving under an English captain. This captain was a very good man, who by his unfailing kindness to his men made himself so beloved by them that any one of them would have been ready to die for "the father of their regiment," as they used to call him.

The soldier longed to know what prompted this spirit but would not venture to ask. He said to himself, "Surely this man must have the true religion." He was taken dangerously ill, and was removed to the hospital. As he lay suffering and wretched, the door opened and in walked the captain, come on purpose to visit his sick soldier. He sat by the bedside and talked to him, and told him about our Savior. The man hardly understood what was said to him, for his mind was full of his captain's kindness in thus remembering him and coming to visit him. As soon as he was well again he went to the captain's house and asked him that question which he had delayed so long—"What is your religion?" "I am a Christian," he replied. The soldier did not know much about Christianity, but he thought that the religion which made a man so good and brave and unselfish must be the true religion. He wished, he said, to become a Christian himself; and so, after he had been carefully trained and taught, he was baptized. To the end of his life he showed himself a true Christian, and died at last happy in the thought of his Savior's love. Thus the courtesy and unselfishness of one man led a heathen soldier to believe, and brought him out of darkness into light.

Be courteous in word as well as deed. Whenever you are spoken to or asked a question, take the pains to give a courteous answer. It is as easy to answer politely as to answer rudely, and how differently every one feels toward any one—whether he be a child or a grown-up person—who takes the trouble to attend to what is said and to answer pleasantly, and one who answers carelessly or rudely! No one knows, until they try, how much happiness they have it in their power to give to others, just by speaking pleasantly and courteously, for, that is a most true old saying which tells us that "good words are worth so much, and cost little." F. E. A.

THE gentle mind is like a smooth stream which reflects every object in its just proportion and in its fairest colors. The violent spirit, like troubled waters, renders back the images of things distorted and broken, and communicates to them all that motion which arises solely from its own agitation.

PERSONAL ITEMS.

Gambetta has a premature look of old age.

Mr. Elihu B. Washburne, formerly United States Minister to France, arrived from Bremen on the Mosel on Friday, Oct. 29.

Lewis Irwin displeased his parents, at Gallipolis, Ohio, and while his mother pounded him with a club, his father shot him with a pistol.

The Prince and Princess of Wales and the Crown Prince and Princess of Germany will attend the marriage ceremony of Prince Rudolph of Austria, heir-apparent to the throne, early in February.

President Washburn, of Robert College, Constantinople, who is at present in Boston, predicts a revival of the ultra-Turkish spirit in the mind of the Sultan, in which event a religious crusade against the enemies of Islam is likely to be declared.

Thomas L. Butler died at 91, in Louisville, a few days ago. His father and four uncles distinguished themselves in the Revolution. Washington once gave this toast at a dinner: "The Butlers and their five sons," and Lafayette wrote in a letter: "When I wanted a thing well done I ordered a Butler to do it." Members of the family moved to Kentucky, and became of social consequence there.

"I Have Come to Life, and Am So Thankful."

"I am very happy indeed," writes a lady, "and feel as though I lived in a different world from what I did last winter. *I have come to life*, and am so thankful!" She had used Compound Oxygen for nearly a year. "I was a terrible sufferer from nervous prostration, gastric trouble, and nervous irritation of the stomach; life was hard to be endured. * * My friends wonder to see me do so much; many never thought to see me alive again, and can not sufficiently express their surprise. I have waited to be quite sure." All information about the Compound Oxygen Treatment is contained in our Treatise, which is *sent free*. DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

New Publications.

MUSIC BOOKS FOR SCHOOLS.

The Welcome Chorus. ($1, or $9 per dozen.) By W. S. TILDEN.

This is a new and superior HIGH SCHOOL SONG BOOK with advanced elements, and a great variety of music, secular and sacred, to be sung in one, two or four parts. Mr. Tilden's previous works have been highly approved.

Song Bells. (50 cts.) By L. O. EMERSON.

No more attractive SCHOOL SONG BOOK has for a long time appeared. It is not graded, and will do for any class. Great variety of songs, subjects selected with great skill, and music is of the best.

Introduce our new SABBATH SCHOOL SONG BOOK, **WHITEROBES**, (30 cts.) at once to your Sunday School. No better book exists!

Books for Music Teachers for the Fall Campaign. All are good and practical books. Do not fail to examine them.

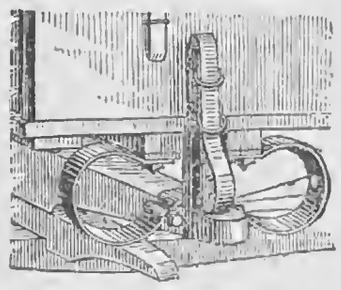
SOMETHING NEW!
PULLIAM'S PATENT
BOLSTERS SPRINGS for FARM WAGONS.



This valuable device is suited to wagons of any size—made of the best steel and warranted—are attached by four bolts through the bed—can be put on by any person. They remain on the wagon for all uses and work equally well whether with empty or loaded wagon. There is no use for a spring seat—they make a comfortable spring wagon out of a farm wagon—and save largely in wear and tear. We want Agents everywhere. Send for description and prices, and mention this paper.

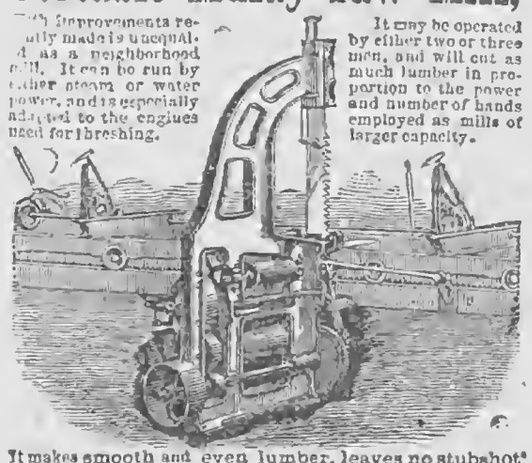
Implements and Machinery.

Portable Mulay Saw Mill,

All improvements really made is unequaled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.



It makes smooth and even lumber, leaves no stubs hot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc., to **CHANDLER & TAYLOR, Indianapolis, Ind.**

BEST WASHER AND WRINGER
In the World. Guaranteed to do perfect work or money refunded. Warranted for 5 years. Price of washer, $8. Sample to agents, $3.50. Price of Wringer, $7.50. Sample, $4.25. Circulars free.

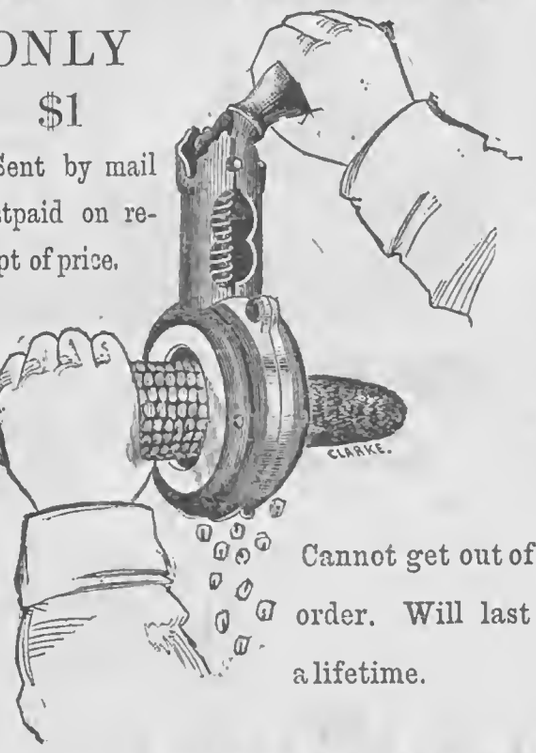
WINTER DAIRYING A SUCCESS
By using **THE FERGUSON BUREAU CREAMERY.**

No special room or extra fire needed. Gilt-Edged Butter made at all times, winter or summer. It surpasses all others in quantity and quality of butter made. It excludes flies, dust and odors; is constantly at the correct temperature 53° to 60°; has room for the cream and butter, and saves three-fourths the labor. **THE FERGUSON CONCUSSION CHURN** is the best. It combines scientific principles with the best labor saving devices. No floats or paddles. Brings the butter in granular form, and secures the largest yield. Send for illustrated circular to **The FERGUSON MF'G CO., Burlington, Vt.** Ag'ts Wanted.

NEW PREMIUM CORN SHELLER.

ONLY $1

Sent by mail postpaid on receipt of price.



Cannot get out of order. Will last a lifetime.

This is the only Cheap Practical Hand Corn Sheller in the market and is in every way the

BEST HAND CORN SHELLER EVER INVENTED.

Shells 25 to 30 bushels a day **very easily.** Is especially recommended to farmers who shell large quantities of corn for seed. It has been customary to remove the imperfect kernels from both ends of the ear with the hand, and use the full, perfect kernels of the center for seed. This is a long, tedious process, but with this sheller it can be done in one-tenth the time. To poultrymen, to seedsmen and to anybody who shells corn, we recommend it. Can be carried in the pocket and samples of corn taken from any part of the field by shelling only part of an ear.

Our PREMIUM CORN SHELLER is destined to become the **Leading Hand Corn Sheller** of the day, and you will find it profitable and to your advantage to secure the sale of it. When it is once introduced no other small sheller will be wanted in your locality. This Sheller opens a new field for reliable agents. A very profitable business can be done upon a small capital.

Believing this to be the Best Low Priced Corn Sheller ever invented we have secured the General Agency for the United States, and we want

CANVASSING AND LOCAL AGENTS IN EVERY COUNTY.

Sample sheller and price list sent prepaid to any address upon receipt of $1.

Humorous.

"Do we eat too much," asked the "Detroit Free Press," and out of five dozen boarding-house keepers, sixty answered in the affirmative.

SOME young men went out the other night to "have a little time." They had just as little time as they wanted to get out of a neighboring orchard, and a vicious dog had all the fun.

"CÆSAR," said a good-natured gentleman to his colored man, "I did not know till to-day that you had been whipped last week." "Didn't you, massa?" replied Cæsar; "I knowed it at the time."

A CERTAIN doctor of divinity said every blade of grass was a sermon. The next day he was amusing himself by clipping his lawn, when a parishioner said, "That's right, doctor, cut your sermons short."

TEACHER—"Suppose that you have two sticks of candy, and your big brother gives you two more; how many have you got then?" Little Boy (shaking his head)—"You don't know him. He aint that kind of a boy."

AN elderly resident of Newtown was approached by an agent for a cyclopædia. "I guess I won't get one," said the elderly resident, and frankly added, "I know I never could learn to ride one of the pesky things."

"I UNDERSTAND that Dr. Jones is abroad," said Brown; "is he traveling for his health?" "I suspect," said Fogg, "that he is traveling for his patient's health. I know one of them who has improved on his traveling added Fogg, with energy.—Boston Transcript.

A MEMPHIS man wanted to kill a mosquito on the back of a friend's neck, and without stopping to mention his design, hit the insect a belt, and when his friend got up and brushed the sand out of his mouth and eyes, four men had to hold him while the matter was explained.

ONE of the New York wholesale dry goods houses has a new clerk whose father from the country went in to see him the other day and was surprised to learn that all the salesmen had nicknames. He asked the floor walker why his son was called "Jury." "Oh," was the reply, "he is always sitting on cases."

A YOUNG man with an umbrella over-took an unprotected lady acquaintance in a rainstorm, and extending his umbrella over her requested the pleasure of acting as her rainbow. "Oh!" exclaimed the young lady, taking his arm, "you wish me to be your raindear." Two souls with but a single umbrella, two forms that stepped as one.

NOT long ago an Irishman applied to an overseer in a Tyne shipyard to be put on a job. He was informed that his request could not be complied with; but as Pat continued to gaze at an anchor which was lying in the vicinity the foreman repeated his reply that there was no work for him and advised him to go away. "Divil a bit will I stir, sorr, till I see the man that's going to use that pick!"

THE London Church Times tells the story of some Sunday-school children taken for a picnic to the seaside. One of the teachers asked her scholars how they liked the sea. "Very much, miss," replied a child; "but where are the tinnamies?" "The tinnamies, my child! What do you mean?" "Why, you know," the child replied again, "the tinnamies that go with the sea. You know the commandment says, 'the sea and all that tinnamies,'" This was the way the child had been repeating "the sea and all that in them is."

Cause and Effect.

The stomach is accountable for more headaches, nervousness and general physical derangement than any other organ. These effects, of which its weakness and derangement are the cause, are of course only to be permanently remedied by a medicine which restores its regularity. The primal action of Hostetter's Stomach Bitters is upon the stomach, the equable action of which it renews. As a consequence, the associate organs, the bowels and liver, regain activity and vigor, and the brain and nervous system generally experience quietude, which they never can while the gastric and bilious functions are disturbed. Infinitely greater bodily comfort is derivable from a systematic course of this genial medicine, than is to be found in a recourse to heady stimulants, and local "tonics" and "appetizers," so-called, the alcoholic principal of which, usually fiery, is unmedicated by the admixture of botanic remedial constituents.

THE NAOMI GRAPE—From Life.—Fig. 360.

The Vineyard.

PORTRAITS OF NEW AND PROMISING GRAPES CONTINUED.

NAOMI.

A COUPLE OF RICKETTS'S SEEDLING GRAPES.

For the past four years the Naomi Grape and indeed all the rest of Mr. Ricketts's seedlings have been closely watched by me.

The Naomi,

is a hybrid raised by Mr. Ricketts of Newburgh, N. Y., parentage Clinton fertilized by Muscat, but what one I am unable to say. Its delicious Muscat flavor, however, proves clearly that it is closely connected with this class. Although it is a hybrid, I consider it very hardy, but I would not be understood to say that it is entirely so. The parent vine has borne a fair crop of elegant fruit each year since my first acquaintance with it, though it is partially shaded by a pear tree standing within a few feet of it, and has had very poor culture, its owner, I am sorry to say—nevertheless it is true—being a heedless cultivator, as Mr. Husmann truly remarked in one of his articles published last Fall. It has sometimes been covered with leaves through the Winter, while at other times I have known it to remain on the trellis till Spring without protection, uninjured. The vine is a fine, vigorous grower. I have a vine raised from a single bud cutting this season, that has grown twelve feet, and its diameter four inches above the ground is half an inch. Foliage large, quite thick and coarse; bunch large, shouldered sometimes heavily; berry, medium, somewhat oblong; color green, sometimes slightly shaded with red when fully exposed to the sun, and covered with a delicate white bloom; flesh, breaking juicy, rich, quite highly flavored with Muscat; ripens with Concord or perhaps a trifle later; quality best, and it is an excellent keeper, I have eaten it in good condition the last of February plump and sound. With good vineyard culture I am confident the Naomi can be profitably grown for market; indeed, I am so favorably impressed with it that I intend to graft it largely in my vineyard next Spring.

The Lady Washington.

is also one of Mr. Ricketts's seedlings—parentage Concord fertilized with Allen's Hybrid. It is one of the most hardy and vigorous growers with which I am acquainted, fully equaling the Concord in this respect. Its foliage is large, thick and downy; its bunches are large, often very large, uniformly compact, and generally shouldered; color, light-yellowish amber, slightly tinged with delicate pink when fully exposed to the sun. It will grow and succeed well on ordinary soil that will produce good Concords. Of this fact I have abundant proof in my own vineyard, and I am inclined to believe that too strong a soil is detrimental to it as it encourages too rampant a growth at the expense of fruit. Any tyro can grow the Lady Washington. In conclusion, I would say I have no doubt that many of Mr. Ricketts's seedlings will succeed far better with those who are good cultivators than they do with him.

J. G. Burrow.

Naomi.

Of the Naomi grape Mr. Charles Downing writes us:—

"One of James H. Ricketts's seedlings; vine, very vigorous, rather long-jointed; leaves, large, deeply lobed, coarsely serrated; bunch, large, long-shouldered, often double-shouldered; berry, medium, roundish, inclining to oval, pale greenish white, often with a tinge of light red where exposed to the sun, and a thin grayish-white bloom; flesh, juicy, melting, rather crisp, sweet, sprightly and very good, with a trace of Muscat flavor. The berries adhere well to the pedunele. It ripens with the Concord, and is a good table grape."

Pomological.

POMOLOGICAL IMPROVEMENT IN MICHIGAN—PEACHES.

T. T. LYON.

Peach culture in Michigan has, up to the present time, been confined mainly to the popular varieties of the East. It is only within the last two or three years that anything like improvement has been accomplished, or even (so far as the public are aware) attempted, in the way of the local origination of varieties of peaches with reference to local wants. More recently, however, a few of our more progressive cultivators have set themselves at the work of elaborating something of this kind, to fill seasons not yet satisfactorily supplied, and to supplement varieties now in use, but lacking some qualities more or less essential to the purposes for which they are grown.

Notwithstanding the readiness with which the process of artificial hybridization may be performed upon the peach, I am not aware that any of our experimenters have sought improvement through this means. On the other hand, however, one of our fruit growers has planted what may be designated as an experimental plat, by alternating in rows three varieties of peaches, with the expectation that many of the blooms would become crossed through the influence of winds or the transferring of pollen by insects. The seeds from the fruits grown under the circumstances were planted, and the resultant trees have, many of them, fruited for the past two or three years.

In this case the Hill's Chili (which was one of the three parent varieties) seems to have vindicated its fixity of character, since 40 or more of the resultant seedlings are unchanged and unmistakable Hill's Chilis. The Early Crawford—another of the parents—seems to have almost wholly failed to transmit its peculiarities; while the third variety—Hale's Early—while yielding much to the vigorous constitution of the Chili, shows the force of its one marked peculiarity—earliness; in the production of several sorts which, while losing the white flesh and with it the tendency to cling to the pit, range from the season of Hale's Early to nearly that of Early Crawford, thus supplying what at least our Western markets seem to demand—a set of good yellow market peaches from and after the season of Hale's Early.

It is yet too soon to speak assuredly as to the ultimate value of these new candidates for the favor of planters, although I am inclined to regard some of them as very promising. I am not aware that they are yet propagated and offered for sale.

Yet another well-known peach grower of our State has been for several years experimenting in a somewhat different direction. His experiments, so far as peaches are concerned, have been mainly confined to the two Crawfords—Early and Late. His process is to plant the pits of these varieties, in nursery, and when the seedlings have made a year's growth, to select such as most clearly manifest the peculiarities of the parent; his purpose being to push his improvements in the line of the parents. I learn that by this process, which has now been in progress several years, he has been able to secure an orchard of several hundred trees, seedlings of Early Crawford, with little if any variation from the type of the parent.

In one instance, at least, however, he has succeeded in obtaining a new variety with reniform glands, with fruit in color and quality like Early Crawford, but which, after four years' fruiting, proves to be ten days earlier and about one-fourth larger.

His experiments with the Late Crawford have not been so long in progress, and although conducted in a similar manner seem to have shown a greater aptitude for variation on the part of that variety, since, in his selections from a season's planting, he has now in bearing a set of four seedlings in size, form and general appearance much like the parent, but some of them more beautiful, the four covering the season from before Late Crawford to early October, while in quality all are as good as the parent, and one or more of them are claimed to be decidedly better.

Besides these, several apparently promising seedlings have come to my knowledge during the past season, one being a very early peach apparently a seedling of Hale's Early, and of season and quality much like Amsden and Alexander.

Field Crops.

TWO CAREFUL EXAMINATIONS AND REPORTS UPON BLOUNT AND CHESTER CORN.

Report on a field of corn at Hewlett's, Long Island, belonging to the Rural New-Yorker, made Oct. 12th, 1880. Size of plot, 310 ft. by 122.4, or .87 of an acre of corn—"Blount's Dent"—sown by machine in rows four feet three inches apart, and each single kernel intended to be 15 inches from its neighbors. Flat culture, with, as we understand, 300 pounds of Mapes's special corn fertilizer harrowed in broadcast before planting, 100 pounds of the same when the corn was six inches high, and 100 pounds of potato special when about 18 inches high. From a judicious selection of stooks and careful measurement and weighing, we find the total yield was 227 bushel baskets of corn on the cob, or 261 bushels upon an acre,

We also shelled and weighed a quantity and ascertained the gross weight of three and seven-eights baskets to be 136 pounds, or 35.1 to one bushel, and further that 35 pounds of corn in the ear gave 28.95 pounds of grains and 6.05 of cob, and measured 17.1 quarts.

This calculation showed that the equivalent of 261 bushels of corn on the cob was 139.4 bushels of grains, and about three bushels or a little more which Mr. Carman had selected from the most prolific stalks, and had already placed in the barn, or a grand total of about 142 bushels of shelled corn per acre.

Robert J. Dodge, C. E., Pres't Farmers' Club, American Institute.
W. N. Habbershaw, F. C. S.,
Chemist, N. Y. State, Ag'l Society.
L. C. Benedict, Ed. N. Y. World.

We freely accept the above report as the actual yield per acre, and our best thanks are due to those who for five hours worked diligently for the data upon which it is based. Nevertheless we beg to call the committee's attention to one circumstance which, we think, was not considered in the final estimate. In the course of the husking, Mr. Dodge ordered what *seemed* to be about the smallest stook in the field husked as if to ascertain what would be the *minimum* yield. The other stooks husked were selected because they seemed to be of *average* size. The yield of this small stook was counted as that of an average stook the same as the others, which must have materially reduced the estimated number of bushels per acre. This circumstance, we think, was overlooked by the committee, as, indeed, it was by us until we received the above report, which, being less than we anticipated, set us to figuring out how it could have been arrived at.—Eds.]

Mr. Bruggerhof (of the firm of James M. Thorburn & Co.) was one of those who a few days previously to the above investigation—estimated the yield of the Chester Co. Mammoth. His estimate was based upon the yield of stooks in the west portion of the field, and as we have since ascertained that part of the field yields most heavily. The following is his certificate:

This is to certify that three stooks of the Chester Co. Mammoth, which I selected as of average size, were husked and measured in my presence, and that at the same rate per acre the yield would be at least 300 bushels of perfect ears. F. W. Bruggerhof.

THE SILVER CHAFF WHEAT.

During the Fall of 1877 we received from the Department of Agriculture at Washington one-half bushel of Silver Chaff wheat, with the following description:

"This wheat comes from York County, Province of Ontario, Canada, where it has been successfully grown for two years. It is a distinct variety of smooth, white, winter wheat, withstands the severest frost, and is not liable to disease or rust. Its weight is 62 pounds to the measured bushel."

During the three seasons over which we have now grown this wheat it has given proof of being a most valuable variety, having yielded larger crops than either Fultz or Clawson, having a stiffer straw and harder berry than the Clawson, being as free from all diseases as that variety, and showing no sign of smut, which has proved very injurious to the Fultz in some localities. At the harvest of 1878 the Silver Chaff was several days later than the Clawson in ripening, but it is apparently becoming earlier, having ripened on the same day as the Clawson this year.

I have before me a number of letters written by farmers living in various sections of Ohio and several of the neighboring States, who have grown the Silver Chaff wheat during the past season. The substance of these letters is, that in clay or sandy lands it has averaged somewhat larger crops than the varieties with which it was compared, which were, in nearly every case, either Fultz or Clawson; but that on black lands it has suffered a little more than other varieties from the peculiarities of this season which have caused many acres of wheat to fill imperfectly, thus producing shrunken grain. This climatic trouble has apparently been greater south of the 40th parallel, causing, in many cases, and especially in the Southern States, an almost complete destruction of the crop, without regard to variety. I infer from my correspondence, that through the Northern States the wheat growing on black soils has suffered more than that on sands or clays, and that while, on such soils, the Silver Chaff has suffered a little more, the Velvet Chaff has suffered considerably less than Fultz or Clawson.

The quality of the straw of the Silver Chaff has generally been reported as satisfactory, one correspondent writing "I do not believe any land can be too rich for it," which corroborates my own experience, but in some cases it has lodged from the pressure of high feeding, or broken from the effect of rust or of the climatic causes mentioned above. C. E. Thorne.
Ohio State Ag. Col.

SELECTING SEED CORN.

This comes to me in the Rural of October 9. "Prof. Blount: You advise in selecting seed corn to select only the topmost ear when there are more ears than one. Suppose the topmost ear is not so large, the kernels not so perfect as the others—would you still select it?"

By no means. Reject it as well as every other ear on the same stalk. Reject it as you would a defective animal. Stockmen never select imperfect and diseased specimens to breed from, nor are they satisfied to take fair specimens from a poor or defective parentage. No more should the farmer select his seed from poor and defective stalks or ears. If the stalk be a healthy one and free from injury by insects or weather, the topmost ear is always the largest, best formed and has the best filled grain, provided the parents from which it came were perfect. Every variety of standard corn produces its best ear nearest the tassel for reasons that are quite evident. Being nearest, it receives the pollen first and in greater quantity than those below it; another reason is that it is the natural distance from the soil, etc., etc. A careful examination of the stalks in every stage of their growth always shows that the lowest ear has the longest shank, the next has a shorter one, and so on to the topmost one, which sets close upon the stalk. It shows also that the lowest ear is the smallest and the top ear the largest, as above stated. A. E. Blount.

Farm Economy.

WHICH FORM OF NITROGEN IS MOST READILY ASSIMILATED BY PLANTS? No. I.

PROFESSOR F. H. STORER.

The question has been a good deal debated abroad whether it is better to use sulphate of ammonia or nitrate of soda, when an active nitrogenous fertilizer is needed for field crops, and there is a great deal to be said on both sides of this purely practical question. That each of these chemical compounds can give excellent results, under fit conditions, has been shown by practical experience at the farm in numberless instances. The power of the soil to fix and hold the ammonia of the ammonium salt is of advantage in some cases, though perhaps disadvantageous in others; while, on the other hand, the easy diffusibility of the nitrate in the soil may be beneficial to the crop or wasteful of the manure, according to circumstances.

The subject is all the more difficult because there is good reason to believe that plants are not by any means indifferent as to the kinds of nitrogen which are presented to them. One species of plant may find the nitrates excellent food and thrive upon them continuously, while another kind may be grateful for ammonia as well as for the nitrates. More than this, one and the same plant may, at different periods of its growth, make good or bad use of one or the other kind of nitrogenous food. In view of these facts, it becomes a matter of great interest to find out, if possible, which crops or classes of crops are especially apt to feed upon ammonia or upon nitrates; or, indeed, upon the other compounds of nitrogen such as those found in dung, urine, and guano, which are known to be true food for plants. The value of this information would by no means be limited to the narrow question whether an ammonium salt or nitrate of soda should be bought in a given case; for it would apply to the whole subject of manuring, either with dung or with chemicals. In the light of desired information, the farmer would naturally strive to give to those crops which can feed upon ammonia such manure as contains this substance ready-formed or which produce it when they putrefy. Possibly, it might even be best in some cases to try to hinder nitrification in the field and to maintain the manure at the ammoniacal stage of decay for a suitable length of time; while in the case of crops which crave saltpeter it should be looked to that the land is marled, or provided in some way with an abundance of carbonate of lime, and in general the arrangement should be such that the process of nitrification may go on in the soil of the field more rapidly than it would naturally. To the crops which prefer to get their nitrogenous food in the form of urea or uric acid we would naturally give fresh manure, guano or urine—as has been done often enough in the history of agriculture by folding sheep.

A good deal of study has been given by chemists in past years to the question, which is the best nitrogenous food. The earlier trials were made in the hope of determining precisely the comparative value of nitrates and ammonium salts considered as plant-food. It was soon perceived that the nitrogen in the nitrates is much more generally directly available than that in the ammonium compounds. It was seen that for many kinds of plants the nitrates can supply nitrogenous food, and to all appearance they can supply it in the best possible way. But as regards ammonia, it was by no means so clear that it could ever serve directly

as plant-food. Knop and other experimenters were unable to grow seed-bearing plants, by way of water-culture, when the nitrogenous food was given in the form of ammonium salts alone, though with nitrates, and with mixtures of nitrates and ammonium salts, they succeeded well enough. In many cases it appeared that ammonium salts were not at all fitted to directly supply the plants with nitrogenous food; but it was argued that the fact was probably of no great importance as regards field crops, since ammonia is known to change to nitrates in the soil. More recently several attempts have been made to determine, in respect to particular kinds of plants, whether ammonia salts or nitrates are preferred as food at one or another stage of growth, and this is the point which is now of special interest.

Some valuable suggestions have been gained already, and no doubt the problem will be solved in process of time, in spite of certain difficulties which have beset it hitherto. Not the least among these difficulties was the liability of the ammonium salts to change to nitrates in the actual course of the experiment—a tendency which can probably be counteracted henceforth; for it has recently been discovered that the change of ammonia to nitrates is not a matter of mere chemical oxidation as had been supposed, but is caused by certain minute organisms whose life, or whose activity at least, can readily be destroyed by the vapor of chloroform and various other chemicals. Among these vapors there will doubtless be found some which while keeping the ammoniacal fertilizer intact during the whole course of the experiment, will have no influence whatsoever upon the growth of the plant. As an instance of this kind of perturbation, an experiment of Bayer may be mentioned. He sought to grow oats, by way of water-culture, in a solution of fertilizers where the nitrogen was in the form of bicarbonate of ammonia. The plants started in a miserable, crippled way, and most of them died after a short time. Some of them grew, however, in a feeble way until the time of blossoming, and even bore a few seeds. But when the experiment was just about to be concluded the plants suddenly began to grow freely, and on examination it appeared that almost the whole of the ammonia salt had been changed to a nitrate. On repeated trial he was unable to grow healthy oat plants with ammonium salts, though the oats grew readily under the same conditions when supplied with nitrates. In field experiments made recently by Professor Heiden, to test this point, it appeared that crops of oats did better with nitrate of soda than with sulphate of ammonia.

Some of the most noteworthy experiments upon this question are those of Julius Lehmann. He grew a large number of plants of buckwheat and of Indian corn in solutions which were all of similar composition in respect to the ash ingredients, but which differed from one another in that some of the solutions contained nitrate of iron while others contained sulphate of ammonia. The buckwheat plants grew very well in the solutions that contained nitrates, as well indeed as they would have grown in a garden, but they grew very badly in the solutions that contained the ammonium salt. This result does but confirm the observations of previous observers, who found that buckwheat succeeds when fed with nitrates and that it does not need ammonia.

Indian corn, on the other hand, behaved in a very different way from buckwheat. The plants were placed in the jars on the 19th of June, just after they had germinated, and in a week's time all the plants fed with the nitrate seemed to be in a starving condition, while those fed with ammonia grew freely from the first and exhibited most conclusive evidence that they were getting the right kind of food. But at the end of six weeks the appearance of all the corn-plants suddenly changed, both those which were getting the nitrate and those fed with the ammonium salt. The nitrate-plants became green all at once, although no change had occurred in respect to the outward conditions under which they were growing, and from that time forth the nitrate-plants grew well and rapidly. But with the ammonia-plants the precise reverse of this occurred, and at the very same time. The leaves of these plants lost their healthy color and the plants took on a sickly appearance; while the nitrate plants grew continuously and developed normally until the 15th of September, the ammonium-plants ceased to increase in size, they remained stationary in a miserable condition.

Moreover, on changing some of the sickly nitrate-plants, during the first period, into jars that contained the ammoniacal food, they revived immediately and took on a lively green color in two days' time; and so, conversely, on putting some of the healthy ammonia-plants into a solution that contained nitrate of soda they became at once pale and sickly. So, too, during the second period, when, as it appeared, the corn-plants had need of nitrogen in the form of a nitrate, such a shifting of the plants from one kind of jar to another immediately exhibited the advantage of this kind of food. Lehmann changed some of his plants repeatedly and found that he had it completely in his power to make the plants pale and sickly or green and healthy, as he might will.—To be continued.

The Poultry Yard.

MANAGING AN INCUBATOR.

L. S. HARDIN.

I HAVE no desire to take issue with the makers of incubators, but I must, nevertheless, as a faithful chronicler of facts, warn my readers against the ease and luxury with which an incubator can be managed—according to several pamphlets before me. This is evidently a mistake, that is, so far as it relates to the citizen of average capacity. Some people have a knack of making things go without an effort, but the chances are that you are not one of that class. I was told to-day of a neighbor who used up 250 eggs before he got started. That reconciled me to my mishaps, for it has cost me 45 eggs to get four chicks, and they are but five days old, though they are very fine specimens. My next batch are now hatching out, and I expect far better luck with them. But more of this anon.

Suppose the incubator has arrived. If it is not a self-regulator, all you have got to do is to buy a lamp if none comes with the machine, light it and put in the eggs, and then sit down and watch it until you get the lamp to burn regularly and at the proper temperature. Remember the whole machine must get thoroughly warmed, say four or five hours after the lamp is first lit, before you can depend upon a steady heat in the oven. It is a better plan not to put in the eggs until the machine has been run a day or two. If the incubator has a thermostatic bar for a regulator, it will need but little adjusting before it is ready to start. The room selected to work in should be as free from superficial atmospheric changes as possible, and the warmer the better for Winter work, as the warmth saves oil and the less changes of atmosphere the less danger of the machine failing to protect the eggs. The above requirements are best found in a dry, warm cellar, but a more convenient room upstairs will do.

If the incubator has a battery to work it, you should know something of the principles involved. Such knowledge will save you a world of trouble and explain errors and avoid mishaps that you could not otherwise discover or avoid. The printed instructions that came with my machine were of no value to me at all outside of my previous knowledge of the principles governing a battery and the hints I fortunately got from the last owner of my machine. The only advice I can give is—should the battery stop working, don't get discouraged, but tinker with it and change things around until it starts again, when you will wonder that you had not thought of "that" before. Build a good strong bench or table against the wall to handle the eggs on. If you do not buy one with the machine, then make an egg-tester. You can do this easily enough by taking an old pasteboard hat-box and cutting a hole in the end, the size of an egg, and pasting a piece of black velvet or silk around this hole on the outside. Place a kerosene lamp in the box, cut a hole in the cover to let the lamp chimney pass through, and put it on. Air-holes must first be made in the sides of the box near the bottom, or the lamp will not burn when the cover is on the box. The incubator should rest upon a strong, firm stand, so that it will receive as little jarring as possible. At first I bought the most expensive kerosene oil, but afterwards found this needless, as the cheaper quality, 112° proof, burned just as long to a given quantity. It then cost 12 cents a gallon. You should have two oil cans holding two or more gallons each, so as to have one on hand full all the time, as you sometimes cannot get oil at the store just when wanted, as storekeepers often refuse to draw it at night or on Sundays. If you have a good place to keep a barrel, it is cheaper to buy in that way, as it makes a difference of about four cents a gallon, though it is well not to go so deep into the oil trade until you get better established in business, as the first barrel and faucet will cost something like two dollars. The barrel will afterwards be exchanged.

Either the types or my pen made a mistake in the estimate in my first article. I find that a 500-egg machine burns five instead of three gallons of oil a week, which, at 16 cents, present price, is 80 cents a week, or $2 40 for each hatching, which is much less than the cost of corn would be for hens enough to cover that number of eggs three weeks.

If sand is used in the pans, get the cleanest you can, and let it be thoroughly dried if to be used a second time. Sift all the gravel out of it, as it is apt to crack the eggs. Have a good pair of shears to trim the lamp with and a small tin bucket to heat water in. A small oil stove is invaluable in this business, as you often require warm water when it would be ruinous to wait to kindle a fire. This, by the way, is one of the most inexpensive and delightful conveniences about the house. A lady who has ever used an oil stove will not be without one.

If the supply of sand is at all convenient, the same panful should never be used more than once, as the old eggs taint the sand, which renders the air impure in the oven. Air heated to 104 degrees draws all the bad odors out of anything. Heat must be economized as much as possible, and to accomplish this all pipes leading into the oven should be wrapped with several thicknesses of felting, and all openings about the bottom of the furnace not absolutely needed to give a draft to the stove or lamp, should be closed, while extra sand or blankets may be put on top of the stove or oven and heater. By keeping everything clean and sweet-smelling in the oven much of the prescribed ventilation can be dispensed with, to the saving of much kerosene. The lamps should be turned just high enough to give the required heat, with a sufficient surplus to guarantee against a cold snap just before daylight, when we sleep soundest and are therefore most off our guard. Excessive heat not only wastes oil, but uses up the battery and causes more rapid and frequent changes of the atmosphere over the eggs.

In regard to the battery, the only supply necessary to keep on hand is a sufficient quantity of blue-stone (blue vitriol) to add a handful to the jar once in two weeks. This is quite inexpensive, costing only 25 cents a pound—about six handfuls.

In selecting eggs get the freshest possible, as they will stand rough usage and erratic temperatures best, and this is a virtue you will probably stand in need of with your first batch. It is hardly necessary to call attention to the economy of using the eggs of common fowls to begin with; but to illustrate the risks—while I have sat up with my machine night and day for something over a month, I have but 11 chicks out of 70 eggs, and those who preceded me say I have done remarkably well with my first hatches. I look for better luck as I proceed. Medium-sized eggs should be chosen. Get them in the oven as soon as possible after they are laid. Though it is more convenient in handling the chicks that they should come out in clutches, yet if long delays occur in getting the different lots of eggs, they had better be put in the oven in smaller numbers. Mark in figures the day of the month at one end of the egg. It is needless to put the month on, as that will be remembered. On one side of the egg make several marks with a soft pencil, so as to be able to tell when each egg is turned. If sand is used, it should be kept so damp that the top never dries, while it should not be so wet that it will leave the print of the sand on the egg. Water slightly discolors eggs and they should be watched, for too much dampness drowns the chicks. The eggs should be turned morning and night; my instructions say three times a day, but I am satisfied this would keep the eggs in the oven cold too long, as it requires several hours to get them back to the proper temperature after taking them out for the shortest time possible to turn them. At first, in turning them it is well to dip the fingers in water to make them stick to the egg and prevent breaking; but as you become accustomed to it, after a few accidents, you can become quite expert. It is best, of course, to have drawers that turn the eggs, which saves time, labor and oil. Some use a small garden sprinkler for wetting the eggs, but I prefer my hand dipped in water heated to about 100 degrees, and each egg should receive some of it. As the chicks in the eggs reach "maturity" the sprinkling should be more liberal, and the last day dip each one in the water. Once a day the eggs must be aired. Good judgment is your best guide here, the length of time to let them remain out depending upon the outside temperature, from 15 to 30 minutes being usually required. Let them feel a little cool, but not cold, to the hand when you lay it on them. Do the sprinkling just before returning the eggs to the oven. The longer within reason they remain out without getting too cold, the better.

Weed out the old Stock.

The great mass of fowls kept by farmers are used, so to speak, as scavengers; that is, they live simply by picking up what would otherwise be lost about the farm. Feeding them is rarely thought of, unless what is thrown out to them from the scraps in the kitchen in cold weather be called feeding. In Summer it would not be wise to feed much, if any; while in Winter it is the part of wisdom to feed, not only a little but liberally. When this is done some discretion must be used or all the pains and cost of the operation will be thrown away on a lot of "dry," old hens that have long since laid out their last eggs, or only retain enough to make an apology for sitting on other hens' eggs after laying a clutch of two or three at most. When a hen is born into the world she holds within her body the embryos of all the eggs she will ever lay, no matter how long she may live. The first twelve months after she begins laying she will yield almost one-fourth of her full complement of eggs, and by the end of the second year nearly three-fourths of all she will ever yield, while the remainder of her life is occupied in delivering the last quarter of her full yield. So it will be seen that the first and second years of her busy life are the most profitable ones to her owner. It is, therefore, economy to weed out the old hens with a severe discrimination. Keep nothing over three years old, and if the greatest economy is practiced and the largest profits demanded, as they should be, then nothing over two years old will remain on the farm. As the Fall months merge into Winter, chicken feed becomes more scarce and all of it should be reserved for the hens that do the work. Old, superannuated cocks should go into the pot along with the old hens. I recommend the pot in preference to the market, as the farmer will get more real money return in this way than by selling old chickens at ruinous rates, as the store-keeper is certain to force him to. L.

The Herdsman.

THE BOOM IN JERSEYS.

RICHARD GOODMAN.

LAST SPRING the first of the combination sales of horses and thoroughbred cattle of Kellogg & Co., took place in New York city, and was a decided success as to the Jerseys, of which alone I write for various reasons. Primarily the animals were all selected from the herds of the best breeders, who consented to spare some of their choicest cattle, and they were sold as belonging to such owners whose names, in connection with that of Mr. Kellogg, guaranteed that each animal was as represented. Secondly, at that time there was quite a furor, now dying out, about certain lines of breeding, and the judicious managers of the sale were careful to have several animals of those strains on hand for competition, and the result justified their foresight. Unexampled prices were given for a few cows, and the average of the whole sale was better than that for imported animals direct from the island of Jersey, and plainly proved that when the same care is taken to cull from home-bred herds the best products, as is taken by the dealers abroad, we can successfully compete with the latter, and that buyers of Jersey cattle are no longer ensnared by the word "imported" any more than ladies are in the purchase of silks for dresses, but that home production if equally good will be chosen in preference, and if better will always be in demand. The report was current that the Kellogg sale was under the fostering care of the American Jersey Cattle Club, but that was a mistake caused probably by the fact that Mr. Hand, the Treasurer of the Club, and a most competent judge of Jerseys, was in his individual capacity interested with Mr. Kellogg in the enterprise, and the success of the undertaking was owing in a large measure to their joint judgment and management.

Another sale under the same united direction has recently taken place—in the middle of October—and the results, so far as the Jerseys were concerned, was again a success, though there were no animals of any of the special "boom" strains and no such extraordinary prices as before for individual cows, but all were disposed of upon their real merits. The highest prices were for "Easter Flower," owned by Mrs. Jones, of Canada, a most enthusiastic lady breeder, who within a few years has got together an excellent herd of butter-making cows, whose product she utilizes with profit; and "Saumarey Lass," owned and imported by Mr. George A. Beck, of Stockbridge, Mass., a few years since, with many others, to stock his fine farm then recently purchased. Easter Flower brought $510, Saumarey Lass $430. The herd of the estate of the late William Redmond, whose farm was at South Orange, New Jersey—an early and prominent breeder of Jerseys—though showing that they had not received since his decease the same attention he was in the habit of having bestowed upon his favorites in his lifetime—sold for very fair average prices, and the herd bred with care by the late H. S. Parke, of Bayside, Long Island, and kept up in good condition by his executors, made the excellent average of $275 each, several ranging from $300 to $400 apiece.

The herd of Mr. Parke was an excellent example of judicious breeding from a well-selected bull—a continuance of the same struggle for excellence not only through one Summer but several seasons—and the uniformity of the herd in color, shape, good udders and other prominent "points" made it attractive to purchasers, and must have been gratifying to the amiable gentleman who was so earnest as a breeder and whose loss is so sincerely mourned by his associates. The bull "Golddust," imported by Mr. Parke through Mr.

Weld, was, as his name represents, golden-hued—a color which he invariably imparted to his progeny—with a hide delicious to handle, and though just in his prime, five years old, was sold for $45, whilst a male calf of his get a few months old brought $200! Mr D F. Appleton, one of the most enterprising of Jersey breeders, who seldom hesitates at the price, if what he desires in the line of cows or bulls suits him, and who was undoubtedly prepared to give six or eight times the amount actually paid for "Gold dust," if there had been any competition, was the judicious and lucky purchaser and all signs will fail if the product of his "Ipswich" herd during the next two or three years is not superior to its predecessors, notwithstanding the excellence of the blood and breeding already imparted. The remaining Jerseys were sold for fair prices, and no one could complain that the sale was not well advertised and managed nor that many, if any, desirable animals brought much less than they were worth.

Of course, this second sale was not intended to be a compeer of the first, but breeders were allowed to send such animals as they pleased to be sold only under their own names, and the prices they brought depended not only upon the reputation of their owners, but upon their actual merit and condition. "Easter Flower" was not a solid-colored cow, though she brought the highest price at the sale, neither is "Jersey Belle of Selmate," though her owner has refused to put any price upon her; yet the herd of Mr. Parke owed much of its beauty to its uniformly light fawn, and much as we may deprecate "giving away" any valuable qualities as a sacrifice to "color," there can be no doubt that, other things being equal, "solidity" is attractive to buyers, and that a herd of *good* animals of uniform color always makes an impression. But it is rare that one bull will so impress nearly all cows which receive his services as did "Gold dust"—though our lamented Lenox, whose *shade* we trust is now feeding in pastures new, had the like quality—but if a breeder is lucky enough to own such a one he can do no better than to hang on to him and use him so long as he can beget.

The lesson from these sales is that good animals bring good prices, and vice versa; that we have in this country as valuable breeding herds as can be found in the world; that not only breeders themselves, but all those dealing in Jerseys, are aware of the fact, and that with judicious management we can compete even at public auctions with any imported stock.

Lenox, Mass.

FANCY PEDIGREES AND INDIVIDUAL EXCELLENCE.

W. I. CHAMBERLAIN.

A JOINT public sale of highly bred Shorthorn cattle was held at Delaware, Ohio, October 21st 1880. The cattle sold were owned, and almost without exception bred by four parties, viz, C & F P. Hills, Hon. T. C. Jones & Son, T. L Harrison and Hon. T. F. Joy, and a printed catalogue, as is usual at such sales, gave full pedigrees of animals The Messrs. Hills & Jones are two of the oldest and best breeders in Ohio, while Mr. Harrison is a well known breeder of St. Lawrence Co., N. Y. and Secretary of the New York State Agricultural Society, and Mr. Joy has an excellent local reputation in Ohio as a breeder. The sale was conducted under the rules of the Ohio Short-horn Association, which fact alone would have assured perfect fairness in every respect, had it not been already secured by the known character of all the gentlemen concerned.

The animals sold were of excellent families or strains, but had not been put in special show condition at a large and worse than useless expense. They were in good breeding condition, and not pampered and grain fed in dark stables to put on luxurious fat and artificial gloss and color for mere fancy bidders at fancy prices. There was not a fancy or illegitimate figure obtained during the whole day, but rather a steady run of good and remunerative prices. The day of fancy prices is past in Ohio, but the day will never pass when the careful, honest, sagacious breeding of Short horns will fail to be remunerative. The total receipts for 89 animals actually sold, were, as I figure it, $11 045 or a shade over $124 per head all around. This price is good when it is known that two of the bulls were six years past, and that a large number of "young things" from four to ten months old were included in the catalogue.

While it is true that "*fancy*" pedigrees were not at a premium, yet nothing was more evident than that a straight and unbroken line of approved ancestry was in all cases deemed essential, and that any question on any ancestor even quite remote greatly injured the price of the animal on sale. It was a most intelligent and exacting crowd of bidders, and in every instance they seemed to demand two things, viz. individual excellence, and a good pedigree.

The Rose of Sharon family seemed, as a rule, to bring the best prices, but little preference being given to the Kentucky branch in the past of any animal. It was perfectly evident that neither pedigree nor premiums awarded in the past would sell an animal unless he individually filled the eye of the purchaser. For example, the eighth Baron Morley, 28 537, bred and owned by Mr. Harrison, had taken first prize as yearling bull and in prize herd in 1876 and as aged bull and head of prize herd in 1879, both at New York State fair, these two being the only times he ever was exhibited. But the animal himself did not fill the eye of the bidders, most of whom were naturally fastidious, and had, besides, seen the fine show of "aged bulls" at our late State fair and had had their eyes spoiled for anything not pretty near perfection, individually. And so, though the Baron had a good show record, and was line-bred Princess with but a single out-cross, he went at the ridiculous price of $60. True, his age was against him (six years past), but Duke Dunmore, 32,248 was six months older and had just sold for $300. But he was a straight Rose of Sharon of the Kentucky branch, and had a form and bearing that filled the eye of Short-horn men.

The most noted breeders of the State were at the sale, and replenished their herds with choice animals. Also several well known gentlemen from other States, as, for example, Professor S. Johnson, of the Michigan Agricultural College, who, being clearly a judge of cattle and having the State of Michigan to back him, bore off several of the very choicest animals offered. My footings of the sale, in round numbers, are:

C. & F. P. Hills	30½	head at $151	per head,	$4,600
T. C. Jones & Son	28½	" 115	"	3,285
T. L. Harrison	8	" 151	"	1,215
T. F. Joy	22	" 88	"	1,945
Total	89	124		$11,045

Hills and Jones owned the bull Duke Dunmore in company. Hence the "½" above. The animals were widely scattered by the sale among common farmers as well as breeders, and will do much towards grading up the dairies and herds of the State of Onio.

STOCK NOTES.

MESSRS. POWELL BRO'S., of Springboro, Pa., have for years been recognized as the most extensive importers of Clydesdale horses in America, and are also noted for the high quality and worth of their stock. We had the pleasure of inspecting their last importation of ten Clydesdale stallions landed from the Circassia, of the Anchor Line, from Scotland, on Oct. 31st. It is no disparagement to any others to say that these were pronounced by good judges the finest lot ever landed at this port. They not only had large size—several of them weighing over a ton each—but they also had unusual quality, style and action. They stood the voyage well. This lot are all registered in the Clydesdale Stud Book of Scotland, and are a great credit to the skill of Mr. Powell, as shown in their selection They are bays and browns. One of the lot goes to Smiths & Powell, Syracuse, N. Y. Messrs. Powell Bro's have made several large importations this season. They landed seven at Boston last week, and other lots shortly before; they have still other purchases to arrive.

Sheep Husbandry.

EARLY LAMBS.

THE breeding of these may be greatly increased and made one of the most profitable industries of American flock-masters. They are quick of sale, and command high prices in consequence of the rapid increase of the wealth and population of our cities. Since the introduction of steam engines into so many barns, for the purpose of grinding grain, cutting fodder and cooking roots, warm winter-quarters are easily made for ewes, in which they may safely lamb all Winter and rear their offspring. Thus they may begin to drop them early in November, and so continue comfortably housed till mild Spring weather.

Early lambs may be most profitably raised in conjunction with cows kept for the dairy; for to bring them forward rapidly and well fattened for market, it is generally necessary to feed them cows' milk in addition to what they draw from their dams, and the more especially if there are twins or triplets. The lambs can be taught to drink milk by the time they are four weeks old, or possibly a little sooner. Begin with a gill to half a pint morning and night, fresh drawn and warm from the cow, and go on increasing the quantity to the full extent of the lamb's subsequent appetite. Lambs can thus be grown large enough, and well fatted for the market when six to eight weeks old, and their flesh is then so delicate and savory as to command the highest price. Milk of the Channel Island and some other cows may possibly be found too rich for the lambs, causing them to scour; if so, dilute it with pure warm water before feeding. It might be best also to add a tablespoonful or two of oil meal or flaxseed gruel. When kept on longer, they can be fed a little flaxseed and oats ground together, raw cotton seed and oil-meal, and, at a suitable age, hay, roots, cooked or raw, and grain of some kind.

Much judgment and a little experience are required in feeding lambs, as well as other young stock. The great thing is to promote a rapid, healthy growth, at the same time keeping them from scouring. They are easily made to scour unless the food is of the right kind, and if too much at a time is forced upon them. Apartments for ewes and lambs should be kept well aired and clean. This is essentially necessary for their health, as sheep require a fresher and purer air than any other kind of domestic animals. In mild days they may be turned out into a dry yard for exercise a few hours, but never when the ground is wet or muddy. When lambs get to be two months old, if the weather be still cold, they and their dams can be gradually inured to sheds open in front to the south, but in case of a threatening snow storm or heavy rain, the lambs, at least, should be stabled or kept where neither snow nor drenching rain can reach them.

At the South, early lambs can be more easily and cheaply raised than at the North, for there open sheds only would be required to protect them, and green pastures may be had in abundance nearly all Winter for the ewes and the lambs also to nibble as soon as they got old enough to do so. But even there we would recommend, if desired to push them forward rapidly, feeding milk as above stated and cotton-seed meal, as oil-meal or flax-seeds not so easily obtained, and both are dearer there than at the North, while cotton-seed meal is much cheaper. The lambs at a suitable age can be quickly transported by steamers to Northern markets, and insure on their sale a profitable return to Southern farmers for their breeding and rearing. They would also give them plenty of fresh meat at home, and thus avoid their being so confined as they now are to salt pork and bacon.

As to the best breeds of sheep to produce early lambs, the different sorts of Downs, and especially the pure South Downs, are preferred in England, and it should be the same here. But crosses of these as well as those of the various kinds of long-wooled sheep answer an excellent purpose, and may be largely and profitably used. On lean grade Merino and native Southern ewes, perhaps the first cross of a Cotswold, Lincoln, or Leicester ram may be best, but one should rarely go beyond one cross, otherwise the lambs might be too fat for delicate eating.

As these three latter breeds are of extra-large size, care should be exercised to select as roomy ewes to breed to them as possible, and also to select the smallest and most compactly formed rams of their breed for this purpose, otherwise the fetus would be so large as to make yeaning dangerous. Unless such care is used in coupling sheep, both dam and offspring are often lost. We are aware that it is said the bones of long-wooled rams are so fine in proportion to their size, that little is risked in coupling them with quite small ewes; but those most experienced in such breeding declare that there is more or less danger in it, and we therefore caution our readers to be careful in making selections for their flocks.

Other breeds of sheep besides those we recommend above are used in England for the production of early lambs, such as the Dorset, etc; but they are smaller and not so hardy and thrifty, and, moreover, have horns, which are quite objectionable in mutton sheep. These may be called rather fancy animals than otherwise. We believe that the system of raising early lambs was first begun in Dorsetshire, England, and thence has gradually spread over the United Kingdom.

As poultry begins in late Winter and Spring to diminish, in the meat markets, nothing is found equal to early lambs to supply its place, and we trust their numbers may be rapidly increased hereafter for this highly desirable purpose.

MUTTON SHEEP.

No doubt this class of sheep is destined to take the same precedence among us, in the course of a few years, as it has long since taken in Great Britain. Mutton there is much more largely consumed than either beef or pork, and, when coming from the right sort of sheep, it is more savory than either and more healthful than the latter, particularly in summer weather. It can be produced more cheaply than beef or pork, and we have only to give due attention to breeding such sheep as supply mutton of the best quality, to increase its consumption rapidly among our people, and also its exportation.

As to the breeds of sheep for this purpose, the various classes of Downs are unquestionably preferable; and they are so hardy, prolific and early to mature, that they may be made, with proper attention, to stock the country rapidly.

Next best to the Downs as mutton sheep, are the numerous crosses made by their rams, as well as by those of the larger-sized long-wooled on native ewes. When this produce becomes well fixed in that type which particular districts prefer for their regular breeding, then the males and females of these crosses may be put together, and serve to stock the several localities as desired by their occupants.

For a breeding flock farmers should pay special attention to selecting such only as are of strong constitution, good form, hardy, quick feeders, and early to mature, coupled with as valuable a fleece as possible, although this is of secondary consideration. The possession of all these qualities in a breeding stock, is of the utmost importance, and should be carefully considered in each individual sheep; for the better or worse they may be, the greater or less will be the profit realized out of the flock. When anyone has not sufficient confidence in his own judgment to make a proper selection of breeders, he should avail himself of the services of a friend who is capable of doing it for him, as he may be assured this is well worth the extra trouble and moderate expense such a course may be to him.

Feed is the next thing of importance, and in giving this be careful that it is such as will keep the sheep at all times in good store order; not over-fat on the one hand or lean on the other. If too fat, neither males nor females will produce as many or as strong lambs as when fairly kept, nor will their offspring be so hardy and thrifty. The milk of over-fat ewes is liable to give their lambs the scours, while that of the lean is not sufficient for their full nourishment. Thus, in both cases, the growth of the offspring is checked, and they never can be made as good sheep as if they had been properly nourished when young.

Of the best kind of feed for store keep or fattening sheep every farmer must learn to judge for himself, and act accordingly, for this varies with the climate, season and weather. Take, for example, a hilly pasture in dry weather. The grass then will be scant, wiry and so hard of digestion as not to furnish sufficient nourishment for the flock. If then it can be brought down at evening to richer land, growing a more succulent herbage, and hurdled there till morning, this will assist in digesting the drier food of the day, and fill their stomachs with all that is necessary to keep the sheep in good condition, or even fatten them for market.

Again, during a superabundant fall of rain, grass becomes so rank and watery that if eaten too freely it causes scours. The flock ought then to be fed partly on dry hay or straw, if they will eat it, to correct this looseness, and in any event have a moderate ration mornings and nights of linseed meal or flax-seed ground half and half with oats. When fed roots in Winter the same ration should be added, which will generally prevent scouring.

One great consideration to the farmer in keeping sheep is, that the carcass is so much smaller than that of the bullock that he can easily supply himself with fresh meat. This is not only more palatable and healthful than salt meats, but the consumption of it in hot weather is nothing like such a provocation of thirst as the latter to all out-door laborers. When families are small, neighbors can take turns in furnishing a carcass of fresh mutton to be divided among them, or, if the family is large, the meat can be kept in good order till consumed, especially if there is an ice-house in which to store it. Such every farmer ought to have, not only for this purpose, but for various others, which add so greatly to the comforts of all during hot weather.

Mutton has advanced in price in Great Britain during the past few years considerably more than beef or pork, in consequence of the enormous destruction of sheep there from various causes during this time; it will consequently take several years to fill up this gap. In the meanwhile, our own population is rapidly increasing, and the taste for good mutton with it, thus making an extra market both at home and abroad for our flock-masters. They will now see that they have every encouragement in the future, not only to improve their sheep, but also to add largely to their numbers.

MOUNTAIN SHEEP produce the choicest flavored and tenderest mutton and a very valuable wool for domestic purposes. For instance, the Welsh mutton produced in the mountains of Wales is sold by English confectioners as a delicacy, and the Welsh flannel is the best of its kind, never shrinking and hardly ever wearing out. Everybody has heard of Shetland wool, which is made into ladies' knitted shawls of strange devices, and into the softest hose and underwear. And the Shetland sheep are exposed on those bleak storm-swept moors in those rocky isles of the northern ocean which we should think uninhabitable. The Cumberland mountain sheep, the Herdwick, and the Scotch black faces, which feed on the rocky Gramplans, are also noted for their useful wool, short but strong and soft, and of the warmest, fleeciest kind, and are by no means small, for they reach a weight of 130 pounds.

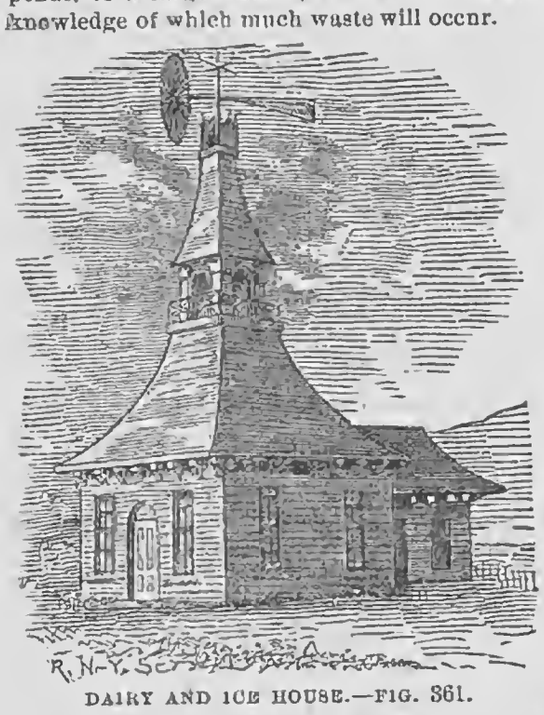
Dairy Husbandry.

THE DAIRY COW. NO 15.

HENRY STEWART.

The Use of Ice in Dairies.

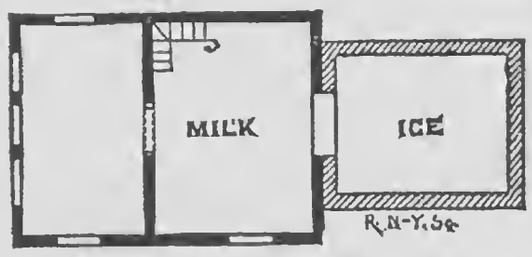
THE use of ice is one of the modern improvements and has done more than anything else to raise the quality of the butter made in dairies. A family dairy can scarcely be conducted successfully without the use of ice; the milk dairyman finds it indispensable; and the butter maker who desires to produce a fine quality of goods cannot dispense with it. The consumption of ice is regulated by a few precise conditions upon which its economy depends, to a large extent; and without some knowledge of which much waste will occur.



DAIRY AND ICE HOUSE.—FIG. 361.

The most economical use of ice is when it is applied directly to the cooling of the milk alone, and is not wasted in cooling the surrounding air or the readily conducting walls of ill-adapted vessels or receptacles for the milk. Probably the most convenient manner of using it is in a non-conducting refrigerator, closet or tank of the kinds which have been heretofore described. In using these it is well to remember that once the water or the air in the tank, or closet, and the substance itself of these, have been cooled to the lowest degree, the greatest economy consists in preserving the low temperature by keeping up a supply of ice. The loss of ice by conduction from a well constructed closed refrigerator is very small; but if this is left open when not in use, a considerable quantity of ice will be required to cool it down again, and this waste is loss. One pound of ice will cool one pound of water of 174 degrees to a temperature of 32 degrees. In other words, one pound of ice in melting absorbs 142 degrees of heat. This is known as the measure of the latent heat of water at 32 degrees, and which must all be given off to the atmosphere before the water can become completely changed to ice. It may be said, then, that water absorbs cold, which is the same thing practically, as giving out heat; and this result may often be turned to good account in milk rooms or dairies in cold weather, to prevent the milk from freezing, by putting a tub of warm water into the dairy. The water will freeze before anything else, and in freezing actually warms the air and contents of the dairy, or rather, in reality, takes up all the cold in excess of 32 degrees, until it is frozen.

One pound of ice, therefore, in melting, will absorb sufficient heat to reduce four pounds of milk from 80 to 45 degrees; and if a good refrigerator is used, there will be little loss of



MILK AND ICE ROOMS.—FIG. 362.

ice in overcoming the waste from the cooler. The quantity of ice to be provided may therefore be readily calculated, by considering that every pound melted, will take 142 degrees of heat from a pound of milk; 71 degrees from two pounds; 47 degrees from three pounds; 36 degrees from four pounds; or eighteen degrees from eight pounds. If therefore the milk is first set in cold spring or well water, and reduced down to 60 degrees, one pound of ice will then be able to reduce nearly 10 pounds of it to the still lower and perfectly safe temperature of 45 degrees. At this temperature the cream may all be raised from milk in 12 hours, and milk may be kept sweet for 72 hours or longer.

An ice house and a supply of ice will be found indispensable to every well conducted dairy from a one-cow establishment up. The supply of ice may be procured without difficulty by throwing a low dam across a small stream, and collecting the water in a pond, or by excavating a pond, where there are no other means of getting it. A cubic foot of ice weighs about 55 pounds, or one ninth less than water. A surface of less than 80 square feet of ice six inches thick will yield a ton, and a pond of a quarter of an acre will therefore give 136 tons with ice of this thickness only. The ice house and dairy should be contignous and yet separate. The communication may be by a double door, as in the plan here given, in which the ground floor and elevation of a building proposed by the writer and built by a Western dairyman, are shown. The ground plan includes a churn-room with a milk-room attached, and an ice house in the rear communicating by double doors. The dairy is intended for the use of portable creameries and is supplied with cool spring water from a well under the floor, to which a windmill is attached. A connection with the windmill operates the churn. The upper story is used as a store room for butter pails and spare utensils, and is reached by a stair-way in the milk-room. This upper story provides excellent ventilation in the milk-room. The method of construction of the milk room, as regards floor, light, etc., and of the furnishing, is similar to that previously described and need not be repeated. The construction of the ice house is of sufficient importance to occupy the next chapter.

AMONG THE CREAMERIES.

IT is not many years ago—not a score of years at most—since the farmers of Orange and Chenango Counties manufactured the butter and cheese from their dairies of 20, 30 or 40 cows, storing it carefully through the Summer, sure of securing a good price for the entire stock in the Autumn. Times have changed. Creameries have started up everywhere. Instead of a score or two of dairy women engaged in butter making, one deft-handed maiden does the work of all. The creameries of Chenango County are thickly scattered over hill and valley throughout its entire extent. They do not attempt to compete in size with the mammoth Western creameries, which have taken away the reproach of the old-time Western butter. From two hundred to six hundred cows are perhaps the usual number for a Chenango County creamery. Let us look in upon one where the milk of more than 400 cows is manufactured into butter and cheese.

The building is situated in the valley of the Unadilla, near the base of a hill from which an abundance of pure cold water is brought in large iron pipes. The large cheese room is furnished with counters which fill all the space, and extend over the entire room. The rooms below are three: first, the "make room," containing two huge tin vats within wooden vats for cheese making; a gang press where 15 cheeses are pressed by one screw; an old-style press for four cheeses, and a steam-engine. Second, the churn room, where four two-barrel churns are worked by the engine in the room below, and huge stacks of "white clover" creamery pails and a butter worker complete the furniture. Third, the milk-room filled along its entire length with large tin vats standing in larger vats filled with water. Opening from this room is the platform where the milk is lifted from the wagons by a windlass and huge iron tackle, poured into the weigh can which stands on large Fairbank's scales, and is thence through tin conductors carried to the milk or cheese vats.

If "full stock" cheese is to be made, the milk is carried at once to the cheese vats, rennet, etc., added and the whole brought to a proper temperature by heated water around the vats from the steam-engine. Then, when the curd is formed, it is cut by curd knives, perpendicularly and horizontally, into small squares, scalded and salted, the whey drawn off, the curd ground through a curd mill, and then packed into hoops and placed in the press. If half-skim cheeses are to be made, half the milk is allowed to stand in the vats for 12 hours. The cream from this is slightly soured, and churned the following morning. The cream being at the exact temperature required—58 to 60°—and the motion of the churn dasher steady and exact, the golden globules appear in about 30 minutes. The butter is washed in cold water, salt is added and in a few hours the butter is worked through the patent worker, and packed in pails, a gilt-edged article. Everything about the creamery is clean and sweet. The forewoman has one male assistant through the entire season, and a second through the press of work. The most perfect cleanliness is exacted, and the air is as sweet as in a Jersey woman's dairy. In many creameries large pools of water hold the "coolers"—deep pails in which the milk is placed.

Creamery butter brings in market from three to ten cents per pound more than dairy butter, a most potent argument in favor of thus uniting the small dairies into one where a perfect article is made. Western butter it was once thought would never interfere with State; creameries have proved this opinion a fallacy. Near Elgin, Illinois, forty creameries scattered over the prairies gather up the milk so easily produced, and manufacture an article rarely equaled. So with as good a grace as possible we have only to resign ourselves to the inevitable, thankful for the institution of creameries. MRS E. J RICHMOND.

Industrial Societies.

VIRGINIA STATE FAIR.

[Rural Special Report.]

THE 20th annual exhibition of the Virginia State Agricultural Society, opened at Richmond on October 25, and the exhibits, both in variety and quantity, were fully equal to those of former years. The weather during the entire fair was pleasant, and no rain interfered to trouble the exhibitors or prevent a large attendance. The fair on the first two days was poorly attended, farmers and others preferring the circus and other outside attractions. On Thursday and Friday, however, the attendance was very large, and the receipts sufficient to place the fair on a paying basis.

The grounds of the society are fine, and well laid out. The location is good and easy of access; and, with a few additional buildings, now in contemplation, this Society will have grounds of which it may justly feel proud. The officers spared no pains to accommodate the exhibitors, and their efforts in this direction have met with universal approval and made many warm friends. Owing to the absence of a suitable house for the shelter of poultry, comparatively few coops were shown, but what was wanting in quantity was made up in the quality of the birds exhibited, and thus this department was far from a failure. Some very fine Houdans, Light Brahmas, White and Brown Leghorns, Plymouth Rocks, Golden and Silver Pheasants, Cayuga, Rouen and Pekin ducks, Games, Bantams, etc., attracted large crowds of visitors.

In the Stock Department the entries showed forty-six head of Jerseys, forty-four Shorthorns, twenty Devons, seventeen Ayrshires, six Holsteins, fourteen grades and a few Herefords. Of farm horses only a few Clydesdales and Percherons were shown, and these were not extra-fine specimens of the breeds. The Agricultural implement exhibit was one of the largest ever shown on the grounds, local dealers especially seeming to vie with each other in the quantity and variety of their exhibits of implements of which they were the manufacturers or general agents. The Baltimore Plow Co. had a variety of their plows on exhibition in which they met with sharp competition from local manufacturers and dealers. A string-binder manufactured by the Walter A. Wood M. and R. M. Co., was run by an engine manufactured by Wm. E. Tanner & Co., of Richmond, and was especially admired by all who examined its perfect operation. Space will not admit of a minute account of all the implements exhibited, but we give below a brief description of the implements and machinery which were especially noticeable.

MR. M WILLIAMS, St. Johnsville, N. Y., had on exhibition a thrasher made by him, and sold during the past season to Mr. Morrison, Fredericksburg, Va. The thrasher was shown in full operation, and the purchaser informed us that he had thrashed 15,000 bushels of grain with it during the past season, and that entire satisfaction was given in every case. So great has been the demand for these separators that the manufacturer has found it necessary to enlarge his works in order to supply his largely increasing business, and hopes to be able to fill all future orders with promptness.

MR. W. HUTCHENS, general agent of the Baltimore Plow Co., Baltimore, Md., exhibited a full line of the Roland chilled plows, from a single to a four-horse implement. These plows are of the latest improved patterns of chilled plows, and the sales during the past season have exceeded anything ever before known in the history of the company. They are now using the celebrated Bower's patent reversible point, which is claimed by the manufacturers to be the most advantageous and economical improvement ever made in a plow.

MR. V. WETHERILL exhibited the "Little Giant thrasher and cleaner," manufactured by Messrs. Heebner & Sons, Lansdale, Pa. This company has been in business since 1840, and their long practical experience of the needs of farmers in this line and the best way of meeting them, has enabled them to place a first-class machine upon the market. Among the many points of excellence of the "Little Giant" we notice an iron cylinder, a new iron concave, a patent duster and a self-adjusting wind regulator, and steel teeth, which combine with other meritorious points to make this separator *all* that the manufacturers claim for it.

NEW JERSEY AGRICULTURAL WORKS, Trenton, N. J., exhibited the Butterworth thrasher and cleaner. This separator is supplied with adjustable boxes throughout, which entirely prevent all lost motion; this is effected by simply setting the set-screws. This separator was a center of attraction, its noiseless motion being particularly admired. It won the highest prize—a silver medal—at the North Carolina State fair, held at Raleigh Oct. 19–23, 1880.

W. H. BROWN, general Southern agent of the Empire Grain Drill Co., Shortsville, N. Y., had on exhibition one of their force-feed fertilizer drills. As the principles of *force feed* applied to the sowing of fertilizers is a novelty in this class of machines, the "Empire" attracted the attention of a great many farmers, and its meritorious points were shown up by Mr. Brown much to the satisfaction of all who carefully examined its workings. G. B. B.

BIG GIANT CORN AND COB MILLS. In noticing these at the St. Louis fair we neglected to report that they were awarded the first premium over all competitors. This is the third year in succession that these celebrated mills have carried off the first premium at the St. Louis fair. They were also awarded the first premium at the Baltimore, Md fair and at every place where they were exhibited this year. Their new cast-steel grinders are a valuable improvement. At a recent trial the Big Giant No. 1, which is the smallest size, ground one bushel of ears of corn in four minutes with one mule, showing a draft of 110 pounds. This was the best record in the trial—and shows a remarkably light draft in comparison to the work done. K.

The Apiarian.

THE DRONE BEE.

THE drones are bees of larger size, stouter, and more squarely built than the workers. They commonly make their appearance in the hives in April, May and June; and are usually expelled from the colonies by a summary process in July or August. The head of the drone is much more spherical than that of the worker, the body is more bulky and hirsute, and the abdomen terminates more obtusely. Drones fly more heavily and make a louder humming than the workers when on the wing. But their apparently most distinguishing characteristic is the want of a sting, which constitutes the formidable weapon of the worker, and with which even the queen is armed.

Singularly contradictory opinions respecting the sex and functions of this kind of bee have been entertained by eminent apiarians, and are still cherished and advocated by some recent writers. Some, indeed, go so far as to refuse to acknowledge them to be natural and necessary members of the busy commonwealth, regarding them rather as misbegotten monsters or parasitical intruders. Such extravagant notions scarcely deserve notice otherwise than as curious vagaries not seriously requiring refutation. The workers build the cells in which the drones are bred; and the queens, in healthy colonies, lay the eggs from which they are hatched. They and the workers are the off-springs of the same mother, and have an equal claim to be regarded as constituent members of the community.

But, conceding their rank and equality, of what sex are they, and what is the design of their brief and moononous existence? They are the male bees, and are hatched from unimpregnated eggs. The function of the drone is solely to impregnate the queen. Without this the queens would remain barren, and the race could not be perpetuated. Bees are well aware that drones are absolutely indispensable in certain conditions of the colony. At the very time when, from want of pasturage and the unfavorable state of the weather, other colonies will destroy even the drone larvæ, those which are queenless and engaged in rearing queens will cherish their drone-brood as carefully as they do the royal cells. Strong colonies alone and such as, in the consciousness of increasing numbers, contemplate swarming, produce drones. After the swarm has departed, and when the young queens are making their nuptial excursions, the drones are always most numerous. True, a colony which does not swarm, or rears no queens, would have no occasion for drones. But as the contingencies which may prevent swarming cannot be foreseen, drones are, nevertheless, produced, because in the event of being wanted they could not be suddenly bred.

Just what the longevity of the male bee is, I am unable to state. It is probable, judging from analogy, that they live till accident, the worker bees, or the performance of their natural function cause their death. The worker bees are liable to kill off the drones, which they do by constantly biting and worrying them. They may also destroy the drone brood. It is not very rare to see workers carrying out immature drones even in Mid summer. At the same time, too, they may destroy inchoate queens. Such action is prompted by a sudden check in the yield of honey, and in case of the drones it is most common at the close of the season. The bees seem very cautious and far-sighted. If the signs of the times presage a famine, they stay all proceedings looking to the increase of colonies. On the other hand, unlimited honey, rapid increase of brood, crowded quarters—whatever the age of the queen—are sure to produce many male bees; while any circumstances that indicate a future need of drones will prevent their destruction even in late Autumn. LIGURIAN.

Scientific and Useful.

NEW JERSEY AGRICULTURAL EXPERIMENT STATION.

IX.

THE following analyses are those of different fertilizers which have been sent in to the Station at the close of the present season.

Samples 71, 73 and 72 are of the same brand as 58, 59 and 60 of bulletin VIII. A second set of samples has been analysed, as Mr. Pancoast was not satisfied that those first made fairly represented the stock.

1.—BONE MANURES.

	68.	71.	75.	77.	88.
Nitrogen in organic matter	4.79	2.12	3.83	3.88	3.01
Total phosphoric acid	15.69	15.74	21.54	20.51	14.84
Estimated value	$36.41	27.28	40.01	36.79	27.89
Cost in market	$36.00	33.00	2.50	36.00	27.00

68. Ground slug. Manufactured by the Elizabeth Glue Co. Sampled by Chas. E. Little, Elizabeth. This is the bony substance of horn cores, ground.

71. Raw bone. Manufactured by Thompson and Edwards, Chicago, Ill. From stock of I. W. Pancoast, Sharpstown, Salem Co. Sampled by Jesse Lippincott, Woodstown.

75. Ground bone. Manufactured by Harrison Brothers & Co., 105 S. Front Street, Philadelphia. Sampled and sent by Joshua Waddington, Salem.

77. Paterson and Jones raw bone. Sampled by Joshua Waddington, Salem.

88. Ground bone. Manufactured by the Preston Fertilizer Co., Greenpoint, L. I. Sampled by C. C. Van Doren, Franklin Park.

2.—SUPERPHOSPHATES OF LIME WITH POTASH.

72. Ammoniated superphosphate. Manufactured by Thompson & Edwards, Chicago, Ill. Sampled by Jesse Lippincott, Woodstown, from stock of I. W. Pancoast, Sharpstown, Salem Co.

73. Dissolved bone meal. Manufactured by Thompson & Edwards, Chicago, Ill. Sampled by Jesse Lippincott, Woodstown, from stock of I. W. Pancoast, Sharpstown, Salem Co.

84. King Crab fertilizer, from stock of Nathan Pancoast, Moorestown. Sampled by Geo. L. Gillingham, Moorestown.

87. Ammoniated bone superphosphate. Manufactured by Preston Fertilizer Co., Greenpoint, L. I. Sampled and sent by C. C. Van Doren, Franklin Park.

GEO. H. COOK, Director.

New Brunswick, N. J., Oct. 16, 1880.

Miscellaneous.

BRIEFLETS.

THE double lilacs—who has them for sale in this country?. . . . . The California Privet, as it is called in some catalogues—Oval-Leaved Privet as it is elsewhere and more properly called, its botanical name being Ligustrum ovalifolium, is everywhere liked. It will thrive in all sorts of soil—on gravelly hills—on lake-sides. The leaves are broad, thick and shiny and the bushes are symmetrical, green and beautiful. They are often cut back by Winter's severities, but their growth is so strong that they quickly recover in the Spring. For hedges, for parts of the garden of secondary interest, for school yards and church yards, for parks and city gardens, this shrub is just the thing. . . . . Mr. C. M. Hovey remarks in the London Garden to which he contributes some very interesting American horticultural notes: "It has surprised me that in the profusion of donations which Harvard University annually receives, there should not be found one single giver who puts any interest in, or cares anything about a garden." Possibly those who might make liberal donations are, as Mr. Hovey seems to be, more interested in English horticulture than in that of their own country. . . . . The Prairie Farmer refers to the pleasant circumstance recently noted in these columns that ex-Gov. Furnas has been "caned." And he deserved it too! . . . . . It seems to us that the quality (flavor) of the Niagara Grape is very like that of Mr. Campbell's Lady. But the Niagara has the stronger skin and does not crack. . . . . The engraving of the Lady in Mr. Campbell's catalogue is one of the few that does not in any way exaggerate its actual appearance. . . . . St. Louis, it appears from Colman's Rural, is Chicago's chief outlet for its cabbage crop. St Louis consumes it in kraut-making and pays an average of six dollars per 100. We wish Long Island could be assured of such a price. Cabbage-raising would take the place of wheat and corn. . . . . We learn that several seedsmen and nurserymen are at work upon catalogues for the Spring which shall be more accurate and elaborate than any they have previously issued. We are glad to hear it and shall take special pleasure in calling the attention of our readers to all that concerns them. If the RURAL NEW-YORKER gives us pleasure more from one source than from others it is that we know it is exerting a wide and lively interest in new fruits and plants of special merit. . . . . For those having small greenhouses or window gardens, it is well to keep on hand a quart or so of pure liquid manure from the stable. Add lime to neutralize the odor. Use a tablespoonful of this to a gallon of water for the plants, to be used every two weeks during the Winter. . . . . Among the very best of plants for the Winter garden are geraniums, carnations, fuchsias, justicias, bouvardias, ivy geraniums, vincas, lobelias, camellias. These will all do well in a cool temperature—say 60 degrees. . . . . It appears from the California Horticulturist that the Cuzco Corn from which so much was expected in that climate, has disappointed the many who planted it. "As a rule no startling success has been anywhere obtained." It is suggested by a Frenchman that one cause of failure is that the female flowers are not ready to receive the pollen until the males ones have dried up. . . . . One of our friends who has been reading a good deal about the adulterations of all sorts of foods, comes to the conclusion that "this world is a very dangerous place to live in." . . . . The editor of the N. Y. World says that "the time has come when quality is exacted rather than size and that many prefer to have served on their tables two turkeys of moderate size than one of extra-large proportions. . . . . A poem in Harper's for September closes thus:

What compensation has a man
Who earns his bread by sweat of brow,
If home is made a battle-ground,
And life one long, eternal row?

Cuttings of many hardy plants may now be made. Select stems of the past season's growth—that is, growth of the Summer of 1880. Make them from six to 10 inches long, the lower end being cut off just beneath a bud. Currants, gooseberries, grapes; many kinds of hardy shrubs, such as honeysuckles, viburnums, spiræas, weigelas, elders, deutzias, lilacs, &c., may thus be easily propagated. . . . . Such cuttings may be placed in narrow trenches of mellow soil only permitting the upper end to appear above the ground. Then cover with hay, straw or long manure. In the Spring they may be set where desired or in nursery rows for future use. Such cuttings may be stored in boxes of sand in the cellar, but care must be taken that they be kept sufficiently moist to prevent shriveling and not wet enough to induce decay. . . . Whether they be planted separately or in rows, the ground should be rich, mellow and well compacted about the lower end. Such plants as the blackberry, many of the raspberries, the Great Panicled Hydrangea, Sweet-scented Shrub, ornamental quince, and many others may be propagated from root cuttings. They should be two or three inches long, a quarter-inch thick. Pack these in boxes of sand and treat them as recommended for stem cuttings. . . . . The New York Sun took us to task for stating that the Japan Persimmon would not fruit in this climate. Now this paper states: "We doubt whether this fruit can be produced in the North." Had it been better informed, it might, perhaps, have saved its readers a penny or so. . . . . We want all of our readers to read the articles under Farming for Boys and Girls in the Youths' Department. Most of our readers, whether old or young, will find that there is something in each one worth reading. . . . . "During the three seasons in which we have now grown Silver Chaff Wheat," says Mr. Thorne of the Ohio University, "it has given proof of being a most valuable variety." See his article in another column. . . . . It is suggested that a suitable opening for many choirs would be, "Oh, Lord, have mercy on us miserable singers." . . . . . One of the best traits of the Niagara Grape is that it will hang upon the vine for a long time after it is ripe without being injured in any way. . . . . The farm tool-house should never be without a coil of copper wire. . . . . Clear up the cellars. Allow not one particle of decayed vegetable or animal matter to remain. Then whitewash every part that can be whitewashed. . . . . All shrubs or trees about the house which have not made a satisfactory growth the past season should now have a dressing of manure. If growing in sod, bone flour and wood ashes or fine manure may be used. . . . . Remember that the best feeding roots of plants are not those nearest the stem. The best feeding roots are oftenest those furthest from the stem. Spread the fertilizer accordingly. . . . . "Any good shooting on your farm?" asked the hunter of the farmer. "Splendid," replied the agriculturist, "there's a drive-well man down in the clover meadow, a cloth peddler at the house, a candidate out in the barn, and two tramps down in the stock-yard. Climb right over the fence, young man, load both barrels and sail in."—Burlington Hawkeye. . . . . The girl who can climb trees can gather the prettiest Autumn leaves, but it is the smart girl who takes a young man along to do the climbing.—Phila. Kronikle-Herald. . . . . Mr. Mapes remarked while husking Blount's Corn the other day, "I'd rather do this than to see Sarah Bernhardt." . . . . . To what extent the fertilizer used upon Blount's Corn made the husking more entertaining to Mr. Mapes, it would be cruel to surmise. Our own opinion is that Mr. Mapes either likes to husk corn as an amusement or that, for some reason, he does not like Bernhardt. . . . . The Michigan Farmer deems that man happy who eats home-made butter. He alone can be sure he is not lubricating his bread with lard, tallow, suet or soapstone. . . . . The Millstone, the first journal of its class in this country, copies from the Fair Number our article on Wheats with illustrations. We are much obliged for the Millstone's very complimentary allusions to the work of this journal. . . . . Autumn leaves—after November. . . . . Archdeacon Denison thinks that the artificial drying of cheese, and, indeed, all factory processes, are to be abhorred. He declares that a real Cheddar should not be eaten under 18 months or two years from the date of making. . . . . There is no better time of the year to drain land that needs to be drained than now. . . . . Rainy, squally, snowy, stinging weather may be looked for at any time—hurry up corn husking.

CATALOGUES, ETC., RECEIVED.

ENSILAGE OF GREEN CORN, from the French of Auguste Goffart, with the latest facts connected with this system. By J. B. Brown. Published by the New York Plow Co., 55 Beekman St., New York. While we commend to our readers this book which contains all needed information upon the subject, we believe that the advantages of the system have been greatly overestimated and that it will never be popularly adopted in this country.

PRICE LIST of Hardy Grape-vines, etc. Geo. W. Campbell, Delaware, Ohio. We find in this Ricketts's Jefferson, Lady Washington, El Dorado, Highland and Welcome offered. It was our impression that Mr. Burrow as yet controlled the sale of the Jefferson.

WHAT OTHERS SAY.

WHEAT YIELD DECLINING IN ENGLAND.—Commenting upon the wheat reports the Live Stock Journal of England says: "A third and disagreeable fact which appears too clearly, is that the "average" crop per acre is *sensibly diminishing*, in spite of more expensive methods of cultivation. In 1870 it was reckoned at 29½ bushels, on an average of the then past five years. But in the last ten years the average has been only 25¼ bushels, and during the last *six* years it has been only 24⅛ bushels.

The last important fact we shall gather from the interesting figures before us is the rapidly decreasing value per acre of the wheat crop. The decline here is the most startling of all, and though we have clearly shown it before, and endeavored to point out its inevitable lessons, we are glad of another opportunity to put the facts in a striking light. For the five years ending 1870, with an average of 29½ bushels per acre, the average value of wheat to the farmer (after paying for seed) was £8 7s. 10d. per acre. For the last nine years it has been only £6 12s. 2d., and for the last five years only £5 18s. 3d. This was reduced by the small yield in 1879; but if the average price remains at 40s., even the better harvest of this year can only yield £5 10s. to £5 12s. 6d. For reasons we have given in past issues, we trust the average price will be a little better than this; but allowing, say, £6 per acre, it is impossible to show how wheat is to be grown at a profit at this rate, save, perhaps, on the large scale and the continuous system, as carried out at Wolston. On the ordinary arable farm, it clearly appears that wheat can at present only be grown at a loss.

THE moral is obvious, the Journal continues in another part. The pressing—the crying necessity—is to find *a general substitute for wheat as a straw crop*. . . . . To make money by wheat is utterly hopeless for the present, and the want of the times is a system which will, without injury to the land or other crops, throw wheat *generally* out of the rotation. The sooner this necessity is understood and faced, the sooner is farming likely again to pay its way.

WATERMELONS IN CALIFORNIA.—The immense yield of the watermelon vine in certain parts of California, and the peerless quality of the product, are both well-known facts. The Pacific Rural Press says that the average melons weigh from 25 to 29 pounds each. There are large numbers left in the field after the marketing season, and from these the seed is taken and sold at a fair profit. Growers have hoped and expected that their surplus might be turned to account in sugar making, but the analysis of Lodi melons made last year by Prof. Hilgard did not favor the project. . . . . This year fine handsome melons, of at least 30 pounds' weight, were sold some days as low $3 per 100, and retailed about San Francisco for five cents each.

PEAR BLIGHT.—D. B. Weir has this to say upon pear blight, in the Prairie Farmer:—"For one, after having given the subject much study, I have no faith in finding any cure for a cryptogamic parasite that preys upon a vital part of any vegetable, for many and good reasons, among which are these: First, in its inception it is generally entirely hidden from our view. We cannot see it or know of it practically until it is too late to cure. Secondly, it kills and utterly decomposes as it pervades. The most skillful physician in the world cannot cure a man with a disease the most easily controlled, if he does not see him before he is dead; no more can you cure a pear tree with its most vital tissues not only dead but decomposed. Prevention then, so far as pear blight is concerned, is all we have to study. Can we prevent it? I am confident we can, to some extent, both by proper systems of cultivation and medication. These are points I do not wish to treat on at present, but will simply say that if I have learned anything about pear blight correctly, many of the things recommended by some in case of blight—such as cutting off diseased branches, slitting the bark, thereby making fresh wounds—are exactly wrong. My experience is that anything that wounds the bark or weakens the vitality of the tree renders the tree liable to blight.

THE most profitable orchard that the Country Gentleman ever saw, over twenty years old, was on a very fine piece of land, with deep and well drained soil, cultivated, and regularly and moderately manured. It occupied seven acres, and from it the owner paid the heavy debt on his hundred-acre farm, and placed several thousand dollars at interest. He could not have done this on a rugged hillside.

HOGS will pay, taking the years together, the Western Rural thinks. There is going to be a constant increase in the consumption of pork, and the increased demand must be supplied. If bad luck comes one year or two years, there is an aggregate of good luck awaiting you in the end.

PHYTOLACCA DECANDRA.—"A correspondent lately asked us (London Chronicle) if this singular and handsome plant, the berries of which are so conspicuous at this season, was poisonous. We presumed not, but had no certain knowledge. We now find from an

article in the American Gardeners' Monthly that in New England the young shoots of the Poke-weed are considered a very delicate vegetable, and are, during the Spring months, always to be found on sale in the markets. The young, succulent shoots, when from four to six inches in length, are cut off near the ground, tied in bunches, and offered for sale in the same manner as asparagus."

THE NEW ENGLAND FARMER remarks that cider, made very late in the season and stored in a cold place, will keep sweet because active fermentation is prevented. If it is rich and sweet when it comes from the press, and care is exercised in making it from good, sound apples, it will not become sour if kept in a moderately cool cellar in a tight cask or in bottles.

THE CABBAGE WORM.—To save his cabbages and as an experiment, Mr. Howard tells the Fruit Record that he mixed four quarts of air-slaked lime, one quart of fine salt, and a quarter of a pound each of red and black pepper. When the dew was on he applied this mixture by means of a large-sized tin pepper box to 400 cabbages, that were doubtless as wormy a lot as could be found. He gave them but one dose, but it did its work so effectually that there has been no further trouble on account of these destructive pests.

HOW TO GROW EXTRA YIELDS OF CORN.—The efficient editor of the agricultural columns of the N. Y. World, who was one of those who examined the yield of our Chester and Blount Corn, writes as follows respecting it in the columns of that journal: "The publication of extra-large yields of corn, especially where the gains have been made in ordinary field culture, is of universal benefit. These announcements not only keep before the farmers the important fact that the average crops of the country are far below possible yields, but stimulate progressive ones to improve their modes and work up to the highest attainable point rather than plod in old beaten tracks. When these large yields are produced in the worn lands of the Eastern States, with fairly good culture and at a comparatively low cost, they assume, of course, additional interest, for the cost of production is a serious question in farm economies.

The statement recently made that more than 150 bushels of shelled Blount Corn to the acre had been grown in field culture with an expense not exceeding $10 per acre for fertilizers, on the experimental farm of the RURAL NEW-YORKER, has set more than one doubting Thomas to thinking, and many enterprising practical men to investigating the matter. A number of the latter, during a visit of inspection to the field where the crop referred to stood in the shocks, made a careful estimate, and from this calculation a yield was shown of 200 odd bushels of corn in the cob to the acre and 140 odd bushels of grain. . . . . This yield illustrates the efficacy of careful selection of seed, preached from time out of date, but too seldom practised. . . . . It is, furthermore, favorable to planting in drills, a mode generally conceded to induce the greatest yields, and its absolutely flat culture. . . . . And last, but by no means least, it proves that excessive yields are not confined to small garden plots receiving special care and expenditure, but are within the reach of every farmer who tills ordinarily good soil, provided he drops into it the best of seed, feeds it judiciously and gives it fair culture.

"PRESERVED MEATS are poisonous" is a somewhat startling announcement; yet that was the practical summary of Dr. Moore's evidence, says the London Live Stock Journal, given the other day at an inquest. A case of fatal poisoning by American corned-beef was under investigation, and the doctor affirmed his belief that it was due to the absorption by the meat of a portion of the metal of the tin or the solder. Mr. Bernard Dyer suggests a somewhat more soothing explanation, that the meat itself was diseased before it was preserved.

A NEW VINE PEST.—A new vine pest has made its appearance in the Rheinthal, canton St. Gall, say the London papers. The disease is said to resemble in some of its characteristics the potato oidium, but it is much more virulent, the grapes affected by it becoming rapidly putrid. Several vineyards have been completely devastated by the malady, which is believed to be of American origin. *Of course.* If not of American origin, where could it have originated?

LAST year's crop of tobacco in Pennsylvania was the heaviest ever grown there, and amounted to 31,000,000, pounds according to the Telegraph. During the past season it is estimated that 149,000 acres were devoted to the plant in that State, and that the aggregate yield will reach 40,000,000 pounds.

IN A SERIES of seventeen corn crops raised in Saline Co., Missouri, by farmers competing for a Granger premium of $200 for the largest yield, it appears that twelve crops out of the seventeen gave an average yield of over one hundred bushels per acre; and this not for one acre only, but for an area of ten acres in each case. We find the above statement in the Business Farmer.

NEW WHITE GRAPES.—Dr. Hexamer describes Lady Charlotte, in the American Garden, as follows:—"Raised by C. G. Pringle of Charlotte, Vt., from Delaware, fertilized by Iona. Color, light green, becoming amber or golden, with a reddish tinge, in the sun; bunch very large, very broad-shouldered, narrow and pointed below; berry, compact of medium size, globular. Flesh with some pulp, but juicy and very sweet, without the least acidity in the center, or foxiness in its flavor. Vine a rampant grower and great bearer; leaves, healthy very large, bearing much resemblance to those of the Iona. The original vine has stood the Winters of Vermont without protection for the past ten years and has borne annually a large crop of fruit.

TRY IT.—Semi-tropic California, which by the way is a very handsome monthly, says:—"Place a bunch of perfectly sound grapes near your bee-hives, and in a few hours examine them and see if the bees have eaten any; if not, puncture several with a pin and note the effect on the sound grapes and the ones punctured, and then let us know if the bees really eat grapes. We ask for a full test, and reports from grape-growers and bee-keepers."

Everywhere.

RURAL SPECIAL REPORTS.

CANADA, Glenmorris, County Brant, Oct. 24.—Farmers are now busy securing the root crop. A considerable quantity having been raised in this locality, and winter threatening to set in early, farmers will need to be up and doing while it is day, for the winter cometh when no man can pull turnips. Thrashing is getting pretty well through, being done mostly by steam, and the grain is finding its way to market. Wheat is now worth from $1 to $1.05 per bushel, and barley about 60 cents. Wheat seems to be above and barley below an average crop. Corn and oats in general were good. I have not thrashed the Mold's Ennobled Oats yet, but I have a good-sized sheaf. The mangels grew splendidly. I tried a small patch of Blount's Prolific Corn the past season, but I think it grows too high to come into general use. I planted a couple of rows of Early Amber Sugar-Cane alongside of the corn and am well satisfied with the result, having obtained nearly a hundredweight of fine sirup from it, causing much less work than making maple sirup. Having obtained a packet of China Corn from Cole & Brothers, Pella, Iowa, seedsmen, I think it can be raised with profit for a fodder plant. I showed it at our provincial fair as a fodder plant not heretofore cultivated, and obtained the first prize. R. R.

CANADA, Cornwall, Ont., Oct. 20.—I consider the plant and seed distribution alone worth the price of the RURAL. The Golden Ovoid Mangels and the Ennobled Oats are far ahead of anything of the kind raised here. I should have competed for the mangel prize but the season has been very unfavorable for roots of all kinds. W. S. T.

CONN., Columbia, Tolland Co., Oct. 30.—Harvesting is being pushed now. Corn is more than an average and of a good quality. Potatoes are not an average crop, though of good size and quality. Onions are better than for many years. Oats were fair, and are being thrashed; the yield is from 25 to 30 bushels per acre. A few who have ventured to try to grow peach trees in this section have been rewarded with a good crop of excellent fruit, with promises of continued success, which is an encouraging outlook in this direction. There also seems to be a growing desire to enter into the cultivation of small fruits, more especially the strawberry, with good results. The apple crop is large, but cannot be said to be of the first quality; the fruit is large and fair, but is greatly injured by the depredations of the codling moth—Carpocapsa Pomonella—and as a consequence much of the fruit is falling prematurely to the ground. A very noticeable and commendable act of farmers in this section is the cleaning up of roadsides, removing bushes and weeds and leaving the places in good condition. W. H. T.

IOWA, Trenton, Henry Co.—I like the RURAL very much, and will do all I can to get subscribers, but it is up-hill work in my neighborhood. A great many farmers don't appreciate an agricultural paper as they ought to. Wheat was pretty nearly a failure; corn good; late potatoes, short; early potatoes, good. Early Winter wheat looks well. I don't think as much was sowed as last year. My Cuthbert Raspberries, mangels, oats and cow-peas did well; the other seeds were a failure. I think I was too late in planting them. W. L.

KANSAS, MCPHERSON CO., Oct. 23.—The yield of crops in this county has been very moderate—corn, 18 bushels per acre; oats, 11 bushels; potatoes, 35 bushels; of barley and rye there was none to speak of. In Rice, the adjoining county, wheat yielded five bushels per acre; corn, 17; oats, eight; potatoes, 40. Little or no barley or rye was produced there also. Potatoes as a rule are better in that county than in this, as the land there is newer. More farmers mulch potatoes there than here, and in this part of Kansas that is the only way to raise potatoes. The above figures, I think, are as reliable as any that can be got at present, for I have much experience in both counties, being on the dividing line, with a farm in each, and having made it a part of my business to get the exact figures. The young wheat never looked better at this time of the year. C. M.

KANSAS, Parkersville, Morris Co., Oct. 25.—We have been having splendid Fall weather, with rain every few days, until the night of the 15th, when we had a "norther" and ice a quarter of an inch thick. Fall wheat is looking fine. Although it was a dry season, the show of farm products at our fairs was about as good as usual. J. E. R.

N. Y., Dewittville, Chautauqua Co., Oct. 20.—Chautauqua Lake is situated 1,305 feet above the ocean level. My garden is over 200 feet high. Latitude about 42.20. I never have raised any mangels before the Golden Ovoid. Of the seeds you sent me I raised 556 beets—whole weight, 1,921 pounds. I sowed the seed about the middle of May and gathered the crop last week. My cow-peas I sowed in a drill as I would other peas. My drill was less than two rods long. I had two pounds four ounces of ripe seed. They commenced to ripen the first of September and continued to ripen until the first of this month. Of the Cuthbert Raspberry one plant died; the other lived and had 25 good-sized, ripe berries. The plant has made a good stand. The pea vines grew rank and thrifty. I have six kinds that got ripe. Wheat and oats are good crops, but not much wheat is grown here. Corn is very uneven—some very good and a great deal under an average. Potatoes ditto. Buckwheat, a large crop for this county. S. B.

OHIO, Thompson, Geauga Co., Oct. 25.—We have had a dry Summer for some of the crops. Wheat, however, was a very good crop; oats light—95 per cent. of an average crop; corn 80 per cent.; potatoes 95; hay about 90; apples 100; peaches 50; grapes 90, and small fruits a good crop. The rivers and creeks are lower than they have been for a long time. Now we are having some light rains, with sleet and cold. I. G. H.

WIS., East Troy, Wolworth Co., Oct. 25.—Fall work is nearly finished, except husking corn and making cider. Help is very scarce and the work goes on slowly. Corn is the best crop we have ever had, and apples are so plentiful that they are rotting on the ground. Potatoes were a good crop. There is not any clover seed, but a large crop of clover hay. H. A. T.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Soiling, Etc.

C. N. G., Plainfield, N. J., having leased a farm, 150 acres of rather rough land, on which he intends to move next Spring, asks, 1, how best to conduct a soiling system for cows and sheep; 2, will Hungarian Grass sown in April or May be as successful as if it were sown later—in June or July.

ANS.—Soiling either partial or complete may be practiced on any land that can be plowed. It is not profitable on poor land except as a means of improving and enriching it. In your case it should be begun gradually. In beginning in the Spring the most practicable plan would be to put in a few acres of oats as early as possible and follow this with some early kinds of corn. These crops should be put in, in succession, one acre a week so that they may come into use as they may be wanted. Hungarian Grass requires hot weather to grow vigorously or it makes a very poor growth. It should not be sown until late in June. It will make as much growth in six weeks of hot weather as in 12 weeks of cool weather. It comes in very usefully as a second crop to be sown on the ground from which the oats and earliest corn are taken. In soiling for sheep the crops are not cut but are fed from the ground by folding the sheep inside portable fences.

Crossing Corn.

E. F., Providence, R. I., having grown Sturtevant's Waushakum Corn for three years, asks whether it would be well to cross it with any other sort—Compton's, for instance.

ANS.—We are not familiar with the Waushakum Corn, never having raised it. But it would be merely guesswork for us to express an opinion. The parents of corn must be selected the same as the parents of animals, viz: with a view to blending good qualities, all of which may not exist in either parent. We may say to our friend that crossing corn and obtaining a distinct new variety is a process that requires years to accomplish. We are surprised to find that many suppose this can be accomplished in a single season, and that the crossed kernel will the next season reproduce itself. We have been working for four or five years with a cross between Stowell's Evergreen and Black Mexican and the new variety is not yet "fixed" by any means.

Killing Borers.

G. H., Bossardsville, Pa., asks whether hot water will kill the borers in trees?

ANS.—No; hot water cannot reach the borers. They must either be prevented from entering the tree or else picked out after they have entered. Wash the trunk in early Spring with lime, tobacco water, soft-soap, sulphur, aloes, etc. Such washes may generally be depended upon to prevent the female from depositing her eggs. The grub upon entering makes a very small hole, though its depredations after entering the tree may extend in all directions. A wire is sometimes used to punch the grub to death, though this is not always effectual. The perfect insect upon emerging bores a round hole many times larger than the hole bored by the grub in entering, which is scarcely larger than the head of a pin. The large round hole is therefore evidence that the insect has escaped.

Miscellaneous.

G. H., Ovid., N. Y., asks the meanings of some words he came across in reading some English agricultural papers, and which have no place in his dictionary.

ANS.—*Byre*—a stable.

Stedding—farm buildings, also with hay and straw stacks surrounding them.

Down Calving—a cow just ready to calve.

Quay or *Quey*—a heifer before calving.

Sterk, Stirk, Sturk—a yearling steer.

Gimmer—a sheep one to two years old.

Hog, Hogget—a yearling sheep before being shorn.

Teg, Gelt, Yelt—a wether sheep.

I. S., Starke, Fla., asks where and at what price can Nova Scotia land plaster be obtained.

ANS.—Nova Scotia plaster must be procured from New York where it is imported. It may be procured in barrels finely ground from any of the dealers in fertilizers for one dollar per barrel. It is usual for the local plaster mills to procure a supply of the rock in bulk from New York and grind it for sale; but the fertilizer manufacturers grind it very fine and as its effect is in proportion to its fineness it is better to get that which is ground for special use by the manufacturers.

L. G. M. S., New York City, sends specimens of a Winter crab apple, a seedling of the Red Siberian Crab, and asks our opinion of them, and whether there are any other Winter crabs that equal them in size and quality.

ANS.—Those received are very handsome, varying from one to one and a half inch in diameter. They are richly colored and we should judge of good quality when ripe. We have seen specimens of Hyslop, Meader's Winter and Lady Elgin as large and handsome, but as to the average merits of the various sorts, as compared with this, we cannot, of course, say anything.

R. B., New Philadelphia, Texas, says he would like to obtain some of the Blount Corn and Beauty of Hebron Potato for seed.

ANS.—Both of these have already been offered by seedsmen. See previous numbers and notices of catalogues. The RURAL never sells seeds or plants under any circumstances. It is our desire to create a demand for excellent varieties. The seedsmen and florists do the rest.

A. B. S., Waco, Texas, sends leaf and fruit of vine, and asks its name.

ANS.—This is called "Dish-rag" Sponge Cucumber, etc. The botanical name is Cucumis acutangulus. The fruit is sometimes eaten when very young the same as cucumbers. When ripe it becomes very tough and spongy and is often used as a sponge.

R. M. L. Oak Burn, N. Y., asks how to treat his Cuthbert Raspberries during the Winter—should they have any protection?

ANS.—We would advise a light covering three inches deep of straw or long manure upon the ground about the stems and extending three feet away from them. We do not suppose they will *require* any protection.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, NOV. 13, 1880.

NOTICE.

FROM some obscurity in our clubbing announcements, many of our readers are applying to us for specimens of the journals with which we club. We beg to state that all applications should be made to the journals of which specimen copies are desired, which will be promptly furnished to our subscribers without charge. Address, therefore, by postal card or by letter :—The Weekly Inter-Ocean, Chicago, Ills.; The Weekly Detroit Free Press, Detroit, Mich. ; The Weekly Globe-Democrat, St. Louis, Mo. ; The Weekly Pioneer-Press, St. Paul, Minn. ; The Weekly World, 35 Park Row, N. Y. ; The Weekly Evening Post, corner Broadway and Fulton Sts., N. Y.

Subscriptions for the RURAL NEW-YORKER and any one or more of the above will be attended to without delay.

ANNOUNCEMENT.

SINCE the past Spring and Summer were seasons of almost unprecedented drought in some places, it is probable many of the Cuthbert Raspberry plants sent out by the RURAL NEW-YORKER failed. In case of such failures we will send other plants upon receiving the address of the applicant and a two-cent stamp for postage. All applications must be made to John T. Lovett, Little Silver, Monmouth Co., New Jersey, and the applications must be CONFINED to those whose names are upon our lists as having applied for our Plant and Seed Distribution of 1879–80.

REMEMBER, RURAL friends, the first of our next series of special numbers will be the CORN NUMBER, to be issued about Jan. 1st. If you have any good facts, oblige us with them, even if they may be stated in a line.

A KIND word for the RURAL NEW-YORKER from our subscribers to their friends at this time would prove more effective than if spoken later in the season, when many will have settled upon their journals for another year. Speak it, friends of the RURAL, if you can! You will find that during 1881 we shall not disappoint any reasonable expectations.

WE wish some (*all*, for that matter) of our readers would try this experiment: Plow a *part* of any field *now*, intended for corn or oats. Then plow the entire field in the Spring. Observe which bears the better grain, that plowed both in the Fall and Spring or that plowed only in the Spring. Most farmers will have an opinion as to what would be the result. But *few* farmers have tried the experiment as we have suggested—so that the *difference* may be seen and, at harvest, measured.

WE would suggest to those who have no woodlands that, as a measure of economy, it is well to plant cuttings or roots of fast-growing trees like the Weeping Willow, Catalpa and Silver Maple. These planted in corners of fields or out-of-the-way places soon make large trees and may then be cut down, without being missed, and used for fire-wood. The Weeping Willow, for instance, in six years from a cutting will make a tree 18 inches in diameter and 30 feet in hight.

TO THOSE having gardens, we would say, spade up the soil now. Turn it over and leave it so until Mid-winter for the action of the frost. Usually in February a thaw accurs. Then it may be worked down and a new surface presented to the air and for the frost to work upon. We cannot estimate the benefits too highly of thus opening our soils to the influence of the wintry elements. Spade deep and thus bring to the surface the hard under stratum that may have lain hard and almost inaccessible to roots for years. Thus the soil will be lightened for another season. It will have become richer through the ammonia and carbonic acid imbibed from the atmosphere. It will resist drought better because it receives more moisture during rainfalls and can the more readily return it to the surface during periods of dryness.

DRYING POTATOES so as to preserve them even for several years in any climate, is a new industry that has sprung up in California. The tubers, which are dried and pressed by a newly devised machine, are said to retain to a great extent their natural taste and original freshness. The first shipment made by a San Francisco merchant to Liverpool brought $160 per ton over all expenses of shipment. Only about 20 tons were exported last year, but these sold at the rate of three dollars per sack for green potatoes, and the demand has become much greater than the supply. California capitalists are reported to be turning their attention to the matter, and several companies are being organized to push the industry. If the process proves as satisfactory as at present claimed, it opens a fine prospect to the farmers not only of the Pacific Slope, but of the rest of the country also.

WOOL.—What Chicago as the center of the packing business, is to the hog trade of the country, Boston as the center of manufacturing business, is to its wool trade—the prices in both places powerfully influence those for the respective products throughout the remainder of the land. For some months wool sales in the "Hub" have been slow, as sellers held their wool firmly for high prices, which manufacturers refused to give unless their requirements forced them to do so. Throughout the country, too, farmers have been keeping their wool back more than usual, a prudent precaution, as we suggested several months ago. Stocks in the hands of manufacturers are now nearly exhausted, and for the last couple of weeks they have been buying freely even at an advance on the figures they formerly declined to pay. Hitherto the mills have gone abroad for a good deal of their supply, but this year most of them have used the domestic clip exclusively, and there is no doubt but every pound of it, coarse and fine, can be sold at prices satisfactory to the producers.

WHERE ENGLAND GETS BREAD.

SOME English statistics just received show the amount of wheat and flour, reduced to a wheat standard, imported into the United Kingdom during the year ending August 31st. From these figures it appears that from the following countries the quantities opposite the names were imported :—

United States	89,359,969	bushels.
Canada	10,130,388	"
Russia	8,998,748	"
Germany	6,867,361	"
Australia	5,410,285	"
British India	4,640,783	"
Egypt	4,270,832	"
Chili	3,343,982	"
France	696,207	"
All other countries	4,960,369	"
Total imports	188,678,924	"

Of the wheat imported from Canada 7,250,000 bushels merely passed through the Dominion from the United States, making the aggregate importations from this country 96,609,969 bushels, while those from Canada dwindle down to 2,250,000 bushels. Thus it will be seen that the United Kingdom obtained from this country about 70 per cent. of the wheat it needed, while British India and Australia give only about seven and one-fifth per cent., and Russia only about six and a half per cent., about two-thirds of which came from the Black Sea ports. The supply from either of these quarters this year will be trifling. All exports of cereals have stopped from the Baltic ports, into which large shipments have been made, 18,000 centals having been sent thither from Liverpool alone during the week ending October 22. The wheat exports from all parts of Russia to England since the opening of navigation in March to October 20, last, amounted to only 891,800 bushels, against 21,582,292 in the corresponding period in '7-.

In this connection it may be interesting to learn that, according to our Bureau of Statistics, the exports of breadstuffs from all ports in this country to all foreign countries, from September 1st, '79, to August 31st, '80, were 156,736,326 bushels of wheat and 6,609,416 barrels of flour, equal to 29,742,372 bushels of wheat, making our total exports of wheat for the twelve months, 186,478,698 bushels. Deducting from this aggregate the amount imported into the United Kingdom, there are left for the rest of the world 89,868,729 bushels, or a little less than half our total exports of wheat.

THE OUTLOOK FOR THE HOG CROP.

THE eight months known as the Summer pork-packing season ended on October 31, the aggregate number of hogs packed in the West, according to the most trustworthy calculations and estimates, having been about 5,240,000, against 4,050,000 in the corresponding period last year—an increase of 1,190,000 hogs, although for the twelve months the increase was only 660,000. The receipts of hogs at the seaboard during the same period were 1,955,000, against 2,015,000 in '79—a decrease of 60,000, so that the aggregate of Western packing and seaboard receipts for the eight months was about 7,195,000 hogs, against 6,065,000 last year—an increase of 1,130,000, or 18⅝ per cent. With the Summer pork-packing season the great Chicago "corner" in mess pork, whose history is given elsewhere in this issue, also came to an end, and henceforth, until the formation of another "deal," the various articles of pork will bear a proportionate value—the price of mess pork having lately been forced disproportionately high in comparison with prices of other kinds—and the pork market, released from the control of one party, will move on in its regular course. It is therefore a fitting time to consider what this is likely to be.

The enormous transactions in pork at Chicago and elsewhere in course of the "deal," afford, of course, no indication of the amount of the article that actually passed from seller to buyer, for most of such transactions were settled by the payment of the difference between the price at which the sale was made in advance and that at the date when the product had to be delivered. As a matter of fact, the amount of pork on hand in the country now is somewhat less than at this time last year, so that it is estimated that it would require an increase of 10 per cent. of hogs to make the present crop equal to that of '79. With the growth of population of the world and its advance in material comfort, the consumption of hog products yearly increases from five to ten per cent. Consumption, too, is largely dependent upon the prosperity of the people, and this year our own population, who, of course, are the largest consumers of our hog products, were never better off; while our chief foreign customers, the lower and middle classes of Great Britain, are also considerably more prosperous than they have been for the last few years. This is partly due to the improvement in the agricultural outlook; for, besides the gain to the farmers themselves from this improvement, their increased prosperity, by enabling them to make larger purchases, imparts briskness to manufacture and trade, thus bettering the condition of the millions dependent on these industries. But the British prosperity is largely a reflex of our own, for we are this year importing an unusually large amount of goods from the Mother Country, thus giving profitable employment to her packed millions and enabling them to purchase more of our agricultural products, and among these not the least important are our hog products.

In view, therefore, of the curtailment of our hog crop by hog cholera and other diseases, as well as of the moderate supply on hand and the probable increased demand, it seems not at all unlikely that hogs will be "firm" this year. Local causes may here and there depress prices, and so now and then may an unusually large supply at the chief hog markets; but, as a rule, the price of hogs this year should be satisfactory to farmers.

BREVITIES.

RIGHT once more—didn't we prophesy the country would be "saved"?

ATTENTION is called to the remarks of C. E. Thorne, of the Ohio State University upon Silver Chaff Wheat.

THE profits of the mammoth Chicago pork "deal" are variously estimated from two and a quarter million to seven million dollars.

WE are very glad to see that Walter A. Wood, one of the staunchest friends of agriculture in the United States, has been elected to Congress.

UNUSUALLY large shipments of wheat are being made from here to Marseilles and other Mediterranean ports hitherto supplied chiefly from southern Russia.

WE have been spreading stable manure over our grape-vine borders. This is a good plan. It is a protection to the roots and the juices soak down ready for use next Spring. We have a mind to add a sprinkling of ground bone and unleached ashes.

FROM August 1 to September 30 the amount of wheat and flour, calculated as wheat, imported into France, aggregated 14,619,760 bushels, against 11,769,120 bushels for the corresponding time last year—or an excess this year over last of 2,850,640 bushels. Since the end of September, however, shipments have been falling off slightly.

NOW that the election is over, we presume all good farmers—whatever interest they may have taken in it during the latter part of the contest—will give themselves up to promoting the interests of the farm. Here is enough to engage our best thoughts—our unremitting labor. The outlook for farmers has never been more encouraging in the history of this country. But let us not rest upon our oars. Let us work hardest while it pays best, and then in the dismal times of the future, which are sure to come sooner or later, we may enjoy the results of having provided for a rainy day.

UNTIL last Fall Canadians found a market for their surplus rye in the United States alone, no attempt having been made to export it to Europe. In the Autumn of '79, however, an enterprising merchant of Montreal, in spite of much discouragement from his neighbors and from lack of facilities for procuring bills of exchange, sent a pioneer cargo of 60,000 to 70,000 bushels to Antwerp, and found the venture profitable. Since then the trade has largely increased, exports having been made to London, Liverpool, Antwerp, Havre, Hamburg, Bordeaux and Marseilles.

THE Burning Bush (Euonymus atropurpureus) is not a very handsome shrub, either for its foliage or flowers. But its berries, now that leaves are falling and the garden begins to look dreary, are bright and beautiful. The capsule, or outer covering which is of a crimson color breaks open like the burr of a chestnut revealing the orange aril of the seed within. These arranged into bouquets with other Autumn fruits or berries as, for instance, the Bitter-sweet (yellow), Black Alder (red), and Callicarpa purpurea (purple), interspersed with sprays of Autumn leaves, make very pretty ornaments for the mantel or table.

WE continue our beautiful engravings from nature of the new and promising grapes of the period. Respecting the *quality* of these grapes, it is an easy matter to speak positively. But as to how they will thrive in different parts of the country readers must bear in mind we have nothing to say. That can be ascertained *only* by tests, and several years are required to make them. We speak positively of such new fruits only as have been tested in our Experiment Grounds, and even then our reports are to be taken as but *one* bit of evidence *pro* or *con*, for that which falls or thrives with us may not thrive or fail in other soils and climates.

STATISTICS of the fruit trade, owing to the perishable nature of the products and the rapidity with which they are distributed, are difficult to collect, and the Census Bureau calls upon fruit dealers to facilitate the work by making returns of the quantities and values of the different kinds of fruit handled during their last complete trade year. Such returns will be considered strictly confidential and used only in making up the grand aggregate of city and town trade. Owing to the importance of the national work now in course of preparation, it is hoped that dealers will be careful and prompt in conveying accurate information, although it may cost them considerable trouble.

THE good prices American apples brought in the English markets a short time back are reported to have caused the shipment of fruit very carelessly selected, while a great deal of the exported Winter apples have been picked too early. This is said to be especially the case with Baldwins and Greenings, with the latter of which the English market seems to be overstocked. Both to keep up prices and to insure a favorable market in future by the good quality and fine appearance of our present shipments, too much care cannot be taken in selecting good specimens alone for export. The advantages of careful selection in the home markets are constantly noticeable, and ocean freight should be paid on nothing except choice fruit especially adapted to the taste of our foreign markets. In England small, handsome apples are preferred to large specimens by the better class of buyers.

OUR readers are fully aware that for this climate we prefer Spring to Fall for transplanting fruit and, in fact, ornamental trees and shrubs generally. We have also condemned the practice so often advocated, of heaping up the earth about the stem "as a support" etc., for the tree. We find in the Nebraska Farmer that our contributor Ex-Governor R. W. Furnas says that his twenty-five years' experience in Nebraska are strongly against Fall planting of trees; that he has witnessed twenty failures to one success. If attempted, however, he says it will be worth while to observe the following precautions: "Plant early and cover the roots deeper with soil or mulch than intended to remain during the growing season. In putting on this additional covering, be careful not to heap it up against the body of the tree. If soil is placed against the body of the tree, freezing, to any extent, injures the bark. If mulch, it affords a hiding place for mice." His future planting—and he expects to keep at it so long as life lasts—will all be done in the Spring.

DURING the past month 30,647 immigrants landed at this port—a larger number than during the corresponding month of any previous year. Among the various nationalities the Germans were considerably the most numerous, and they were mostly small farmers driven from home by light crops, heavy taxes and the odious burthen of compulsory military service. A large proportion of the new-comers are bound for the West, and these are the most desirable class, for, as a rule, they have more capital, intelligence and character than those whose lack of means forces them to over-crowd still more the labor market in our Eastern cities. Apart from whatever sums of money these additions to our population may bring with them, their presence among us adds greatly to the nation's wealth. The worth to the country of a man's labor has been put at $1,000; that is, beyond supporting himself, he should add that amount in one way or another to the national wealth. On this basis it has been estimated that such a flood of immigrants as are now flocking to this country must add the enormous sum of about $500,000,000 per annum to its wealth. This may be a trifle high; but the Bureau of Statistics estimates that the immigration to our shores from '65 to '75, when it was much less than now, added every year to our wealth an aggregate of $125,000,000.

Literary Miscellany.

THE OLD OAK TREE.

I LOVE the woods arrayed in Summer green,
Or tinged with russet Autumn's golden sheen;
In pensive mood I gladly seek their shade,
And ramble through each leafy glen and glade
But yet, howe'er the forest may delight,
The opening plain brings still a welcome sight
No dearer spot the landscape holds for me
Than that white-gowned, spacious grassy lea
Where stands in solitude the old oak tree!

In by gone days, how often here I've strayed,
And lovingly thy giant form surveyed;
Returning now from lands, I long have ranged,
I come in age and find thee all unchanged.
'Tis truly writ that life is but a span,
At least that portion which belongs to man;
For but as yesterday it seems to be
When, still a boy, I cut my name with glee
Deep in thy rugged bark, dear old oak tree!

In rising manhood three staunch friends were wont
From time to time to seek this cherished haunt;
Each took his chosen path the world to roam,
With hopes to meet in after days at home.
Alas! ere many years had fleeted o'er,
One sank to rest on far Arabia's shore;
The next found sailor grave in tropic sea;
While I am left alone of all the three
To keep the tryst beside the old oak tree!

How still the air around this regal oak
Ere yet my voice the charmed silence broke;
Till now unheard the drowsy feathered throng
Awake to pipe with joy their evening song;
The daisy closes with a glance of love;
The dark'ning shades surround the mystic grove.
Oh! when the Fates send forth their dread decree,
That bids the day no longer break for me,
May sunset find me 'neath the old oak tree!

—Chamber's Journal.

INMATES OF LESTER HALL.

(Continued from page 741.)

"That is all right. Now look here, little woman; I am in a difficulty. You know I want Carewe to be my best man. I don't know how I shall support myself on such a trying occasion without his assistance."

"He does not refuse you, does he?" said Mattie, anxiously.

"No; but I am afraid it will be awkward about Cecil."

"About Cecil? How do you mean?" asked Mattie, in some surprise; for at Lawrence Carewo's request Mr. Edgar had kept the fact of his rejection from her knowledge.

"Well, you see, dear, Lawrence was awfully in love with her," stammered Mr. Edgar, rather confusedly, "and she did not behave well; she led him on, and then threw him overboard as coolly as possible!"

"Oh, Edgar!"

"It is quite true, love. You yourself thought she cared about him, but it was only a flirtation after all. Still, do you think Cecil will object to his being my best man?"

"I don't see how she can, if he does not object to meeting her," said Mattie. "But, Edgar, are you sure he told you he cared for her?"

"Yes, quite sure; it was one night that he was dining here, do you remember? He and Cecil were together in the conservatory for some time. When I went in," Mr. Edgar continued, "Lawrence was alone, and I never saw a fellow so cut up in my life. He did not tell me what had passed between them but I gathered that she had refused him. I was furious, for I had every hope that he would have been successful, but he would not let me blame her. 'I love her' was all he said. I wish she could have heard him."

"How wrong of Cecil," faltered Mattie.

"Wrong! it was cruel; for she had certainly encouraged him," said Mr. Edgar, indignantly. "I can't help feeling angry with her, Mattie. Lawrence is too good a fellow to trifle with."

"Did he feel it so much?" said Mattie, regretfully.

"Feel it! It almost killed him," said Mr. Edgar, bitterly. "She had raised his hopes so high."

"I thought she cared for him," said Mattie, in a low voice.

"No man could resist her if she behaved to him as she behaved to Carewe," said Mr. Edgar, decidedly. "It was unpardonable, Mattie."

"It is incomprehensible, Edgar," she answered. "Do you know that once I spoke to her about it: I asked her if she cared for him, and something in her manner that day seemed to me to say that she loved him almost unwillingly as it were."

"If she loved him, she betrayed him," said Mr. Edgar. "Will you find out, if she will condescend to walk in and out of church with him?"

That evening, just before dinner, Mattie went into her sister's room and found her alone. She was standing by the toilet-table, dressed for dinner, looking pale; and as she lifted her eyes on Mattie's entrance, Miss Lester almost started at the expression of hopeless misery in their depths.

"Cecil, dear, what is the matter?" she said, impulsively; but Cecil gently loosed herself from the tender hands.

"There is nothing the matter," she said, petulantly. "What should be the matter, Mattie?"

"Nothing, I hope, dear," said Mattie, gently. "I want to ask you something, Cecil."

"Well, I am listening," she answered, ungraciously.

"Have you any objection to Dr. Carewe being Edgar's best man?" said Mattie. "You know it is a bridesmaid's privilege to choose—or it ought to be, if it is not."

"Objection?" said Cecil, slowly. "No, I have no objection. Why should I have?"

"That is satisfactory," said Mattie, as she turned away; but Cecil put out her hand and caught her dress.

"Wait a minute, Mattie," she said, calmly. "I too, have something to tell you. Prepare to offer me your congratulations."

"Congratulations!" and Mattie turned quickly. "Oh! Cecil, is it Dr. Carewe?"

Cecil looked at her with some haughtiness and surprise in her lustrous eyes.

"That would hardly be a matter of congratulation," she said, disdainfully. "I was going to tell you of my engagement to Mr. Eleston."

"Mr. Eleston!" repeated Mattie.

"Yes," said Cecil, calmly.

"But, Cecil, you refused him!"

"Possibly; but I have changed my mind—that is a woman's privilege, you know," she answered, still with the same proud composure of manner. "Well," she continued, after a moment's pause, "do you not wish me all happiness, Mattie?"

"My darling, yes!" said Mattie, warmly, as she kissed her. "But, oh! Cecil, are you sure that you love him?"

"Is that necessary?" Cecil asked, with a slight half-ironic laugh.

"I think so," Mattie said, gravely.

"So we differ," answered Cecil, smiling, "Hark, is not that the dinner-bell, Mattie?"

They left the room together; but as they went down stairs Cecil paused a moment.

"Uncle Henry has given his consent," she said, steadily. "Mr. Eleston spoke to him to-day. He is very glad. You will not try to make him dissatisfied, Mattie? Believe me, I love him quite well enough to make him a good wife."

"I was not thinking of him but of you Cecil," said Mattie, gently. "It is not for me to interfere, you know, since you wish it."

CHAPTER XVII.

IN BRIGHTON.

THE engagement between Cecil Lester and Mr. Eleston took the great world in which they moved by surprise, for although the devotion of the young man had been very evident, Cecil had always seemed to discourage his attentions, and treated him with a half-kindly, half-indifferent gentleness, which was less promising than coldness or disdain would have been.

However, his patient devotion had won its reward at last, for Cecil had accepted him; Mr. Daton had given his consent; a diamond engagement-ring glittered on the little white finger. He was raised to the seventh heaven, and there was not a happier man in Brighton, whither he had accompanied Mr. Daton and his niece after the wedding of Mattie and Mr. Edgar and their departure for France.

He was a good-looking young fellow, slender and fair, with curly, golden hair, frank, smiling blue eyes, and a hearty, cheery manner, which impressed people favorably. He was very young—only two or three years older than Cecil herself—and his pride and delight in his beautiful *fiancee* were pleasant to see, and won her uncle's heart. He made a very pleasant addition to the Brighton party, Mr. Daton thought, and prevented Cecil from moping after her sister, which she was rather inclined to do, he said to himself, remembering the white face, so still and stony, which he had seen as she passed down the aisle on Dr. Carewe's arm.

Five or six weeks passed quietly and pleasantly enough. Mr. Daton went up to town occasionally; long, pleasant, chatty letters came from Mattie and her husband, from various places in France and Italy, where they were evidently enjoying themselves to the uttermost. Cecil rode, drove and danced with almost feverish energy; Mr. Eleston lived in a bright day-dream of happiness; and Mrs. Audley worked wonderful designs with her crewel silks and worsted, and went on the even tenor of her way.

One bright frosty morning early in December Cecil found herself the first down to breakfast and for some minutes the only occupant of the dining-room. She crossed over to the window, and stood for a moment looking out on the Parade at the sea, lying so calmly, deeply, beautifully blue, stretched out before her, more than one passer-by turned to have a second look at the beautiful weary face, and the wistful, yearning eyes.

In a few moments the butler entered with the urn, and Cecil went over to the table to make the tea; and she had just completed her task, when Mrs. Audley's maid came in with a message from that lady to the effect that she had a bad headache, and begged to be excused appearing at breakfast. As the maid left the room she encountered the butler, who was bringing in the letters, some of which he deposited at Mr. Daton's place, and two or three of which he presented to Miss Lester.

Cecil took them negligently; the one which lay on the top was addressed to her in the bold, dashing caligraphy of her *fiance*, who was absent for a few days—the others were notes of invitation probably; Cecil threw all three aside a trifle indifferently, with a slight expression of annoyance.

"Not one from Mattie; I fully expected one from her this morning. Good morning, Uncle Henry; is it not cold? Go to the window and see how dreary the Parade looks. I begin to wish Ernest would come back. I quite miss him."

"Do you, my darling? So much the better. Where is Mrs. Audley?" asked Mr. Daton, as having returned Cecil's affectionate greeting, he went to the table, and taking up his letters, glanced at their superscriptions.

"She is not well—she has a headache," said Cecil, taking her seat behind the urn. "Will you have tea or coffee, Uncle Henry?"

"Tea, if you please, my child, he replied, rather abruptly. "Ah here is a letter from Mattie."

"From Mattie?" echoed Cecil. "I am so glad! I expected to hear from her this morning, and not receiving a letter, I fancied she might be ill. What does she say?"

"It is a long letter, Queen Cecil," said her uncle, smiling. "I think it must wait until after breakfast. This speaks well for her health."

So saying, he held up some closely-written sheets of foreign paper.

Cecil laughed.

"What a lengthy epistle! Poor dear uncle! You shall read it out loud to me after breakfast as a great treat."

"The queen commands, and I obey," he answered, with a comical resignation. "The fact is, Cecil, Ernest has completely spoiled you—you are getting quite unbearable. Poor fellow, I quite pity him!"

A sudden shade swept over the beautiful face.

"Poor Ernest!" she said, softly, and said no more until breakfast was over, when she left her seat, sat down in a large arm-chair before the fire, crossed her dainty little feet on the fender-stool and her hands on her lap, and said, coolly:

"Now, Uncle Henry, please."—To be continued.

THOMAS HUGHES: HIS "TALK TO STUDENTS."

MANY a reader of the RURAL, I am sure, have read "School Days at Rugby" and "Tom Brown at Oxford," and will be glad to hear something about their author, the famous Englishman, Thomas Hughes, who is now in this country founding a colony in Tennessee, lecturing, visiting and becoming Americanized generally.

Mr. Hughes will probably never get over being a schoolboy, in a way, for in meeting with students he lives over his own school life. The way I happened to see and hear him and take him by the hand, came about, was because he came to talk to the students of Haverford College (about nine miles out of Philadelphia) about his own school life at Rugby, and of the famous Dr. Arnold, who was head master there at that time. The College faculty, with commendable appreciation, sent out invitations to various persons in the city and the neighborhood to be present at the talk, so there was a goodly company present, and when, at a quarter past four in the afternoon, Mr. Hughes stepped to the desk on the platform of the audience room, there was a lively greeting of cheers. One thinks of Mr. Hughes as "Tom Brown" and endowed with unchanging youthfulness and boyhood; but the reality shows a man of 60 years of age, or thereabouts, tallish, slim, bald-headed, blue-eyed, with a fringe of sandy hair and mutton-chop side-whiskers of the same hue, clear-cut features, showing decided firmness and character, blended with a look of business and benevolence—if you can imagine that. He began to talk in a clear, English voice, with the intonation and accent that is so peculiarly and strikingly English to the ear, but which is difficult to make apparent on paper. His talk was quite informal, and he half leaned on the desk in front of him as he talked, planting one foot and then the other alternately in front of him, as if to make his attitude an easy one, and making one hand, which had a sore finger, the plaything of the other—being handsome hands, too, with long, tapering fingers that looked to be the exact counterparts of the hands of Drs. Elizabeth and Emily Blackwell, his famous countrywomen, who have done such splendid work in this country.

Mr. Hughes said the way he happened to be sent to Rugby was from the fact that his father had been a fellow pupil at Oxford with Dr. Arnold, and Mr. Hughes was so impressed with the superiority of Arnold as a young man that when he became head master of the school at Rugby he at once decided to send his two boys to him, one of whom was the now famous "Tom" Hughes.

But "Tom" had been at Rugby about three years before Dr. Arnold recognized anything of particular interest in him, and the way it chanced was this:—Dr. Arnold was a great reader of Scott's novels (derided nearly all others), and encouraged his "boys" to read Scott. He often alluded to passages in them which illustrated passages in the Latin authors the boys were reading. Upon this occasion they were reading "Horace," and Dr. Scott asked for an illustration of the passage from Scott. "He began at the head of the class," said Mr. Hughes, "and came down, down, down—I was always well toward the foot—until he came to me and I could give him the quotation. He seemed greatly pleased, and told me to go to the head of the class, where I went; but, as usual, I did not stay there long." [Laughter.]

After that the Doctor depended upon "Tom" to give the illustrations from Scott, when all the rest of the class failed. But upon one occasion, when Baron Bunsen, the famous scholar, had been brought in as a visitor by the Doctor, all the class failed, even young Hughes, who was "dreadfully ashamed."

The Doctor, when he had famous men visiting him, was in the habit of bringing them into the class, so that the boys could have a chance to see them. One of these visitors was Archbishop Whateley (author of Whateley's Logic, etc., etc.), and when he preached he made a great impression on the boys, because he would stop almost in the middle of one of his strongest sentences and, diving his hand in his waistcoat pocket, would bring out a huge pinch of snuff, for, although a snuff-taker, he always carried the stuff in his waistcoat pocket instead of in a box.

He related another anecdote of Whateley which was even worse. The boys—some of them, of whom "Tom" was one—had been invited to dine with Dr. and Mrs. Arnold in honor of the Archbishop. The table was covered with a beautiful, fine, snowy cloth, and spread with shining glass and china and silver, and the boys were ranged around waiting for the entrance of Dr. Whateley. Suddenly he rushed into the room, with his hands full of a mass of grass and dirt, and a curious worm that he had never seen before, and which he had found in his walk, and full of talk about it he deposited the mass on the faultless table-cloth with perfect unconcern, as though he had not committed a most boorish and uncivilized act. Imagine Mrs. Arnold's disgust, and think of such an example by a really great man in the presence of young men whose habits were being formed!

Mr. Hughes described Dr. Arnold as being a tall, loose-jointed man, with a shambling, ungainly walk, as our lamented Lincoln had, with bushy hair, piercing eyes, and a strong, heavy under-jaw that was a sort of barometer of the man. By the working of that under-jaw the boys could always tell when any one of them was making a poor recitation or otherwise appearing meanly in the eyes of the Doctor, as it would take on, to them, a terrible form, swelling with the feelings within.

The appointment of Dr. Arnold as head master was at the outset quite extraordinary, as he was what the English call a "Radical," and he really reformed the high school system throughout England.

At that time only about 2,000 English boys from the higher classes were being educated annually, in England, while now the boys receiving a higher education, number 20,000. At Rugby, Dr. Arnold revolutionized the school, making himself the target for abuse all over England. Among the various high-handed things the boys had, were packs of hounds, and they made themselves the terror of the neighborhood.

Dr. Arnold discharged the hounds and at one time expelled a party of boys, which at that time was unheard of, and brought wrathfulness down upon his head from all quarters. But he said it did not matter whether there were 300, or 200, or two boys at Rugby; but it *did* matter that the number there should be gentlemen. He pulled affairs out of old grooves, attacked old prejudices; in a word, was a reorganizer. Old friends fell away from him; he was hurt because of the misapprehension of his motives, but he kept on in the strong, frank, open-hearted, brave way in which he started, and gradually friends rallied about him, the boys were devoted to him, his books and speeches aroused England, and soon gained an immense influence. He seemed to respect nothing because it was old, but only because it was right. One great point he made with the boys was that they should never separate secular from religious work. He would have them believe all days to be holy and to be as conscientious in all their week-day work as in their religious devotions on the Sabbath. And such an industrious man! Mr. Hughes recalled the times when he and another boy, would climb out on a certain roof where they could look down into the Doctor's study, where late at night, after a hard day's work, they would see him absorbed in writing the books that afterward made him so famous.

It was a common saying in England that with Dr. Arnold, every question was an open question every morning when he got up. And his great power lay in his freedom from bigotry, the broadness, liberality, justness and bravery of his views.

He had the courage of his own opinions, and in his opinion, all classes of society, Quakers, Methodists and Presbyterians had as much right to higher education as the communicants of the State Church—the Episcopalians. So it came about that schools multiplied, and the doors to a liberal education were opened to all. It seems perhaps a small thing to us, but it was a great innovation in England.

It is always a pleasant thing to hear a pupil lauding his master, and it certainly was a treat to hear Mr. Hughes tell why it was that the Head Master at Rugby was so beloved and so great.

In his pronunciation Mr. Hughes, in one respect, is open to criticism. He rarely if ever sounds the "g" in syllables ending in "ing." He would say "exceedin'ly," "straggliu'," "governin'," "leav in'," etc. He pronounces "been" as most English people do, "bean"—and which, according to Richard Grant White, is the correct way. After he had concluded his talk of an hour and a half, the college conferred upon him the degree of Doctor of Laws. The degree was conferred upon him in Latin and he responded in that tongue, although quite surprised at the honor extended him, showing that at least some of the Latin that he learned at Rugby belonged to him yet.

As we were leaving the college we met Mr. George W. Childs, whose guest Mr. Hughes was, in Philadelphia, and with his usual ready tact, he presented us to Mr. Hughes, who shook hands as cordially as if he had not already had his hand nearly shaken off in this much hand-shaking country. He showed a genial, hearty, even jolly manner, as if his heart was as young yet as any school boy's, and it was easy to see that he must be greatly beloved by the people who know him. He says that Dickens went through this country with his eyes shut—otherwise he would never have written about Americans as he did. Mr. Hughes' memory of faces is not so good as Gen Grant's, for example, for when we were introduced he remarked with an expression of gladness, "I thought I remembered your faces," and it was the first time that he had ever seen them! He evidently does not like our protection system, for he said that straw hats cost so much last Summer when he came here, that he couldn't or wouldn't pay the prices asked; but he found that he could buy a new copy of his last book for *three* cents, and bought it. That must have been because of the enterprise of "The American Book Exchange."

MARY WAGER-FISHER.

BRIC-A-BRAC.

"Just look at my thimble," said a young lady to her beau; "it is actually worn out. Don't you think I ought to be rewarded for my industry?" The young man replied that he thought she should be, and the next day he sent her a new cap for her finger with the following lines:

"I send you a thimble for fingers nimble,
Which I hope will fit when you try it;
It will last you long if its half as strong
As the hint which you gave me to buy it."

TO A COMPLAINING SUBSCRIBER:—We are sorry you don't like the paper. We publish it simply to please you. We should ask you to come down to the office and edit it, only that if you did, some idiot might write to tell you how much better he

could do it himself, and that would annoy a nervous person like you. The exchange from which this is taken will get along in the world.

From an Album we extract the following:

Remember me and bear in mind,
A faithful friend is hard to find;
And when you find one that is true,
Stick him fast with Spaulding's glue.

A CHARMING young girl at Bellaire,
Was in trouble about her front hair;
If arranged in a bang
It never would hang
At all straight, but waved wild in the air.
And she heated an iron red hot,
And went in for a frizz on the spot,
She will never look cute,
But by purchasing jute
Is as likely to fool folks as not.

A LADY of amiable disposition was lately instructing a class on duty to the neighbor. At the termination of the lesson, and after an oration on the virtue of returning good for evil, in the belief that she had made a favorable if not a lasting impression on the youthful minds, she wound up with the following question, "Suppose a person were to be unkind to you, or strike you, what would you do?" A pause ensued, when one little girl, sharper than the rest, made the following laconic and not unnatural reply, "'It 'm again."

FIG. 363.

A TALL, elderly, refined-looking gentleman recently went into a small post office in a rural region of England. He asked some question relative to the registering of a letter, and was very sharply, rudely, and unnecessarily snubbed by a young woman in attendance. He asked her if she thought that was a proper way to answer an inquiry in a public office. She said she thought she had been quite civil enough for him. He asked her, with ominously increasing mildness of manner, if she would favor him with her name. She emphatically declined to do so. He then said he thought he would tell her his name, which, however, she declined to hear, saying that his name was no concern of hers. He calmly replied that he thought it was, for his name was John Manners, and he was the Postmaster-General.

LIFE STORY.

Seven years of sport and play,
Seven years of school from day to day,
Seven years of college or apprentice life,
Seven years to choose a wife,
Seven years to pleasure's follies given,
Seven years to business hard driven,
Seven years for some a wild goose chase,
Seven years for wealth a bootless race,
Seven years to hoarding for your heir
Seven years of weakness spent in care.

HERE is a story they are telling just now in London of a troop ship: In the ladies' cabin were four wash-basins, one of which was much larger than the others. There were three ladies in the cabin whose husbands were about equal in rank. The women always think they have a right to presume on the rank of their husbands when taking choice of berths, etc., and there was a great discussion as to who was entitled to the big basin. It was referred to the paymaster of the ship, who could settle nothing, and eventually to the captain. He gave a decision worthy of Solomon. After first asking them if they would abide by his verdict and not give any more trouble in the matter, which they readily agreed to do, he said he thought it was only fair that the oldest lady should have the biggest basin. That basin was never used during the whole voyage out.

ONE of the curious products is the sedate, stiff-rimmed father who does not love to read, and who, keeping his children within doors during the long evenings, tells them to "set and think." To their impatient inquiries, "What shall I do? he invariably replies in a hard, discouraging tone, "Can't you set and think?" The children of that man are likely to become sour, dry, hard and morose. Their minds become air-slaked and lack-in spirit. One evening a little boy who had been sitting for an hour in the presence of his silent father, who had commanded him to "think," said "Father, what are you thinking of?" "The days when I was wild. And, young man, what are you thinking of?" "The days when I shall be wild."

FIG. 364.

RECORDER—You are charged with choking, beating and kicking Parson Bledso, without the slightest provocation. The evidence shows that he addressed you in the most courteous manner, asking after your health, whereupon you fell upon him like a savage. "You dunno Parson Bledso, does yer, boss?" "I do not." "Jedge, no man honahs Parson Bledso moah den I do. He is a puffec gemmen ob de ole school." "What did you break the bridge of his nose and kick him in the abdomen for then?" "Jedge, he is the persuasivest talker you eber heerd. Ef I hadn't hit him in de mouf, in one moah minit he would hab borrowed dat dollar I'se been sabin up to go to de suckus wid, but I has got a better skuse dan dat ar." "What is it?" "You see, Parson Bledso has been proachin' powerful agin chicken stealin', and I has been making an earnest effort to reform. I haint pulled a pullet in two days. Ef I hadn't hit de pasture in de mouf he would hab talked me outen dat ar suckus dollar, and den—" "What then?" "Den, ob course, some white man's chicken coop would hab had to furnish de kerlatcrials to raise anudder suckus dollar. I would hab backslid, suah, and de parson heeself would hab been ter blame foah de defection in de party." "Yes, I see." "So you see do you boss, dat when my pasture ran his mouf agin my knuckles, when I reached out from the shoulder, I was starting a culled reform movement." The recorder took the case under advisement. He said he wanted to look up the authorities.

LEAP YEAR PRIVILEGE.

She took his arm, and as they walked
Adown the lighted street,
'Twas by the merest chance, of course,
They chanced a priest to meet,
"Poor man," said she, "how poor he looks,
How sad, forlorn and drear;
I wish you'd help the Christian man
To twenty dollars, dear."
He took the hint, of course he did,
Then something more was said,
And ere he left her 'twas agreed
That soon they should be wed.
Said she, while swinging on the gate,
"Mind, we're engaged, my dear,"
And thus do girls manipulate
The rights of this leap year.

FIG. 365.

"GOT any matches?" asked Smithkins, stepping into the grocer's. "Well, I hain't got anything else," replies the man of pints and pounds. "You may put me up half a dozen bunches," says Smithkins "I'll be after them presently." By and by he returns. Handing the matches the grocers says sweetly, "Is that all to-day sir?" "Why, no," Smithkins returns; "I did want ten pounds of sugar, and a barrel of flour, and a tub of butter, and a few other things; when I asked you if you had any matches, you said you hadn't anything else, so I bought the other things over to Herringbone's across the way." You can fancy the feelings of the grocer, but they cannot be described. He is very particular how he answers customers ever since that day.—Boston Transcript.

MRS. M——is beautiful, rich, and fashionable but is unable to read. One day, while calling upon her friend, Mrs. B——, she perceived a richly bound copy of the Holy Bible; and smilingly she inquired if she might take it home and read it. Wondering much, Mrs. B—— assented; and one week after the book was returned. "Were you pleased with it?" asked Mrs. B——, dryly. The sweet, blue eyes of Mrs. M—— fairly sparkled with pleasure. "Oh, my dear friend, it is a charming novel. They got married at last."

For Women.

CONDUCTED BY MISS RAY CLARK.

LITTLE VOICES.

When the western sun is sinking,
And the timid stars are blinking,
And the sheep-bells' distant clinking
Tunes the evening air;
Children's voices gaily ringing,
Shouting, laughing, talking, singing,
Ride the balmy breezes, flinging
Music sweet and rare.

When the Winter fires are gleaming,
And the ruddy cheeks are beaming,
And the hollied rooms are teeming
With the radiance bright;
Lordly roof and cottage rafter
Echo back the merry laughter
Of the happy children after
Every new delight.

Richly sweet, and sweetly pleasant,
Ringing out the past and present,
Comes the voice of lord and peasant
Merrily and clear;
We forget awhile the madness
Of our dreaming and our sadness,
And rejoice with them in gladness,
Losing every fear.

'Mid the Summer's fragrant breezes,
When the chill of Winter seizes
Every verdant gem, and freezes
Every pool and stream;
Come the children's voices ringing,
Ever fresh, and ever bringing
Joy to sorrow, sweetly flinging
Over us a dream.

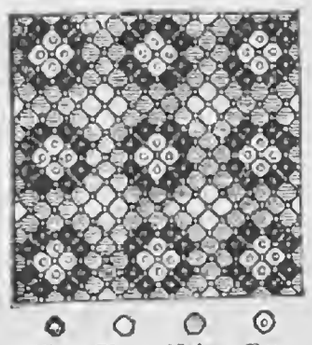
Little merry voices swelling
Round about our childhoods' dwelling,
Frank and fearless, fondly telling
Of the happy yore;
And we bless the children's laughter,
Echoed from the dome and rafter,
And their little voices after
Love them more and more!

W. M. A.

DESCRIPTION OF CUTS.

FIG. 366.—DESIGN IN BERLIN WORK.

Four colors are required for this design, which



Olive Green. Blue. Maize. Rose.
FIG. 366.

may be used for slippers, mats, cushions or footstools. The maize color will look best worked with silk.

FIG. 363.—BONNET.

The bonnet is of dark-green beaver, trimmed with feathers and satin ribbon.

FIGS. 364 AND 365.—WINTER BONNET FOR LITTLE GIRL OF FIVE OR SIX YEARS OF AGE.

The bonnet is of white beaver, with trimmings of blue plush; blue tuft and ribbon to match.

FIGS. 368 AND 369.—PALETOT FOR LITTLE GIRL OF FOUR OR FIVE YEARS OF AGE.

The front is shown in Fig. 368, the back in fig. 369, in different materials. Fig. 368 is of fawn-colored tweed; the bottom of paletot and pelerine are finished by rows of machine stitching; bows of satin ribbon ornament the neck, the opening at the back of paletot and the muff; the collar and bands on muff are of brown seal; the muff is hung round the neck by a brown silk cord. Fig. 369 is of golden beaver-colored velveteen, with trimmings of golden beaver fur.

FIG. 367.—CHILD'S PALETOT, WITH CAPE: TRICOT.

Materials Required: one-half pound of blue and one-half pound gray Berlin fingering, and a tricot-hook.

No difficulty will be found in working this paletot. It is advisable to have a paper pattern cut the exact size required, so that the work may be placed upon it from time to time, in order to keep the increase and decrease in the correct proportion.

Commence with a chain the length required from the neck to the bottom of paletot, work to the pattern in ordinary tricot, either in stripes of

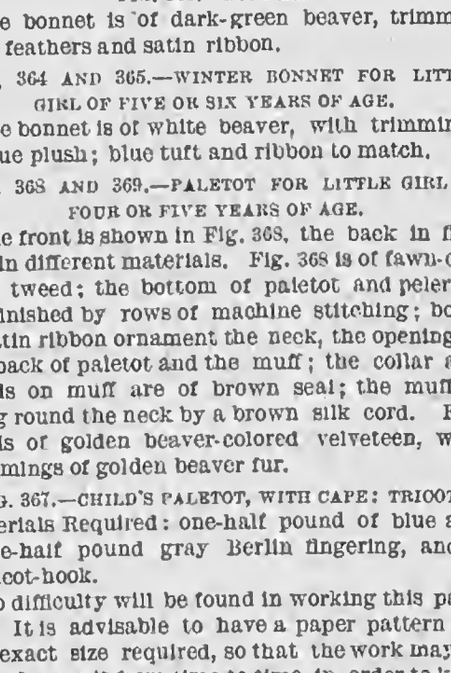


FIG. 367.

four rows of each of two colors or in one color. To increase a stitch, work up two loops through one stitch, then in working off work as two stitches; to decrease, draw through two loops together. As will be seen from the paper pattern, an increase is needed to form the neck, and a gradual slope for the shoulder. Care must be taken to keep the increase and decrease always at the same end, or the bottom of the paletot will be thrown out of shape. The back and the two fronts are worked separately, and must be sewn together under the arm and at the shoulder. The sleeve is worked lengthwise. For the ball fringe, which finishes the bottom of paletot and cape, commence by making the balls.

FIG. 368.

For the heading of fringe, which is also used as a trimming for the front of paletot and sleeves, work loops of double wool over a mesh an inch wide into a piece of narrow braid at each side, thread some balls on a length of wool, and fix to the braid between the two rows of loops by a needle and thread, working the stitches between the balls.

For the fringe, before working the second rows of loops on the braid thread a needle with double wool, draw it through a ball, pass the wool through another ball, leaving about half an inch of wool between the two balls; pass the wool through the braid, leaving a loop of about two inches, fasten with a buttonhole stitch, pass the wool again down through the last ball, and repeat for the length required.

For the second row, thread a needle again with double wool of a different color if preferred, join to the first loop of last row, pass it through a ball, join by a buttonhole stitch to a loop between the two balls of last row; pass the wool again through the ball, make a loop over the same mesh used for the heading to keep the edge even, and repeat. Now work the row of loops on the other side of braid, and sew the balls in the center; the fringe is sewn on by a needle and wool.

The cape is joined to the paletot at the throat by working a row of double stitches through the edge of both; it is tied at the throat by a chain of crochet stitches, with tassels at the ends.

The balls are made as follows: Cut two rounds of cardboard alike, and a little larger than you wish the balls to be; cut in the center a circular hole about the diameter of one-third of the whole round, put the two card circles together, and with long needlefuls of wool sew through the center hole and over the outer circle of card, so as to cover it completely and evenly; continue thus till the center hole is filled up, then with a penknife or scissors cut quite through the wool all around down to the edges of the card, and slip a piece of

FIG. 369.

wool of sufficient length in between the two cards, tie it tightly together, and trim the balls with scissors. The good shape of the ball depends upon the center hole being quite the right size. If it be too large, the ball will be rather flat; if too small, it will be oval in form.

THE BEARD.

WE masculines sometimes speak sneeringly of the earnest devotion paid to fashion by the female sex; but with what reason? True, there is in our female fashions a seeming (if not real) sacrifice of convenience, comfort, propriety, good taste, and even health at the imperative demands of fashion in the materials and make-up of all articles of dress and in the manner of wearing the hair. But who are to blame? We, her worshippers, defenders, admirers and protectors, do not tolerate in her any departure from the rules of the goddess fashion, and if there is any guilt or foolishness attached to the followers of this science I do not see why we men should not bear a part of it, for though we have taught our tailors that in the fashion of *our* apparel we will not tolerate much inconvenience to please them, still we will let our barber (if we tolerate one at all) play all manner of antics with our distinguishing feature, the beard.

The real difference in the folly of the two sexes is that the females follow an almost exact uniform

ity in their coiffures, while the men, as far as able, practice an infinite diversity.

I have lately amused myself by looking over the likenesses of noted men of the present age as they appear in our publications, and noticing the differences in the manner in which they are represented as wearing the beard. In nine numbers of the Phrenological Journal of 1875 I find 35 likenesses of eminent men, and in these many styles are shown.

I have also the likenesses of 38 eminent men residing in the Fifth Congressional District of the State of Michigan, which show great diversity of style.

Now let us moralize over these facts. It has been said "there was nothing made in vain," and I have heard this class of men debating the question whether or not the beard of man was inflicted as a punishment for original sin. As for me, I verily believe it a blessing, and I agree with Dr. Holland in advising "if you have a beard, wear it," and if you ask me, as others have, "Why, if the beard is a blessing was it not given to woman?" My reply will be *I don't know*, neither am I disposed to criticise the works of the Creator, but to admit that "He doeth all things well." Of the eminent men of the age it seems that only 16 out of 73, or less than 22 per cent., hold to the above doctrine, but undertake to improve upon the works of the Almighty. S. B. P.

[Although not strictly woman's matter, the above article is inserted with the presumption that it will be accepted with interest.—R. C.]

OLD MAIDS ONCE MORE.

On page 726, Oct. 30, No. of RURAL NEW-YORKER appears an article over the signature, Dr. A. E. S., which in my estimation is exceedingly superficial.

He says he is a bachelor of nearly 24 years. Does he mean he has been a bachelor 24 years, or that it is 24 years since he was born?

No man can claim the honor of bachelorhood who has seen only 24 years.

He says he is pleasant and always meets the ladies with a smile (oh) and tries to do what is right in regard to the ladies' welfare—has a strong desire to offer his heart and hand to some maid, for, he says, "I am faithful and kind." Now judging from the very transparent article over his initials, I think he will render himself sufficiently and acceptably serviceable to old or young maids in keeping away from them. He delights seemingly in lauding his own merits and singing his own praises, which is a very objectionable feature in any man's character. The article is not worthy a genuine M. D. I think maids old or young would advise the Doctor to study human nature a little more thoroughly; in the mean time put aside his "strong desire" which savors more of beardless youthfulness than a reasoning, intelligent, experienced bachelor.

OLD MAID No. 2.

FASHIONS.

Black lace scarfs, wound round and round the throat and fastened at the left side with a silver brooch, appear to be more fashionable than ever.

The new glove is the Sara Bernhardt, which fastens only at the wrist, and above it is closed like a stocking and wrinkles stylishly on the arm.

Imported surtouts are not as long as those made here and more nearly resemble basques than the polonaises, for which surtouts have been considered a substitute.

The demand for diamonds is very great this year.

The garnet shade is much brighter than formerly.

Cardinal red is now presented in much brighter shades.

Bonnet string are shirred at the ends and trimmed with tassels, balls, lace and fringe, as suits the fancy.

Ostrich feathers are used profusely on bonnets and hats.

The popularity of plush is unbounded, and plush jackets with basques added to them are used with cashmere skirts of every color to match. The sole trimming consists of large and handsome buttons, which are very fashionable indeed. The Tam O'Shanter hat or the drawn bonnet matches the plush.

The new Winter petticoats are winsey. Some have the lower edge half a yard deep, embroidered in a contrasting colored silk, such as old gold or cardinal or dark blue, in spots the size of a florin. Others have equal and unequal perpendicular stripes of a contrasting color, the newest interwoven with tinsel. The material is wide enough for the depth of the skirt.

Fancy cloths are fashionable for ladies' Winter suits; they are of some dark tint with dashes of bright color—red, yellow and blue, which, however, are not very visible unless you look quite close.

Serge and cloth dresses in tiny check patterns are fashionable in very dark or neutral tints, which are very generally, however, brightened up by some touch of red either in the trimmings or the cravat or bonnet.

Indoor jackets are made this month of navy-blue, or seal-brown cloth, with borders of Turkish cashmere of the brightest colors. Ruffles of yellow lace are worn round the neck and wrists.

Plaids have quite come into favor again; skirts are made entirely of thick plaid surah, of ribbed texture, kilted all the way up; the coat bodice is of some self-colored material, and the rest is embroidered of the prevailing colors of the plaid pattern.

The new Winter bonnets are conspicuous for the beauty and richness of the materials of which they are composed; fancy shot velvets, satins and plush as soft and as fluffy as down. Their shapes are in general large and protruding, though some exceptions still appear in the way of close capotes,

ABOUT WOMEN.

VINNIE REAM HOXIE'S statute of Admiral Farragut is in position in Farragut square, Washington, D. C. It was cast at the Washington Navy Yard. It is of bronze out of the old propellor of Farragut's flagship, the "Hartford." It is of heroic size, and represents Farragut with a marine-glass in his left hand, and with his left foot resting upon a block and tackle. It stands upon a pedestal of Maine granite ten feet six inches high, and the total cost is $20,000.

IT is said that the Empress Eugenie has decided to leave England, being moved to that determination by Parliament having set its face definitely against the erection of a monument to the Prince Imperial in Westminster Abbey. It is thought that in the future she will reside at Chateau of Arenberg, Switzerland and her present intention is to erect a mausoleum wherever she fixes her residence, and remove the remains of her husband and son from England.

THE TOILET OF ELEGANCE.

For preserving the complexion—Temperance.
For whitening the hands—Honesty.
For sweetening the breath—Truth.
For removing stains—Repentance.
For improving the sight—Observation.
A beautiful ring—The family circle.
For improving the voice—Civility.
The best companion to the toilet—A wife.
To keep away moths—Good society.

A little Hop Bitters saves big Doctor bills, long sickness, suffering and perhaps death.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE KITCHEN CLUB RESUMES.

ANNIE L. JACK.

THE Kitchen Club met for the first time this Autumn at Dr. Read's, and we discussed the important subject of children's education. This topic must lie close to every mother's heart, and to none more so than to the hearts of farmers' wives who know that their little ones labor under many disadvantages. Long distances from schools, the busy times when all the help possible is needed at home, inclement weather with bad roads, and many other causes combine to irregularity, especially in the elder children's education. So we were cheered and helped by the talk of Mrs. Wheatly, a lady of superior learning, who is principal of a distant academy; for she told us that no class came to her school that she so gladly welcomed as the thoughtful, quiet boys and girls of farmers. They are not so frivolous, so easily led into mischief or so prone to evil as the children brought up in towns and villages, who come in contact with all sorts of people and influences, and we thought of Lincoln and Greeley and of the immortal Daniel and of the young David who tended his flocks; of the Patriarch Abraham, and of all the other great lights of the world who have been agriculturists in their day and generation, and thinking, we took courage. Who knows, but with such snatches of teaching as they can receive, with nature for their best and truest guide, with plenty of good reading and the fruits and flowers of the earth in their season ever near them, farmers' children may not miss so much the technical knowledge so valued and so valuable. The boy who works hard at Latin and algebra amid work to be done and many difficulties, will prize it more than if taught to gain his mental pabulum, as it were, with a silver spoon. All this and more we said to each other, and after a unanimous vote against sending children too early to school, and regarding other things of local import, our meeting broke up in the early twilight and we decided that in the education of our children we were by influence and example *all* instructors, that it was not all learned in the confinement of the schoolroom, with perhaps strange teachers who did not study the temperament of their charge, or know that "There are more things in heaven and earth than has been dreamed in their philosophy."

SUNDRIES.

Breakfast-Cakes.

MY family are much addicted to breakfast cakes of almost any kind, so I have rung the changes on various sorts until the opening of the buckwheat season, which casts everything else into the shade. With a long griddle, which bakes eight cakes at a time, it is but little trouble to supply a family at breakfast with cakes, even on a rather warm morning. A sort we like very well is made of two cups of boiled rice, two cups of buttermilk, two eggs, an even teaspoonful of soda, and flour enough to make a thin batter. A spoonful of molasses improves the color. The same cakes with two cups or more of soaked, stale bread in place of the rice, are very good. Soak the bread over-night and pour off the water in the morning, mashing the bread fine. But the best of all, we think, are made of grated green corn, mixed up in the same way. If you will only shut your eyes you may fancy you are eating fried oysters. Always remember that a rather thin batter and a hot griddle are the secrets of having nice cakes of any sort.

Much has been written against the use of buckwheat, but after twenty years' trial I have failed to see any ill effects of it in my family. It seems to suit all members, whether active school children, or those in sedentary employments. We eat buckwheat cakes for breakfast from Fall until May, if we can buy the flour so long. Very likely it is with this as with almost everything else, what agrees with one household may not with another.

It is healthful and appetizing to invent a variety in even the common staples of every-day fare. Now, bread is an article we expect to see on our tables three times a day the year round, and we never tire of it; yet even here one can have much variety, as you will agree after turning the leaves of the cook-book. But it is not good policy to make a kind your family do not like. I could never convince my family that Graham bread, or gems, or anything in that line was good, and as they were all in good health without it, there was no occasion to try it medicinally, so we dropped it. A light corn-bread made with baking powder and one egg we think excellent. Two eggs are apt to make it tough, though light. As a general thing, it is well to cook what your family like rather than what "they ought to like," and I often feel sorry for a poor child who is perhaps forced to eat food for which he has a real antipathy. A lady told me how much she endured in childhood in the endeavor to "break her in to eating mush and milk." The sight of it now always called up the old feeling of loathing. Nature is a good housekeeper and knows what is wanting in her larder better than we can tell her. It is well to listen rather more than we do to her suggestions. AUNT EVA.

To Protect Silver-ware from Tarnishing.

Mr. Strolberger, a silversmith of Munich, tried various unsuccessful ways of protecting his wares from discoloration in the show windows. At last he hit upon the expedient of coating his silver with a thin coating of collodion, which he found to answer perfectly. The article is first warmed and then painted over carefully with collodion diluted with alcohol, using a wide, soft brush for the purpose. Silver goods thus protected he states have been exposed in his window for over a year without growing dim, while other pieces not protected become black in a few months' time.

We have never tried this recipe, and therefore give it for what it is worth.

To Clean Baby's Kid Shoes.

"There, baby Denton," said I after we had returned from the fair, "your pretty blue shoes are past best wear, unless milk, soap and flannel will work wonders." Thinking they could not look worse, I wet one end of a small piece of flannel in sweet milk, rubbed on a little *white* soap and then rubbed the soiled kid with it. I was careful not to use the flannel after it became soiled, frequently applying soap and milk to a fresh place. Well, the shoes were much improved by their soap and milk bath and will do little one-year-old good service yet. MARY B.

Camphor Ointment.

One tablespoonful of brandy, two tablespoonfuls of beeswax, three tablespoonfuls of sweet oil, one teaspoonful of strong spirits of camphor.

Chocolate Cake.

One cup of sugar, one-half cup of butter, four eggs, the whites beaten to a froth, one and a half cup of flour, one teaspoonful of baking powder. For filling, take a quarter of a cake of Baker's chocolate, to it add a cup of water, boil, then add a cup of milk and when it again boils stir in a tablespoonful of corn starch dissolved in a little milk. Boil, then sweeten to taste and flavor.

Soft Molasses Cake.

One cup of molasses, one cup of butter, one cup of sugar, one cup of milk, two eggs, one teaspoonful of saleratus and four cups of flour.

Orange Pie.

Juice and part of grated rind of two oranges, the yelks of four eggs, two tablespoonfuls of butter, one cup of sugar. The whites are beaten to a stiff froth, a little sugar added and then spread over the top after the pie is done. Return to the oven to become slightly browned.

Sausage Meat.

To 10 pounds of meat allow one-fourth pound of salt, one ounce of pepper, one-half ounce of allspice, and if liked one-half ounce of sage.

For Curing Hams.

Eight gallons of water, 14 pounds of salt, one quart of molasses, one-half pound of saltpeter. After the meat is cut, place on a board and let stand over-night. In the morning rub with fine salt, pack into a cask and pour over the above mixture.

Curing Beef.

Four gallons of water, six pounds of salt, four ounces of sugar and two ounces of saltpeter. Cut up the meat, cover with a weak brine and let stand 24 hours before covering with the above.

Indian Bread.

One quart of fine Indian meal, one and one-half pint of wheat flour, three pints of milk, four eggs, two good teaspoonfuls of baking powder, one-fourth pound of butter.

Molasses Crullers.

Two teacupfuls of molasses, two teacupfuls of cream, two eggs, one teaspoonful of saleratus, and flour to mix and roll.

French Cake.

Four tumblerfuls of flour, two and a half tumblerfuls of white sugar, one tumblerful of milk, one-half tumblerful of butter, three eggs, juice of a lemon and two teaspoonfuls of baking powder. MRS. AUGUSTUS HEWLETT.

The only safe and sure cure for Gravel or Urinary troubles, is Hop Bitters. Prove it.

Miscellaneous.

ST. JACOBS OIL
TRADE MARK.

THE GREAT
GERMAN REMEDY.
FOR
RHEUMATISM,
Neuralgia, Sciatica, Lumbago,
Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains, Tooth, Ear and Headache, Frosted Feet and Ears, and all other Pains and Aches.

No Preparation on earth equals ST. JACOBS OIL as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of **50 Cents**, and every one suffering with pain can have cheap and positive proof of its claims.

News of the Week.

HOME NEWS.

MONDAY, Nov. 8, 1880.

THE Presidential Election resulted in the election of General Garfield, republican, by some 34 majority of the electoral vote. All the Northern States with the exception of New Jersey and Nevada went Republican.....Hamilton & Co's oil mill at Shreveport, La., was destroyed by fire on the 1st. Loss, $80,000; insurance, $49,000 .....Hon. John T. Keen, Mayor of North Danville, Va., was thrown from his buggy and died from his injuries on the 1st.....Chauncey P. Reeve, a farmer, aged 65, drove in to Middletown, N. Y., to see a doctor, and died on his wagon in front of the physician's door. Heart disease was the cause..... Robert Payne and Scott Thompson have been arrested at Danville, Va., upon the charge of being concerned in the death of Scott Hawkins, whose body was found in the canal at that place on the 23d ult.....Thaddeus M. Baird, a well-known citizen of Surrey County, Virginia, committed suicide by shooting himself through the head. A few days previously he attempted suicide with a razor. Deceased was for many years a conductor on the City Point Railroad.....Three brick buildings at Fort Dodge, Iowa, occupied respectively by Mr. Morgan as a drug store, the First National Bank and Beth Vincent, were burned on the 31st ult., involving a loss of $25,000; partially insured.

One of the buildings of the Laflin & Rand Powder Works, at Mountain View, about nine miles from Paterson, N. J., was blown up on the 3d, and two men were so terribly injured that they died the next morning. .....Ranker & Lutz's brewery at Fort Wayne, Ind., was destroyed on the 2d by an incendiary fire. The loss is $10,000..... While hunting in Dinwiddie county, Virginia, William Scott was accidentally killed by a companion named William Mabry.. .....The Interior Department has received dispatches from Ute Commissioner Meacham and Agent Berry announcing that they arrived safely at Rawlins, Wyoming, on the 1st, and that they would place themselves at the disposal of the authorities at Denver. Their roundabout route through the mountains was selected in order to avoid apprehended risks of mob violence in Southern Colorado.

The rain has enabled the Delaware and Hudson Canal to resume navigation, and several hundred boats, with 90,000 tons of coal, were waiting at Port Jervis for water. If the water lasts 6,000 tons will reach tidewater daily until the ice closes navigation.....A fire at Bayou Sara, La., on the 30th, destroyed a block of buildings, including Picard & Weil's store and dwelling, John F. Irvine's, Alexander's, Hart's, Brown & Co.'s and Martinez's stores and the telegraph office. Loss estimated at $30,000.....Mary Warnock, aged 15 years, employed at the Barbour Flax Spinning Mill at Paterson, N. J., while engaged in oiling a shaft was caught by the hair in the machinery and completely scalped, both ears being torn off with the skin of the skull. She was taken to St. Joseph's Hospital, but her recovery is hopeless ... .The Brush electric light is to be introduced into the Pennsylvania Railroad shops at Altoona. .....Thirteen men were precipitated into the bottom of a colliery shaft at Mons, Pa., and killed by the breaking of the hoisting apparatus on the 14th.

Policeman Fred. Kalsch was fatally shot by Charles Marshall, colored, at Cincinnati, on the 3d, while endeavoring to disperse a disorderly crowd.....The Memphis and Arkansas River packet, Ouachita Belle, struck a snag five miles above Austin, Miss., and sank within ten minutes. She had a good list of freight. The boat was valued at $20,000. No lives were lost.....During a Republican jollification at Frankfort, Ky., on the 3d, a difficulty occurred between Hon. William H. Sneed and Jerry Lee. The latter drew a pistol, when Officer Conway interfered and Lee's pistol went off in his hand, the ball taking effect in the lower part of Conway's bowels, inflicting what is thought will be a fatal wound. In a few minutes afterward Frank Egbert shot a negro boy named George Whittaker for hollooing for Garfield. It is thought he cannot recover..... The Memphis steamer Robert Mitchell, en route from Cairo to New Orleans, struck a hidden obstruction while making a crossing at Fox Island, six miles below Memphis, and sank. Her cargo consisted of 750 tons of grain and breadstuffs and 625 bales of cotton, all consigned to New Orleans merchants.

A fire originating in a small harness shop at Sturgeon Bay, Wis., destroyed Sellers's furniture store, the Northwest Telegraph Company's office, Mosse Brothers' hardware store, Palmer's barber shop, Amasse's meat market and restaurant, Reiffer's saloon, Collard's tailor shop, Gross' saloon and the village hall. Loss, $14,000; insurance light.....George Munro, the New York publisher, has endowed a chair of history, political economy and rhetoric at Dalhousie College, in Nova Scotia, the incumbent of which will be Rev. John Forrest .. ....In an election row at Lexington, Miss., J. W. Ashcraft was killed by T. J. Lockhart, the latter was fatally wounded and C. M. Hull, editor of the Holmes County Times, was painfully wounded.....A fire at Benicia, Cal., destroyed two brick buildings containing the construction department, machinery and bullet presses of the United States Arsenal. The loss is estimated at $200,000.....The Silver Lake woolen mills at Milfords, Del., were totally destroyed by fire, on the 2d. The loss is only partially covered by $4,000 insurance.

While Charles Stafford and Henry Vickery were digging gravel from a bank near Attleboro, Mass., it caved in and both were killed. The former was 37 years of age, the latter 35. Each leaves a widow and two small children.....The boiler of an engine on the Fall River and New Bedford Railroad exploded while drawing a train over a bridge. The engineer, George F. White, was killed, and the fireman, James Thompson, was severely injured. The train narrowly escaped being thrown from the track.....P. M. Mattison's flour mill at Faribault, Minn., was burned on the 30th. Loss, $20,000.....Charles O'Neill was fatally shot in the abdomen, at Cincinnati, during a street fight.....The boiler of the Atlanta (Ga.) Flouring Mills exploded on the 30th, killing the engineer and fireman.... The citizens of Arizona have been devoting the past week to receptions in honor of General Fremont.

In Sussex county, Va., Mattie Sharp was standing near a fire, when her clothing became ignited, and before help could be had she was fatally burned..... ..A band of thirty Apache Indians attacked a picket of twelve men of the Ninth Cavalry, 150 miles south of Fort Quitman, N. M., killing two soldiers.....The charter of the Cape Cod Ship Canal Company of New York will be revoked, the company not having complied with the terms. The Cape Cod Canal Company of Massachusetts will take up the work as readily as possible.....The articles of incorporation of the Chicago Driving Park were forwarded to Springfield, Ill., on Oct 30th. The incorporators are B. H. Campbell, H. V. Beamis and A. T. Richmond. The incorporation will have a capital stock of $1,000,000, divided into shares of $100 each.....A. B. Nichols, of Washington, D. C.; Hoyt Sherman, of Iowa, and J. B. Bloom, of New York, have been designated as Government Commissioners to examine the recently completed section of the Atlantic and Pacific Railroad fifty-two miles westward from Albuquerque, N. M.....The discussion for the proposed site for the World's Fair to be held at New York, in 1883, still continues vigorously with the proposition to hold it at Central Park.....The steamer Rhode Island went ashore on Bonnet Point, above Narragansett Pier, on the 6th, and went to pieces on the 7th. She weathered the heavy wind and rain storm that prevailed during the night, but with the incoming storm and tide she began to shiver and tremble, and for an hour or more presented a scene grand beyond description.....Four blocks in the business portion of Watford, Ont. were destroyed by fire on the 5th. Loss, $150,000..... From 200 to 300 miners have stopped work at Akron, Ohio. They demand an advance of ten cents per ton.

Frederick Kester, the Iroquois county wife murderer, will be hanged at Danville, Ill., January 21, 1881.....George Glass was shot dead on Thursday night at Madison, Ind., by George Watson or Frederick Treock. It is stated that Glass hurrahed for Jeff Davis and in the ensuing altercation he shot Watson in the leg, and it is supposed that Watson returned the fire, killing Glass..... Margaret Dempsey, said to be 111 years old, was found starved to death in her hut on the mountains near Ulsterville, N. Y.....Samuel L. Lawton, Township Collector of Delevan, Ill., and a prominent merchant, has disappeared. There is a deficiency in his accounts of $3,000. The total amount of his peculation is not yet known..... Sheriff Desmond, of San Francisco, has been indicted for felony in permitting the escape of prisoners; a citation has also been issued by the Grand Jury commanding Mayor Kalloch to show cause why he should not be punished for contempt in attacking that body in the prelude to a sermon last Sunday. The report attacks a number of county officials and institutions and praises others. It is noticeable that the unfavorable comments are confined to the officers elected by the workingmen.....A. Albert Mitchell, colored, was on the 5th hanged at Louisa Court House, Va., for the murder of Charles K. Walton, in March 1879. Mitchell had been sheltered by Mr. Walton in his store on the night the murder was committed. As Walton lay asleep on the side of his bed Mitchell struck him twice with an iron bar and then proceeded to rob the money drawer. While thus engaged Walton called out to Mitchell who struck his protector another blow, which killed him.....A special from Leadville, Col., says Eldridge J. Dawson, Assistant Postmaster, and Edward A. Clark, Stamp Clerk, were arrested on the 5th, on a charge of stealing Government funds. The amount of their deficiency is about $6,000.

FOREIGN.

In Ireland the excitement is still increasing. The government has added more names to the list of the leaders of the Land League indicted, so that they now number 13. A couple of weeks ago Mr. Healy, private secretary to Parnell, was arrested on the charge that he with another had "intimidated" a farmer who had taken a farm from which another tenant had been evicted on refusing to pay a thoroughly exorbitant rent. They had merely advised him not to be "odd" and incur the ill-will of his neighbors. The trial is yet to come off, but meanwhile Healy has become a candidate for Parliament for Wexford. This is only a sample case of a government prosecution instantly making an insignificant person a personage of importance. Meetings are constantly being held throughout the country, at which language more and more inflammatory rouses still more the ardent national temperament; the resolution seems to be hardening to resist at all hazards rent-paying except at a figure satisfactory to the tenants; the English determination to "put down" all opposition also appears to gain strength; the Channel fleet has been ordered to the Irish coast, and the announcement has excited "indescribable excitement."

In France the members of the last of the "unauthorized" religious orders have been driven from their homes and the Republic is happy. They were said to be "unauthorized" because an obsolete law of the beginning of the century said that they, having many foreign members, must be authorized by the State to dwell in the country. It was a vestige of the state of society under the heathen French Revolution, was forgotten for years, and resurrected the other day when the government were defeated in the Senate on a law they wished to pass against the Jesuits.....In Russia the Tzar is still unwell at Livadia, and negotiating with his legitimate children about the future status of his illegitimate, ones after his death. The Princess Delgorouki is to be declared Tzarina, anyhow, and her children will probably be legitimatized and acknowledged princes and princesses "of the blood." This is the chief question that now engrosses the moribund head of the Russian Empire and the Russian Church, while his subjects are starving in many of the provinces and the Nihilists are once more inspired to fresh excesses by the conduct of the supreme ruler and wretchedness of his subjects.

Prince Gortschakoff is again reported very ill and unlikely to recover.....Persia has refused to allow stores to be sent to the Russian General, Skobeloff, who is warring against the Turcomans, on the ground that the crops are poor. Were not such the case in Russia, the army would have been supplied from home.....The Kurdish invasion of Persia is being repulsed with great loss. Thirty of the invaders have been crucified for committing excesses.....Dulcigno has not yet been surrendered, but the Sultan has sent a sealed letter to Dervisch Pasha, commander of the Turkish troops in the neighborhood, and it is supposed that it contains an order to give up the town at once at any cost, as a council of the Ministers, held at Constantinople on Saturday, advised such a measure..... The Porte has decided to raise the strength of the army in Thessaly and Epirus to 42,000 men; the Greeks having 48,000 ready to invade those provinces, a part of which they claim. .....An International exhibition is to be held in Berlin in 1882.....During last week an international "go-as-you-please" six-days' pedestrian match was held in London, at which Rowell, the plucky, chunky little Britisher, once more came out ahead, beating Hart's time in the last competition here, by one mile, thus making the best record ever attained. Nearly a dozen started, but three only kept on to the end—Rowell, who scored 566 miles, Littlewood, 470 miles, and Dobler, 450 miles. The last was the only "survivor" of three Americans who started. The receipts were only £1,200, or $6,000, of which Rowell's share will be hardly one-tenth of what he received in this city. The next match will probably be held here—there's a world more money in it.

[Kalamazoo, (Mich.) Daily Gazette.]

It is an unprecedented success said Mr. Chas. S. D'Arcambal, the well-known Burdick House druggist, when asked for his views in regard to the St. Jacobs Oil; it is highly extolled, and is giving general satisfaction.

AGRICULTURAL NEWS.

THE NATIONAL FARMERS' ALLIANCE.

If the farmers of the country were as closely united with regard to legislation hostile or friendly to their interests, as are those engaged in other industries, they would have little cause of complaint of unfair taxation, oppressive railroad exactions, or legislative neglect of measures conducive, if not essential, to their welfare. United, their numbers would force legislation in accordance with their just demands; without State or national unanimity of action, the injustice to which they are often subjected and the salutary measures they have a right to expect are alike disregarded by our law-makers, with whom expediency and self-interest are usually more potent than justice or the national welfare. Combination alone can right this wrong, and effective combination is impossible without organization. Hence the necessity of associations such as the Grange, and the Farmers' Alliance. For its social, economic and educational benefits the Grange has deserved well of the farmers of the country, and in these respects we heartily wish it length of days, increase of numbers and growth of prosperity. But while it has done a good deal for the farmer in these directions, the National Farmers' Alliance, just organized, promises to do a good deal for him in another. The Grange has meddled little in politics; the Alliance, while non-partizan, proposes to work against class legislation and the encroachments of concentrated capital and the tyranny of monopoly; to provide against being imposed upon by swindlers and swindling advertisement in the public prints; to oppose in their respective political parties the election of any candidate to office, State or national, who is not thoroughly in sympathy with the farmers' interests; to demand that the existing political parties should nominate farmers or those who are in sympathy with them for all offices within the gift of the people; and to do anything in a legitimate manner that might serve to benefit the producer. In so far as it honestly pursues these aims the new association shall receive our hearty support, and in so far as it attains them, our sincere applause.

THE CHICAGO PORK CORNER.

The inside history of the great Armour "pork corner," to which reference was made editorially in the RURAL a couple of months ago, in which the Armours made a profit of $7,000,000, came out in Chicago on Friday last. The history of the operations goes back to the Summer of 1879, at which time Phil. Armour and his Milwaukee partner, John Plankington, went to Europe with the intention of "cornering" the pork market of the world. They were abroad about two months, and during their absence ordered the purchase here of an enormous amount of provisions, including 60,000,000 pounds of ribs, bought at less than 4½ cents per pound, and 150,000 barrels of pork at an average of only $8 per barrel. On their return to America in September they found the market strengthening. Prices went up and they realized a profit of $2,000,000. In the next two or three months pork advanced to $14 per barrel, and ribs in proportion. Under the impression that the boom was going to continue they made further purchases. Then came the reaction, pork going from $14 to $9.25 in spite of all that could be done to bolster it. The $2,000,000 went and another $1,000,000 after it. The members of the firm at once set about retrieving their losses, and sent agents through this country and Europe, and from the reports made satisfied themselves that the product of the hog would be in demand for the ensuing four months. They began in April to purchase all the actual stock of mess pork in Chicago and a trifle over 100,000 barrels in store in other cities. This they bought at prices ranging from $9 50 to $10 50, the average being about $10. In addition they secured "options" on 1,250,000 barrels more, so that they could claim this quantity in the future at certain specified figures from other parties, and then awaited developments. They took occasion to let everybody know that they had all the pork in existence and a great deal more. The manipulators had laid their plans to force the price up to $20, but they wanted it to go up gradually. But, when it became apparent to the traders and speculators that a great bull movement was on foot, prices were run up with such rapidity that it was feared the effect would frighten off the "shorts" and induce them to settle too early. To prevent such a move the Armours threw nearly a half million barrels on the market, and this served to check the boom and keep it within their control, and at the same time produce the impression that they could not or did not carry out their published programme of forcing quotations to $20. Operations were not alone confined to America, but all of Europe was taken in, and wherever men were found willing to sell pork they did not have, the Armours were graciously accomodating. They knew that they held all the pork and that those who had sold them the article would have to come to them for it or settle the differences. The amount of money that was placed against this game was enormous. In striking this balance the lucky owners of the "brace" find they have made not less than $7,000,000. In other words, they got back the $3,000,000 lost when pork went down last Winter and $4,000,000 besides. The Wall Street dealers feel as hard as their Western brethern in misfortune, and a vast sum of New York money is placed to the credit of the Chicago "bulls."

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and seaboard ports, and the rail shipments from Western lake and river ports:

Last Saturday a meeting of gentlemen interested in the N. Y. State Agr'l. Experiment Station took place at Garden City, L. I., embracing some of the most intelligent of Long Island farmers. Dr. A. S. Heath, of the American Institute Farmers' Club, who presided, said that although it is probable that the site of the State Agricultural Station will be a hundred acres on the Stewart estate, the Director of the station will make experiments on the lands in every county in the State, thus giving every part of the commonwealth all the advantage that may be gained from the existence of such an institution.....Subsequently a resolution was passed unanimously that it was the sense of the meeting that the experiments should be so distributed as to make every county a participant in the benefits arising from the station. A gentleman said that Garden City will undoubtedly offer such attractions as will influence the founders of the State Agricultural College in fixing upon a site for that institution. It is not improbable that if the projectors of the college select Garden City their college may start with an endowment that will make it from the outset the best institution of its kind in the world.....In view of the increasing business of those Long Island farmers who are selling vegetables and milk in New York City, it was agreed to ask the Long Island Railroad Company to run a night train for that industry. The farmers who are thus to be benefited dwell within about thirty miles of the city, and their number has been largely increased within three years past. They ask for such facilities as shall enable them to deliver vegetables absolutely fresh from the ground.

The Elmira Farmers' Club offered premiums to boys for the largest yield of corn from a given portion of an acre. These premiums have been recently awarded. The largest product was at the rate of 110 bushels and 30 pounds per acre. Manure had been applied at the rate of 60 loads per acre, which at the rate of $2 a load, made the corn come to $1.43 per bushel. But in many places the manure would be reckoned at only $1, and a strong soil would hold more than half its value for succeeding crops. The crops of the other applicants were 69, 69, 66, 56, and 53 bushels per acre. Even at the high cost mentioned, the experiment was a praiseworthy one, as showing the possibility of the crop.....J. N. Marden, Jr., of Baltimore, Md., owns a pear farm in that State, which is the largest this side of California. It contains 15,000 trees. Last Spring he tried the experiment of keeping the frosts away by building fires around 2,500 of the trees on frosty nights. The rest of the orchard produced a comparatively small quantity of pears, while the field around which the fires were kept yielded 3 000 boxes which sold for more than $6,000.....Shipments of flour from Minneapolis Jan. 1 to Oct. 20, of the present year amounted to 1,464,595 barrels, and shipments of mill stuff during the same period amounted to 52,598 tons.....The gate receipts of the fair in Indianapolis, this year, were about $14,000; last year they were over $18,000, but, owing to the decreased expenses this year, the net receipts are as great as those of 1879, viz—$4,000.

In California Missouri grapes are sold from growers to wine makers for $20 to $27 per ton, and foreign grapes for $27 to $35, against $14 to $16 for the former, and $20 to $26 for the latter, last year.

.....The phylloxera has been ravaging the California vineyards, having during the last eight years laid waste about 700 acres in the Sonoma Valley.....Chicago's fruit trade, as shown by the U.S. census returns, foots up the annual aggregate of $16,592,890, and proves Chicago one of the greatest fruit markets in the world.....The culture of flax is greater in Russia than in any other country. In 1878 the quantity exported was valued at £8,000,000—$40,000,000—or 10 per cent. of the total exports.

THE Mark Lane Express says that the markets of this country will never be supplied with first-rate mutton so long as American breeders prefer Cotswold to Down sheep.....At a recent sale of rams at Melbourne, Australia, three Tasmanian Merinos realized 175, 150 and 125 guineas each, or about $925, $760 and $735.....Pleuro-pneumonia is now prevalent in most of the settled districts in South Australia .....Prof. Toussaint, of the Toulouse Veterinary School, France, is reported to have discovered a preventive of anthrax, or black-leg, which bids fair to be an invaluable preservative from this fatal disorder. So highly is the discovery esteemed in France that the government has already rewarded him, while the Academy of Sciences has conferred one of its most valuable prizes on him. At last accounts he was inoculating a large number of sheep in districts in which the disease was very destructive.....The inroads of the phylloxera are on the increase in the department of Savoy. At the close of 1879 there were 68 points attacked, extending over 65 acres; but the disease has now appeared in 175 fresh places... ....By last accounts from the Argentine Republic, the wheat sown there in August was very promising, and the acreage considerably larger than last year.....In New South Wales a heavy snowfall, on August 21, did much injury to crops .....In Victoria and South Australia a great deal of damage was done by heavy rains; and the rabbit pest has been brought to the notice of the government.....In Queensland late wheat had hardly appeared above ground on August 7th; the weather was fine and the sun hot for that wintry season. At Cape Colony drought was complained of under date of Sept. 14, making the pastures short; but ostrich farming was reported highly profitable, sales being at excellent prices—four-year-old birds selling for $350 to $575 per pair; and breeding birds from $625 to $1,000 a pair.

Railroad freights from Chicago and other points in the West eastward were advanced five cents per cental on Nov. 1 on boxed meats, hog products and live hogs.....A national anti-horse-thief convention lately held at Keokuk, Ia., was largely attended by delegates from the seven nearest States.... ...The ocean insurance on live cattle has been advanced to 12 per cent. as Winter is on us, and it is expected that shipments of live cattle from New York will now decrease, while beef shipments will correspondingly increase. Ice has dropped from $10 to $7 per ton .....Hog packing houses are being erected in many parts of the West .....More oleomargarine is shipped to Rotterdam than to any other European port. Glasgow, Scotland, receives about half as much. More than four times as many cheeses are shipped to Liverpool than to any other European port. Glasgow holds second rank.

Figures Don't Lie.

SPARTA, Union Co., Oregon, May 30, '79.

BUTTER IMPROVEMENT Co., Buffalo, N. Y.:

Sirs—The package of "Butter Maker" forwarded by you to W. W. Ross, Esq., of this place, was handed over by him to me for trial, and orders to report the results to you, as I have the management of his dairy.

I have the honor to report that one gallon of sweet cream churned at a temperature of 65 deg. and treated with the Butter Maker according to directions accompanying package, produced four and one-half pounds of butter of a fine golden color, and firm, waxy texture, and of delicate flavor; time occupied in churning and gathering the butter, twenty minutes.

One gallon of sweet cream, same lot, churned without the powder, produced four pounds of butter several shades lighter in color, not so firm or waxy in texture, but no perceptible difference in flavor; time occupied in churning, at same temperature as above, forty-five minutes. The fine, even grain, rich, golden color, increased quantity from the same amount of cream, and the difference of time occupied in the churning and gathering the butter, are greatly in favor of using your preparation, and I have no hesitation in recommending the same to my friends and the public generally. Very respectfully, your obedient servant, GEO. W. EASTERBROOK.

LYDIA E. PINKHAM'S VEGETABLE COMPOUND will at all times, and under all circumstances, act in harmony with the laws that govern the female system. Address Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass, for circulars. Sold by druggists.

TROPIC-FRUIT LAXATIVE removes Habitual Costiveness and all kindred complaints. It is composed entirely of concentrated fruits and medicines. Druggists sell it.

When worn down and ready to take your bed, Hop Bitters is what you need to relieve you.

Burnett's Cocoaine allays irritation, removes all tendency to dandruff, and invigorates the action of the capillaries in the highest degree. The COCOAINE has earned a deserved reputation for promoting the growth and preserving the beauty of the human hair. Ladies dressing their hair elaborately for the evening will find it imparts a healthy natural gloss to the hair, and will cause it to retain its shape for hours.

The Markets.

SPECIALS FROM THE CHIEF CENTERS

Until Saturday, Nov. 6.

Boston.—WOOL.—Last week prices increased considerably and the improvement is fully sustained. Many manufacturers have been buying freely, some of them stocking up ahead in view of a probable advance in the price of all kinds of wool Were there the usual supply of water to the mills purchases would be even heavier. About 3,000,000 lbs. of domestic wool have been sold during the week, mostly to manufacturers but some to dealers. At the close 43c. are wanted for good wool and some are holding for 45c. As to Ohio washed fleeces, one large house sold for 47c. at the close of the week when five days before they only realized 45c. for the same grade. Pulled wools are looking up, and they are now held 1½@2c. higher, with considerable sales at a substantial advance. Advices from the country are that wools there are still more strongly held, and that 42@45c. are insisted upon for choice Ohio and Pennsylvania. The San Francisco market is moving along quietly and firmly with sales at 24@25c. for nice free Fall, and so down to 12½c. for poor and burry. The receipts of domestic wool during the week were 5,837 bales, against 2,128 for the corresponding week last year. The total receipts of domestic wool since Jan. 1 have been 238,993 bales, against 259,264 last year.

Cincinnati.—WHEAT strong: No. 2 Amber, $1.04½ No. 2 Red Winter, $1 05. CORN firm; No. 2 Mixed, 44½c; New ear, 40c. OATS dull; No. 2 Mixed, 32½@33½c. RYE easier; No. 2, 89@90c. BARLEY in fair demand; No. 2 Fall, 95c. PORK dull and nominal at $14. LARD strong at $9.10: Bulk-meats in good demand: Shoulders, 7½. Bacon quiet but steady; Shoulders, 5½c; Clear Rib, 8½c; Clear Sides, 8½c. Hogs active and firm; common, $3.90@4.35; light, $4 40@4 60; butchers', $4.65@4 75. BUTTER—Dairy is not in excessive supply, and the average quality is good, but really fine is not plenty and the bulk of the sales are at 20@23c .only a moderate amount being good enough to bring more. The lower grades are slow but are generally worked off at previous prices. Packers are not buying much of any kind. Fancy Creamery sells at 31@32c, and prime at 28@30c, choice Dairy at 23@25c, choice Western Reserve at 22@23c, prime to choice Central Ohio at 18@20c, common at 15@17c and inferior at 10@13c. ₱ lb. CHEESE—Has been in moderate jobbing demand and with more free offerings, the tone of the market is easier and prices are a little lower, prime to choice mild factory selling at 12½@13c ₱ lb. SEED—There is only a moderate business in this line; dealers bid 6½@7c. for good to prime Clover and 7½c. ₱ lb. for fancy; there is no consumptive demand. Timothy seed is offered at $2.50@2 55 ₱ bushel for prime in store, and dealers bid $2 35 on arrival. Dealers buy Flaxseed at $1.15 ₱ bushel.

Chicago.—WHEAT steady; No 2 Chicago Spring, $1 01¾@$1.02, cash; $1.03¾ bid, December; $1 04½ January. CORN in good demand and a shade higher at 40c cash; 40½c@40⅝c. December; 40¾c. January; 45¼@45½c. May. OATS moderately active at 29½c.@29⅝c. cash; 30¼c. bid, December; 33c asked, May. Rye and barley steady and unchanged. PORK unsettled, at $13 75@14 cash; $13.-12½. November; $12 20, December; $13.40, January. LARD fairly active and a shade higher at $8.07½@$8 10, cash; $8, December and January. BULK MEATS unsettled; Shoulders, $4 60; Short Rib $7 34; Short Clear, $7 45. BUTTER.—Creamery, 26@30c; dairy choice 24@25c; dairy, fair to good 22@23c; ladle packed 17@20c; packing stock 13@15; Grease 8@10. CHEESE, full cream, September and October 12½@13c: full cream, August 12@12½c; part skim, September flat 11½@12c: part skim July and August 10@11; full skim 8@10c SEEDS. Timothy at $2 20@2 44 prime closing at $2.37½@2 40. Flax-seed sold freely at $1.28 and was quoted weak at the close. Prime medium clover sold at $4 50 and closed at $4.57½ Millet and Hungarian were quoted at 45@50c.—HOGS: market active and firm; mixed packing, $4 50@4 75; choice heavy, $4 80@5; light, $4.60@4.80; market closed quiet and weak. CATTLE good scarce; exports firm at $5 30@5 60; good to choice $4 70@5.10; common to medium, $3.75@4 40; butchers' slow; common to fair, $2 @3 50; good, $2 75@3 75; stockers, and feeders, $2 40@3 10; Texans, $2 60@3. Sheep common to medium, $3 25@3 75; good, $4@4 25; quality poor. WOOL was quiet and firm. The improvement East has a bracing effect here, and dealers expect a revival of trade at an early day. Good to choice medium tub 45@46c; coarse or dirty tub, 39@44; fine unwashed fleece 20@25c; coarse unwashed fleece, 2½@23c; medium unwashed fleece 29@31c; medium washed fleece, 38@41c; fine and coarse washed fleece, 35@39c.

St. Louis, Nov. 6—WHEAT, No. 2 Red Fall, $1.01@$1 01¾, cash and November; $1.04@$1.04⅝, December; $1.06¾@1.00 7-8, January; $1.08 7-8@$1.-09 3 8, February; No. 3 do., 94 5-8c@95 1-8c; No 4 do., 90c@91c. CORN, 39 7 8c, December; 40c, January; 44c@44 1-8c, May. OATS, 29 7-8c@30 1-8c, cash; 30¼c, November; 31c December. RYE quiet at 88c, bid. PORK quiet at $14. Lard quiet at $8. Bulk-meats dull and nominal. Bacon dull; shoulders, $5 12½; Clear Rib, $8.62½; Clear Sides, $8 87½. HOGS quiet; Yorkers and Baltimore, $4-25@$4.40; mixed packing, $4.35@$4 55; butchers' to fancy, $4 55@$4.75. CATTLE—Supply very light and wholly of low grades; mixed native butcher stuff, $2.25@$3.25; choice butcher steers would bring $3.50@$4; good Texans, $2.25@$3,25. SHEEP $3@$4, the outside price for fancy.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 6, 1880.

UNUSUAL interest in election matters caused a panic in general business from which it has not had time to recover. Values are only nominal in many items, but an early movement is predicted and current quotations are named with confidence, excepting where rates have reached a point which to some degree restricts free buying. Butter, eggs and some kinds of poultry come under this head.

BEANS AND PEAS.—The demand for beans is fair, but it requires colder weather to bring out a good business, especially for local use. New lead the trade. Green peas firm and not plenty. B. E. do. have little inquiry.

Marrow beans, new, $1.75; old, $1.52@1.65; medium, new, $1.50@1 55; old, $1.40@1.45; pea, new, $1.55@1.75; white kidney, new, $1.70@1.80; red do., choice, $1.70@1.75; fair to good, $1.45@1.50; black, or turtle soup, 1.55@1.60; green peas, perfect Wis., $1.90@2; So. B. E. peas, per 2-bush. bag, $1.80@1.85.

BEESWAX.—There is a moderate demand and a steady market; sales at 23½@24½ for Western and Southern.

BUTTER.—Exports are small and the home trade is merely filling limited daily wants. Western butter when named at the under grade of State have a fair sale for general use. The upper class of buyers insist upon perfection when the extremes are forced. Few sales of dairies reported.

Creamery, finest, 31@32c.; good to prime, 28@31c.; fair to good, 25@28c.; poor to fair, 23@26c.; sweet cream, 24@29c.; State entire dairies, choice, 25@26c.; good to prime, 24@25c.; fair to good, 23@24c.; firkins, 21@25c.; State pails and half tubs, fine fresh, 28@29c.; good to prime, 26@27c.; fair to good, 24@26c.; poor, 20@23c.; Welsh tubs, fall prime, 27@28c.; good to prime, 25@26c.; fair to good, 21@23c.; Western imitation creamery, 20@25c.; dairy, fresh, 22@24c.; good to prime, 20@22c.; fair to good, 18@20c.; factory, June, 17@19c.; do. current make, 20@20c.; other, 18@19c.; poor, 14½@16c.; grease butter, 9c.

Receipts for week, 38 761 bales. Exports do., 11,331 bales.

CHEESE.—A light exportation shows the dull condition of trade that has prevailed this week. Supplies have accumulated and prices have ruled weak. But few lots exceed 12¾c, but when a strictly fancy parcel is needed 13c is quotable. The good and medium grades have been most difficult to sell and for these buyers have had especially the advantage. Quotations are for

State factory, fancy, at 13c.: do. good and prime, 12½@12¾c.; do. fair to good, at 11@12c.; do. half skimmed, 9@10½c.; Wisconsin factory, fine, 12½@12¾c.; do. good to prime, 12@12½c.; do. fair to good, 10@12c.; Ohio factory, fine, 12@12½c.; do. good to prime, 11½@12c.; do. flat, fair to good, 10@11½c.; do. poor to fair 7@10c.

Receipts for week, 42,462 boxes.
Exports for the week, 35,000 boxes.
Liverpool cable, 67@68s.
Steam to Gt. Britain, 35@45s.

Comparative receipts and exports from June 1.

Ducks, Phila., d.-p. 13@16c.; State scalded, 11@13½c.; Western mixed 11@13c.; very poor, 8@10c. Geese, Phila 10@12c.; other, 8@10. Squabs, white, ₱ doz., $2@2 25; dark, ₱ doz., $1@1 25.

Live poultry very low even with moderate receipts. There will be no settled place for it after this date.

Chickens, N. J., ₱ lb, 8@9½c., State and Penn., 8½@9c; Western, 8c.; Southern, 7@8c. Fowls, N. J., 8½@9c.; State and Pa., 8@8½c.; Western, 8c.; Southern, 7@8c. Roosters, 4c. Turkeys, N. J., 9@11c.; Western, 8@9c. Ducks, prime, ₱ pair, 75c.; other, 40@60c.; Geese, choice, $1.62@1.75; other, $1@1.50. Pigeons, 25@30c.

Wild ducks are coming from all points; market low, outside rates for Havre de Grace. The weather is wet and mild, which is adverse to the game trade. The tone of the market is easy except for prime quail.

Canvass back ducks, ₱ pair, $1.00@1.75; red heads, 30@75c.; mallard ducks, 40@50c.; B. W. teal, 30@35c.; G. W. teal, 25@40c.; common, 20@25c; partridge, $1; Western, 75@90c.; Eastern, 60@80c., soft, 30@40c. Grouse, prime, $1; soft, 75@80c. Woodcock, State, dry, 40@50c; Western, 30@40c. Eng. snipe, ₱ doz., $1.52@1.70. Plover, $1.25@1.50. Sand snipe, 40c. Quail, prime, $2@2.25; do, other, $1.25@1.50. Venison Minn., saddle, ₱ lb 13@16c.; other, 6@12c. Whole deer, 9@10c. Hares, ₱ pair, 35@40c. Rabbits, 25@35c.

PROVISIONS.—Hog products have been active and closed strong. Latest prices are $15 for spot lots, $14 85 for Nov. Bacon at 8¾ for short clear and 7¾c. for long clear. Tallow at 6 5-16@6¾ for prime; stearine at 8¾@9. Beef hams at $16 75@17. Beef at $18.50@19 for tierced city extra. India mess 19.50 for barreled extra mess, and $8.50 for plain mess, $11@12 for packet. Lard at 8.70 for contract grade on the spot 8.52½@8.55 for November; 8.40@8.42½ for Dec. and Jan, 8.42@@8.45 for Feb.

SEED.—Clover is quiet; prime to choice quoted at 8½@9c. Timothy is inactive, quoted $2.70@2.80.

Receipts for the week 1,100 bush. Exports, 480 bags.

TOBACCO.—The market has not varied from last week and is moderately active.

VEGETABLES.—Exports of potatoes for week, 4,225 bbls. Outside prices are hard to obtain with continued liberal receipts. Peachblows scarce, but Rose give good satisfaction to the local trade. Eastern E. Rose, $1.75; State, $1.37@1.50; snow flake, $1.37@1.50; peerless, $1.@1.25. Onions scarce and firm, Garden truck in smaller variety

Tomatoes, ₱ bush., 50@75c.; turnips; w. ₱ bbl., 40@60c.; Russia, 50@75c.; beets, 75c.; cabbage, Flat Dutch, ₱ 100, $2 50@3.50; red, $3.50@5.00; Squash, Hubbard, ₱ bbl., 75c.@$1; marrow, 40@50c.; onions, white, $4.50@5 yellow, $3.50; red, $3.25@3.50; Chester, $3@$4.50; carrots, $1@1.25; pumpkins, ₱ 100, $4@6; cauliflower, ₱ bbl. $1@$2; celery, per dozen, $1.00@1.25.

WOOL.—There has been a very good trade this week and a strong market without change in prices. Latest sales include X and above Ohio fleeces at 45@46c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Nov. 6, 1880.

BEEVES.—Receipts for the week 12,848 head; do. last week 13,011 do. Liberal receipts, a broken week, several wet days and an overstocked meat market depressed trade badly, and the pens were not cleared even at a decline from Wednesday's figures. Cattle have generally lost money this week, mostly a common stock Texan hardly made 6½c.; Colorados sold at 7½c.; poor to fair native steers 6¾@8¼c. to dress 54@56 lbs; good to prime 8¾@9¾c. to dress 58 lbs; choice 10@10¾c to dress 56@58 lbs.

MILCH COWS.—The demand has improved but the trade is in few hands; common to prime milkers show a range of $30@55 per head; extra, $60.

VEAL CALVES.—Prices tame for general stock and the meat market is well supplied. Choice selections firm at the extreme.

Live calves, N. J. prime to choice 7¼c., State, good to prime, 7@7¼c.; other 5@6¾c.; Mt. Holly, heavy, 4@6c.; light, 6¾@7½c.; buttermilk, 3@3½c.; grassers, 2@2½c.; dressed N. J. prime 10½c.; State 10c.; fair to good, 8¾@9½c.; common, 8½@5½c.

SHEEP AND LAMBS.—Receipts for week, 28 870 head; do. last week, 31,344 do. The early prices of the week for sheep were barely supported at the close: poor to good 3¾@5¾c.; a few export head 5¾c. Lambs ranged 5@6¾c. A weak tone in sheep skins tends to check demand.

HOGS.—Receipts for the week, 34 408 head; do. last week 46,187 do. Market dull for live, closing easy $4 85@5. 0 per 100 for corn. New Jersey pork light, 7¾@8c; upper weight 8¾@7c: city dressed State 5¾@8c. do. Western 5¾@6¾c, pork tenderloins, 11c.

Reading for the Young.

THE ZOOLOGIST'S WOOING.

When I first saw you, Eland deer,
My heart it did repine;
Because I gnu how good you were,
And wished that you ermine.

When I your tapir fingers pressed
Upon that eve in May,
The glance you gave me sealed my fate,
And I am still yours toady.

I'll never break ape art the lynx
That bind my heart to thine,
Till I shall lion my last couch
And in my grave recline.

Gaze, Eland dear, upon me now,
(That's civet pleases you),
One glance from your bright eyes will light
This mole dering fire anew.

And if it is for porcupine,
Though it should ruin me,
I'll bring as many hamstu you
As one could wish to see

But then, of course weak antelope,
For that would be a boar;
But we can stay right here rat home,
And I'll never leave you mohr.

FARMING FOR BOYS AND GIRLS.—NO. 3.

HENRY STEWART.

Water and Its Uses.

No plant can thrive or grow without water. It is as indispensable to plants as it is to animals. Plants contain from 65 to 95 parts of water in every 100. Hungarian grass contains 65 per cent. of water while it is in blossom, while a pumpkin contains 95 per cent. Water is then the most important food for plants, because it supplies the greater part of their substance. But this is not the only office it performs in the growth of plants. It is equally useful in another way, and that is in bringing all the mineral or solid food to them in such a condition that it can be used; for nothing whatever is taken up by the roots of plants that is not dissolved in water. Every part of the soil, or of manure that may be in the soil, that enters a plant by its roots must first be dissolved in water; and the quantity of water that enters a plant in this way must necessarily be very great. For instance, all the water that goes into the roots of grass or clover during the growing season, if it were collected at one time, would stand 12 inches deep over the field. Every pound of wheat produced needs for its growth from first to last 200 pounds or more of water, and for every pound of ash, or mineral matter, that exists in a tree, or any other vegetable, 2,000 pounds of water have passed through the plant. No water is ever taken in by the leaves of a plant; all that is ever absorbed is taken in by the roots. The water thus taken in passes up from the roots and mingles with the sap; and after leaving behind it in the plant its load of dissolved matter, passes out through the leaves; and the more vigorously the plants grow, the more water they require for their sustenance in this way. On this account it is that in a wet season grass and other crops grow more than in a dry season. It does not matter how rich the soil may be, if there is not water enough for a plant, it will not grow in it. But if the supply of water is abundant, there may be a good crop on poor land, because the more water there is in the soil, the more of the soil will be dissolved and the plants will take up more water, if it is necessary for them to do so, to procure enough mineral food for their full growth. Again, it is one of the advantages of having good and rich soil, that in dry weather, when the supply of water is not abundant, the plants can procure all the food they need from a smaller quantity of it, and while crops are poor on poor soil, they may be very good upon rich soil. This is one of the ways in which the good farmer, with good land, escapes injury from a dry season; while the poor farmer, with poor land, suffers severely from a partial or total loss of his crops.

To secure a large yield of grass, some farmers practice a method of artificial watering which is known as irrigation. This consists of leveling the surface of the fields, forming banks around them and providing canals with gates and sluices by which the water from streams or reservoirs may be spread over the grass. In some cases as much water as would form a total depth over the field in the whole season of 50 to 100 feet is used in this way; either by flowing the field occasionally and leaving the water to remain several days until the soil is well soaked, or by causing the water to flow in a slow current over the grass continually. By this system of cultivation grass is forced to grow as much as one inch a day and to yield during the growing season as much as 80 tons of green fodder per acre in several cuttings. This is an interesting example of the value of water for vegetable growth, and goes to show that the extent of the product of the soil may depend in a great measure upon the quantity of water that is supplied.

Water is not a simple substance, but a compound of two gases, viz., oxygen and hydrogen, united in the proportion of eight parts of the former with one of the latter by weight, and by measure of one volume of the former with two of the latter. It is one of the most abundant substances in existence; it exists dissolved in the air in very large quantities; it forms three-fourths of the substance of every living animal; it is found in every stone and rock; it may be solid as ice, liquid as in its most common form, or in vapor as in steam or the moisture of the atmosphere, the latter of which takes the visible form of clouds or fogs when it is condensed by cold into very small round particles which float in the air, moved here and there by the winds. The office of water is so important in agriculture that every farmer should be interested to learn all about it.

NUT-BEARING TREES—No. 3.

The Beech.

This forest tree of the genus *fagus* is to be found in the temperate regions of the northern hemisphere on both continents. F. sylvatica is the common white beech of Europe. Of this the American tree grown in Florida and other southern States is taken to be a variety.

F. ferruginea, or red beech, has the leaves oblong, ovate, acuminate pubiscent beneath, coarsely toothed obtuse, and unequally subcorded at base; nut acutely three-sided, muricate; most frequent in the northern United States.

F. purpurea, whose bright blood-colored leaves, seem like a mass of flame when tossed by the wind, on a clear, sunny day is much prized as an ornamental tree for lawns and parks.

F. cuprea, also is sought for its peculiar copper-colored foliage, and F. pendula, or weeping beech, is also set in lawns and cemeteries.

The beech is easily grown from seed as also by grafting, budding and in arching. Ine th early Spring, if wandering in the woods or the near vicinity of beech trees, one will see, starting out from among the brown leaf-mats, little green, three-sided affairs, somewhat resembling growing beans. They are very dainty and white when first out of their brown shell, and very sweet to the taste, a sort of mixture between the flavor of a nut and a vegetable.

Soon the little affair opens again after the manner of a bean, and the two first leaves push out into the light, and the beech tree starts on its slow compact growth, scarcely ever bearing fruit until the 50th year of its age, and then not each successive year. The tree lives only about 250 years.

It thrives in a deep, moist soil, attaining sometimes, as on the banks of the Ohio, the hight of 100 feet, but it also succeeds well on a rocky soil,

AMERICAN BEECH.—FIG. 370.

and has been found growing among debris at the foot of rocky cliffs. When crowded by its kindred or by other trees its trunk rises pillar-like even to 80 feet before branching out, then making a sudden tufted crown. Standing alone it sends out branches at a hight of from 18 to 30 feet, at an angle far and wide, the lower ones almost horizontal, while the upper rise to form the majestic crown. Its light grayish or leaden-greenish bark, smooth and shiny, presents a tempting surface to pocket knives, and how many a man grown old away from the scenes of his boyhood, will be reminded of some shining bole by the song:

"N, for Nannie, and B, for Ben,
I see them now as I saw them then,
On the bark of the beech tree old;
She waist deep in the clover white,
While the mellow beams of the June sunlight,
Fell on her curls of gold."

Few boys or girls have grown up on the farms that have not in mind a beech tree somewhere with its "N, for Nannie, and B, for Ben," and the Summer idyl that died perhaps when the season faded, yet here is its silent grave-yard, and where it will remain long after the carver has forgotten the Summer and the tree monument. I mind me of a tree away by the side of a little singing brook, and on its smooth bark cut the words "My Birdie.' Alone it stands and the winds whisper it and the rill sings by, while lover and maid have gone out into the busy whirl of life.

Young beeches are useful for live hedges, as they bear pruning, and as their branches coalesce by being tied together. The wood is yellowish white in the common beech, brownish in the red, and very hard. Its close wood cells, with thick walls, afford a great quantity of heating material so that the wood ranks next to hickory and maple as fuel. It is also incorruptible when constantly under water. The tree is so rarely struck by lightning, that woodmen and Indians consider themselves safe while under its shelter. A very good oil is extracted from the beechnut, almost equal to that of olives, and keeping longer than any other after purification.

Wild animals feed on the nut, and swine revel and fatten if allowed a beechnut range. The little chipmunks or ground squirrels, tamias, trust to the beechnut almost exclusively for their Winter stores, making their tunnels in the ground in some quiet spot, carrying carefully away every bit of earth taken out of their excavations, in order to attract less attention, and lay up a store, in subteranean palaces of perhaps a bushel or two of nuts apiece and little boys, on mischief bent, are sometimes known to dig out these little storehouses and appropriate their contents, rather than gather them for themselves.

MAUD MEREDITH.

SOME SIGNS OF AUTUMN.

Just over the hill there, the woodpeckers are making preparations for the moonlight nights of the next fortnight, when, led perchance by a lordly log-cock, they will steer their way across the Gulf Stream to the uttermost south. Even now, dark though the nights are, they can be occasionally heard calling to each other across the tree-tops. The blue-jay will remain with us, but his gaudy plumage is already the worse for wear, and there is a droop to his top-knot in curious contrast with its bristling defiance when, seven months ago almost to a day, he sat upon the catalpa tree and noisily announced the approach of Spring. Even the children have developed a tendency to bring their playthings into the house; and there is something suggestive in the complacency with which the two-year old sits and watches the lonely white butterfly—the ghost of Summer time—flit in and out among the morning-glory vines. Two weeks ago, the same youngster would have sent his straw hat sailing after the wandering insect, but now he is content to languidly watch it drifting about with melancholy uncertainty. There is nothing in the morning-glory vines to attract the attention of a reasonable butterfly. The blossoms have closed and locked their doors. They hold their reception now from four to seven a. m., and the butterfly abroad that early, is likely to go home with the rheumatism.—Atlanta Ga. Constitution.

A FAITHFUL DOG.

A few days ago the engineer of a train near Montreal saw a large dog on the track, barking furiously. The engineer whistled, but the dog paid no attention to the noise, and refused to stir. The dog was run over and killed. The engineer observed that the animal crouched close to the ground as he was struck by the cowcatcher. A minute later the fireman saw a bit of white muslin fluttering on the locomotive, and he stopped the engine. On going back to where the dog was killed it was discovered that not only the dog, but a little child had been killed. It was then seen that the dog had been standing guard over the child, and had barked to attract the attention of the engineer. The faithful animal had sacrificed his life rather than desert his charge. The child had wandered away from a neighboring house, followed by the dog, and it is supposed that the child lay down and went to sleep on the track.

Correct Speech.—Correct speech is such an indisputable mark of a lady or a gentleman that it cannot be too often repeated that the true standard of pronunciation is one in which all the marks of a particular place of birth and residence are lost, and in which nothing appears to indicate any habits of intercourse other than with the well bred and well informed wherever they may be found. In the matter of accent, the aim ought to be to avoid all that is local, affected or vulgar. Let no transgressors imagine that they can escape with impunity. Their speech will betray them, and even well-educated children will be merry and satirical over them behind their backs.

The Puzzler.

HIDDEN BIRDS.

1. No, my little bird of Paradise no one is sure.
2. I pity the poor heathen.
3. Nape, a cocked rifle is very dangerous.
4. No, Jab, I (Ruth) deny it.
5. The nymph I custarded.
6. What a caper Callie cut.
7. Trundle your hoop? O, Eva! you are too big.
8. See that dot, Terel?
9. Will you sell your farm?
10. I, the glorious Spring do venerato.
11. Hiram Lecush at church.
12. See if in Charley's store they keep taffy.
13. The cannon-ball struck the stern.
14. What a wretch, Ough!
15. I like Agra best of all.
16. "Bedab! chickens are foine," quoth Pat.
17. For those who love beef, eat Erney's potted beef.
18. Moses is kind to every one.
19. This tilt is sure to win the prize.
20. Trees of palm I peddled.
21. He is noted for swiftness.
22. Watch Jmney's wall, Owen.
23. With a double-painted canvass belt, Du C. kept his tent dry.
24. For Obin, red-breasted shirts were sent from Paris.
25. Gastur T. led over his lame horse. L. O.

☞ Answer in two weeks.

A FRACTIONAL PUZZLE.

One-quarter of Noah; one-quarter of Abel; one-fifth of Herod; one-third of Ham; one-quarter of Shem; one-fifth of Hagar; one-seventh of Solomon; take one from each and form the most faithful man of the Bible. Little One.

☞ Answer in two weeks.

A DIAMOND PUZZLE.

A consonant; a pronoun; a sort of rock; a puzzle; an animal; a boy's nickname and a consonant; a vowel.

☞ Answer in two weeks. Little One.

A NAME PUZZLE.

Place five male names so as to form a sixth.

☞ Answer in two weeks. L. O.

PUZZLER ANSWERS.—Oct. 30.

Hidden Coins.—1, Ruble; 2, Rupee; 3, Pistole; 4, Crown; 5, Ducat; 6, Sovereign; 7, Mill; 8, Groat; 9, Guinea; 10, Pound; 11, Pistareen; 12, Sesterce; 13, Carlin; 14, Bank-note; 15, Greenback; 16, Thaler; 17, Levy; 18, Bullion; 19, Coupon; 20, Napoleon; 21, Guilder; 22, Florin; 23, Real; 24, Rixdollar; 25, Pence.

Name Puzzle.—Celestine, Hettie, Rachel, Inez, Salome, Thomasine, Ida, Adelia, Nell, Aurora. Initials form "Christiana."

Acrostical Enigma.—Annie L. Jack.

Sabbath Reading.

MORNING.

LAURA S. HAGNER.

Oh, mystery of morn,
So stainless and so fair!
Thy birth should wake the world
To penitence and prayer.

Each day is a reprieve
To erring, sinful man,
And angel spirits grieve
To view the wasted span.

What griefs may hidden lie,
In ambush 'mid the hours;
What blessings in that Summer sky,
To fall like Summer showers!

Father! our hearts prepare,
For all Thy love may send:
Help us to serve Thee day by day,
And trust Thee to the end.

THE LIVING CHRIST.

The picture of Jesus Christ could never have been drawn had there not been a living Christ from which to draw it. The life, character, the teachings of Christ could never have been written by mortal men, if that life had not first been witnessed, if that character had not been seen, if those teachings had not been heard. If this is so, then the simple existence of these books is sufficient proof of their historic truth; for the reason that what they describe is beyond human invention. Here is the marvellous picture. Here are the books. They must in some way be accounted for. No respectable scholar denies that they have been in the world from the earliest Christian age. Either Jesus Christ lived, and this is a natural record of his real life, or somebody of that age invented it.

Now, for four unknown and unlettered men to conceive of such a character as that, to actually set him in motion, with all the graces and virtues of an inimitable and noble manhood, to supply wisdom for him, to furnish him with the strength and loveliness of Jesus Christ, to carry through consistently a being making such stupendous claims, to make that airy fiction the source from which stream all our best thoughts of God, and to make him, at the same time, a real brother man, so real that we clasp him as our own flesh and blood—for four unknown men, I say, to have risen in the darkness of the old Roman world and done that, is a miracle of *authorship* which surpasses any miracle of the New Testament. The character of Jesus is the supreme miracle. It is far easier for me to believe that Jesus Christ came down from heaven, as these men say he did, than to believe that they manufactured him.—Dr. Mitchell, in Chicago Standard.

The cross of Jesus summons the whole race to the Father's house. "They shall come from the east and from the west, and from the north and from the south, and shall sit down in the kingdom of God." If I be lifted up, I will draw all men unto me," If the mission of Christ was for all men, the mission of the church is to all men, for her function is to carry out the purposes of the Master: her duty co-extensive with the sphere of His work; her glory the fulfillment of His. Christ did not feel that the wants of Jerusalem, and the test of Israel, justified a neglect of Ethiopia or Parthia, Macedonia and Rome. We have no right to love and live in a land less broad, or limit our sympathies to a brotherhood less universal.—Wayland Hoyt.

Which?—The inquiry often made, "Which is the most important, pulpit labor or pastoral labor?" is like the query, "Which of the two blades of a pair of scissors is the more important?" We should answer, "*Both.*" The man who visits, and does not prepare for the pulpit by diligent study; the man who preaches and does not visit, either of them will find his usefulness, we will not say paralyzed, but very greatly abridged. If a man studies with the condition of his people in view, he will study to ten-fold advantage; if he visits with his pulpit in view, he will visit to ten-fold advantage. We may add that no minister can afford to lose the benefit to his own mind and heart. Many of the best sermons are born of a visit to the bed side of some aged saint, to the kitchen of some plain toiling woman, or to the workshop of the mechanic.—Nat. Baptist.

The maxim that knowledge is power is true only where knowledge is the main thing wanted. There are higher things than knowledge in the world—there are living energies; and in the moral world, certainly, it is not knowledge, but aspiration, that is the moving power; and the wing of aspiration is prayer. Where aspiration is wanting, the soul creeps; it cannot fly; it is at best a caged bird, curiously busy in counting and classifying the bars of its own confinement.—J. S. Blackie.

Sanctified afflictions are among the most precious blessings of the Christian's present lot:—patience and submission to God's holy will, are thus brought out and strengthened, and he is eminently glorified.

Let it not be imagined that the life of a good Christian must necessarily be a life of melancholy and gloominess; for he only resigns some pleasures to enjoy others infinitely better.—*Pascal.*

How often, having spent our strength over material things, we bring to the cause of Christ jaded bodies and wearied minds. We need a consecrated enthusiasm in the doing of God's work.

PERSONAL ITEMS.

Bismarck has for many years believed that he will die in 1891.

Ex-Governor Seymour was so sick that he could not vote on election day.

Mr. English says it isn't such an awfully salt river, but that it is extremely brackish.

Ex-King Amadeus is now on a tour in England, buying up horses for the royal stables of Italy.

It is rumored in army circles in Washington that Gen. Miles will succeed Gen. Ord, who, it is believed, will be retired.

The Viceroy of Ireland receives $100,000 a year and "allowances," but loses money because of the hospitality he must give.

M. Gambetta has purchased a site for his tomb at Pere la Chaise, opposite the mouument of M. Thiers, and he has paid for his last abode the sum of 150,000 francs.

President-elect Garfield is a member of Pentalpha Lodge, No. 23. Columbia Chapter, No. 1, and Columbia Commadery, No. 2, of the Masonic Order in Washington.

General Grant says that the man who did most toward the republican victory was Wade Hampton; and that President-elect Garfield ought to make him Secretary of war.

The Earl of Cawdor and party, numbering six guns, recently succeeded in bagging the extraordinary number of 596 hares in one day. Gamekeepers and gillies were, of course, unable to carry them, and they were conveyed to the castle in carts.

Charles Dudley Warner, having much newspaper work to do, devotes only his Saturdays to magazine and book writing. He was born in Massachusetts and is 51 years old. His thick hair and beard are gray, but he appears young. He is of medium hight, and grave, thoughtful and refined.

[Daily Chicago Times.]

Mr. George Barnes, of Bagnall & Barnes, South Water street, said that his wife had been a severe sufferer with neuralgia for years and had tried many remedies in vain. St. Jacobs Oil is the only thing that brought her relief.

KIDNEY-WORT

The Only Remedy

That Acts at the Same Time on

The Liver, The Bowels and The Kidneys

This combined action gives it wonderful power to cure all diseases.

Why Are We Sick?

Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.

KIDNEY-WORT WILL CURE

Biliousness, Piles, Constipation, Kidney Complaints and Diseases, Weaknesses and Nervous Disorders,

by causing free action of these organs and restoring their power to throw off disease.

Why Suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?
Why have sleepless nights?

Use **KIDNEY WORT** *and rejoice in health. It is a dry, vegetable compound and* **One package will make six qts of Medicine.** *Get it of your Druggist, he will order it for you. Price,* $1.00.

WELLS, RICHARDSON & CO., Proprietors,
(Will send post paid.) **Burlington, Vt.**

Liquid KIDNEY-WORT

In response to the urgent requests of great numbers of people who prefer to purchase a Kidney-Wort already prepared, the proprietors of this celebrated remedy now prepare it in liquid form as well as dry. It is very concentrated, is put up in large bottles, and is equally efficient as that put up dry in tin cans. It saves the necessity of preparing, is always ready, and is more easily taken by most people. Price, $1 per bottle.

LIQUID AND DRY SOLD BY DRUGGISTS.

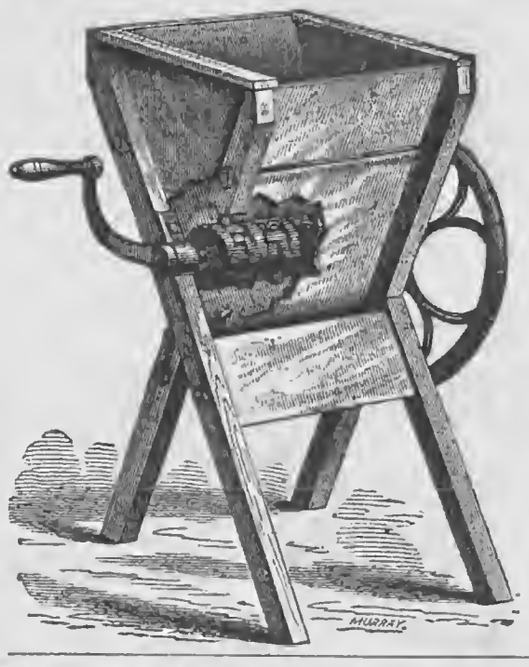
CLARK'S IMPROVED ROOT CUTTER



PERFECTION OBTAINED IN

CUTTING ROOTS

This Cutter has *received* the First Premiums *at every Fair,* and has no *equal.* Do not fail to examine it.

The Neatest, Strongest, Simplest, Cheapest, and most Perfect Root Cutter in the Market.

This Cutter is built with a heavy oak frame, well bolted together; is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of *twenty-five steel knives* (gouge shaped), so arranged on a wrought-iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are neatly cut in pieces suitable for feeding. No coarse, ungainly pieces are left by this Cutter. A boy can easily cut 35 to 40 bushels per hour, so easily does it do its work. ☞ Don't fail to examine it. ☜

We are manufacturing three sizes, designated by numbers,—1, 2 and 3.

Nos. 1 and 2 designed for hand use.

No. 3 is the Power Cutter, and will cut 100 bushels per hour.

NEW PREMIUM CORN SHELLER.

ONLY $1

Sent by mail postpaid on receipt of price.

Cannot get out of order. Will last a lifetime.

This is the only Cheap Practical Hand Corn Sheller in the market and is in every way the

BEST HAND CORN SHELLER EVER INVENTED.

Shells 25 to 30 bushels a day **very easily.** Is especially recommended to farmers who shell large quantities of corn for seed. It has been customary to remove the imperfect kernels from both ends of the ear with the hand, and use the full, perfect kernels of the center for seed. This is a long, tedious process, but with this sheller it can be done in one-tenth the time. To poultrymen, to seedsmen and to anybody who shells corn, we recommend it. Can be carried in the pocket and samples of corn taken from any part of the field by shelling only part of an ear.

Our PREMIUM CORN SHELLER is destined to become the **Leading Hand Corn Sheller** of the day, and you will find it profitable and to your advantage to secure the sale of it. When it is once introduced no other small sheller will be wanted in your locality. This Sheller opens a new field for reliable agents. A very profitable business can be done upon a small capital.

Believing this to be the Best Low Priced Corn Sheller ever invented we have secured the General Agency for the United States, and we want

CANVASSING AND LOCAL AGENTS IN EVERY COUNTY.

Sample sheller and price list sent prepaid to any address upon receipt of $1.

Address all orders to Publishers of

Humorous.

A WAG suggested that a suitable opening for many choirs would be, "Oh, Lord, have mercy on us miserable singers."

A KANSAS paper ends a marriage notice: "The couple left for the East on the night train where they will reside."

MISTRESS—"Bridget, did you hear me call?" "Yis, mum," said Bridget, "but you tould me the other day never to answer ye back and I didn't."

MAMMA—"Why, my dear Willie, what in the world is the matter with little Oscar's head?" Willie—"Well, we're playin' 'William Tell,' an' somehow my arrow won't hit the apple, but keeps pluggin' his eyes an' nose."

"'PEARS to me your mill goes awful slow," said an impatient farmer boy to a miller. "I could eat that meal faster'n you grind it." "How long do you think you could do it, my lad?" quoth the miller. "Till I starved to death," answered the boy.

A GUEST at a fashionable hotel took his seat at the dinner table, but no one appearing to wait upon him he remarked, "Have you any waiters in this hotel?" "Yes," responded a wag on the opposite side of the table; "the boarders are the waiters."

Lay in a Stock of Vigor.

Bodily decay is greatly hastened by causes scarcely perceptible in the beginning, but which prey upon and undermine the constitution proportionately to the degree of neglect with which they are disregarded. A diminution of vital energy, the proximate cause of which is a failing of digestive power, is dangerously subversive of regularity in every function of the body. To lay in a stock of vigor is the only philosophic way to restore health on a permanent basis. The Nation's favorite tonic, Hostetter's Stomach Bitters, is specially adapted to the use of debilitated invalids, whose stomachs fail in duty, or whose liver or bowels are inactive. A steadily pursued course of this regulating invigorant, protects those wise enough to adopt it from the consequences sure to ensue from a disregard of the causes of failing strength. The Bitters moreover, not only enriches the blood, but purifies it.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXIX. No. 47. WHOLE No. 1608. | NEW YORK, NOV. 20, 1880. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Arboricultural.

THE CUT-LEAVED BEECH.
Fagus Sylvatica Heterophylla.

If the elm is, according to Loudon, the most magnificent vegetable of the temperate zone, the beech is at least the most magnificent shade tree. England glories in her Burnham Beeches, her beeches at Windsor and her beeches on many an old estate throughout the kingdom. America is also equally proud of her beeches on the few lawns she possesses that are worthy of the name. The European beech is not common on the lawns in America. Nor do we often see an American beech except as it may be a remnant of former native plantations. The richly-colored Purple Beech is still more uncommon, and the Weeping and Cut-leaved Beeches are only to be seen at rare intervals.

By what name shall we call the Cut-leaved Beech? It is fern-leaved or cut-leaved—asplenifolia or heterophylla—likewise laciniata, quercifolia, incisa and dissecta. Cristata and castanifolia are similar and yet different. For that matter, they are all different. The very leaves on the same tree are different, as may be seen by our illustrations, which represent distinct foliage taken from one specimen. The existence of this strongly marked characteristic has induced us to employ the name Heterophylla, or, as it may be translated, leaves with no regular form.

Cut-leaved Beeches are slow of growth, hardy and not easily transplanted unless they have fibrous roots in abundance. It is a fact not generally known that beeches, as well as magnolias, are among the most difficult of deciduous trees to move. The Cut-leaved Beech is no exception to this rule. When the disgusted planter gazes on the lifeless remains of his Purple or Cut-leaved Beech which he set out in the Spring with many precautions, and feels disposed to blame the nurseryman, let him first endeavor to recall whether he did not do the unpacked tree injustice by allowing its roots to remain unprotected under the pitiless stress of sun and wind at least one-half hour before he set it out. Or, perhaps, he has knowingly bought a plant with poor roots and other inferior qualities at a correspondingly low price. We see such lack of common sense and ordinary knowledge displayed from time to time that no loss of trees in transplanting should be considered strange, unless it is positively known that every precaution has been taken and the best of plants employed.

As an ornamental tree, many consider the Cut-leaved Beech almost unsurpassed. Some distinctly place it among the best half-dozen lawn trees. Its special and distinctive charm lies in the airy outline of its foliage. Perfect pyramidal symmetry might seem at first its distinguishing attraction. If you will consider, however, more carefully the minutely waving nature of the young and narrowly divided leaves of its otherwise regular contour, I believe that you will agree that the varied delicacy of its airy outline makes, after all, its principal attraction.

One of the best instances of topiary work to be seen in this country is on Mr. H. W. Sargent's lawn at Fishkill-on-the-Hudson. It is a Cut-leaved Beech some eight feet high trimmed into a perfect pyramid or truncated cone and pierced by a Gothic window on a level with the eye. The view thus revealed is a delightful little picture of rock and tree and distant mountain-side. Surprise, of course, adds greatly to the inherent charm of such a scene.

The grandest Cut-leaved or Fern-leaved Beech in North America is unquestionably the magnificent specimen that stands in front of the Redwood Library in Newport. Its proportions are colossal and the outline and spread of its branches picturesque and irregular in the highest degree. There are other large Cut-leaved Beeches in the country, twenty to twenty-five feet high and as much in diameter, but nothing like this beech of Newport.

I might justly occupy still farther space in describing the rich and varied coloring of the leaves, the strangely picturesque bark and branches, and the marked and sturdy forms of Winter nakedness, but these peculiarities, partake after all, of the general characteristics of the genus. We feel, besides, that neither pen nor pencil can do justice to the subtler qualities of a tree. Every one should see a Cut-leaved Beech, and thus learn in reality how excellent a tree it is. S. PARSONS, JR.

THE SPECIMEN from which our leaves were drawn was planted at the Rural Grounds six years ago. It is now scarcely six feet high, though the soil is fairly rich and no other tree or shrub grows near enough to interfere with its natural development. But it is just this class of trees that should be selected for small places—say from one to three acres in extent. They are always in keeping—always admit of that variety which gives to the owner hundreds of plants to see and to study, instead of limiting him to a few, as must be the case where large-growing trees are employed.

Pomological.

HORTICULTURAL IMPROVEMENT IN MICH.—OBSTACLES IN THE WAY.

T. T. LYON.

The Average Michigan Farmer

although doubtless fully as intelligent as the class generally; and, as a rule, disposed to make the orchard one of the interests of the farm, can rarely be induced to so far inform himself as to varieties and management as to become qualified to decide and act wisely for himself. As a consequence, his selections for planting are largely the result of accident; or of the advice of the nurseryman or "peddler" who may have an interest in his choice. Hence, conservative and slow though he may be, he too often becomes the victim of sharpers and even swindlers and is not unfrequently imposed upon with wonderful and even impossible fruits; such as tree strawberries; hybrids of the plum and the grape; apples without cores; Utah hybrid cherries; curculio-proof plums etc., etc., generally at prices as fabulous as the alleged qualities of the fruits palmed upon him. Occasionally a would-be progressive farmer ventures upon what may be termed a hybrid between farm and orchard, making commercial fruit growing a sort of adjunct of the family orchard. In such case, it is too often true that the slow farmer's idea, that "a tree can take care of itself" is acted out in the treatment of the orchard, which, as a very natural if not inevitable result, becomes a practical and (in all probability) a pecuniary failure. Somewhat extended observation would seem to indicate that, as a rule, where the two are combined, the management of the orchard is rarely kept up to the highest point of efficiency and profit; and that, in case of neglect of either, the orchard is quite sure to be the first to suffer.

Commercial Orchardists,

who may be assumed to have the best possible inducements for intelligent and considerate practice, are by no means always up to the standard requisite for intelligent and successful results; but are too often inclined to accept their information, as well as their practice, at second hand. One of their most noticeable failings, as a class, may be assumed to be a tendency to look too closely to immediate results—a disposition doubtless too common among all classes; but one which applies much less profitably to the orchard

DISSIMILAR OR CUT-LEAVED BEECH.—Fagus Heterophylla.—Fig. 372.

than to most other agricultural pursuits. A very natural sequence to this tendency is, that it is comparatively difficult to introduce a promising novelty, even for trial, the disposition being to wait till some one else shall have demonstrated its value; instead of testing it for themselves, and thus becoming informed of its real value in time to be able to adopt promptly, whatever shall prove worthy of adoption for their purposes.

Farm Orchards

are needed for a distinct purpose; and hence the varieties selected for such purpose should be chosen for their fitness for the same. The commercial idea calls for good handlers, bright-colored and productive, with but slight regard to mere quality; while the wants of the family demand fine quality, delicacy, and other minor particulars by preference. Unfortunately the preponderance of the "market idea" among both nurserymen and planters is often so decided that family requirements are in a measure crowded aside. Indeed, it is not unfrequently true that nurseries fail, in whole or part, to propagate and offer for sale many of the very finest of even the old, well recognized varieties; while newer sorts, no matter how desirable, are only taken up when necessary to meet a pressing demand.

The Tardy Introduction of Novelties

in Michigan, is doubtless largely due to the causes already stated; but it is believed that the very superiority of our climate, for such pursuits, may have much to do with the matter. The almost universal success, here, of varieties popular at the East, coupled with the fact that both our people and our orchards have been imported very largely from that direction, has almost wholly determined our selections; and although the pomologists of the more westerly States have, under the stimulus of a necessity peculiar to their region, been long engaged in the creation of a class of fruits adapted to local needs; they have been in the main outside of our line of supply; while our planters have doubtless acted upon the idea that, in their case, quality was being subordinated to hardiness; so that we here must expect to lose rather than gain by the introduction of these new creations, since the old well known and thoroughly recognized sorts, already among us, are abundantly satisfactory, so far as hardiness is concerned. It is beyond doubt true that the alleged tendency of market varieties to override, or crowd aside those more especially of an amateur character, is increased by the circumstance that many if not most of the finest of amateur varieties are of feeble or otherwise unsatisfactory habit; and hence less acceptable to both the nurseryman and the orchardist; while few purchasers are found willing to pay for the increased expense or time requisite for their production.

Farm Economy.

WHICH FORM OF NITROGEN IS MOST READILY ASSIMILATED BY PLANTS?

No. 2.

PROFESSOR F. H. STORER.

From the evidence of the experiments noted in my last article it is difficult to escape the conviction that the corn plant needs ammonia (or urea?) when young and nitrates when more mature. It is to be remarked that these results agree closely with those obtained by Stohman in his earliest experiments with corn. His plants grew best in solutions that contained both nitrates and ammonia. The significance of this fact is seen now more clearly than it was at the time the experiment was made, for attention was distracted from it by subsequent experiments of Stohman and others in which it was found that corn could apparently be grown in the absence of ammonia. Lehmann's results are in full accord also with Kuehn's experiments made in 1866. Several experiments upon corn made by Hampe, and repeated by Wagner, show also that this plant can use ammonia (as well as urea and uric acid) in the earlier stages of its growth, and from the record of these trials it seems probable that the plants got an abundance of nitrates, in due course, from the oxidation of the ammonia in the solutions. Taken all together, the experiments go to show that ammonia alone is insufficient for the growth of corn; that nitrates are needed by the more mature plant; and that mixtures of ammonia and nitrates may fitly be used for fertilizing this crop.

Lehmann experimented with tobacco also, in a similar sense, though in this case he grew the plants not by way of water-culture, but in sand to which all the necessary kinds of food had been added. To some of the plants he gave nitrate of soda and to others sulphate of ammonia. The tobacco plants fed with the ammonium salt were healthy and sound from first to last, and the plants grew normally all the while. The nitrate-plants remained far behind the others during the first half of the experiment and had a pale color and sickly appearance; but during the last half of the experiment they manifested a strong tendency to improve. They became green and their growth was evidently stronger than before, though in spite of this improvement, the final weight of the nitrate-plants was comparatively small. The intimation given by these trials that ammonia may be better food than the nitrates for tobacco is all the more surprising inasmuch as tobacco is one of the plants that is apt to take up nitrates freely from the soil and store them in its leaves. Like the mature corn-plant, the tobacco in these experiments evidently fed upon nitrates during the later stages of growth, and it is in the highest degree probable that even in the jars which contained ammonia, nitrates were really formed during the second period. Since the plants were grown in sand, in this case, it was impossible to prevent the formation of nitrates, as had been done for the corn-plants, by frequently changing the solution.

Lehmann grew lupins also, and it appeared that nitrate of soda was on the whole better fitted to feed these plants than sulphate of ammonia. His experiments, as regards lupins, have recently been repeated by Wein who finds that, in spite of the fact noticed by Lehmann also, that this plant stands in comparatively little need of nitrogenous manuring anyway, the use of nitrate of soda is, nevertheless, advantageous on the whole, while sulphate of ammonia seems to be actually hurtful. Heiden also has offered evidence to show that sulphate of ammonia is of no use to lupins, not even in the earlier stages of growth, and that rye does not feed upon ammonia directly. In field experiments upon rye manured with sulphate of ammonia the plants were miserable until the end of April when they began to grow luxuriantly. Meanwhile the soil had been tested from time to time for nitrates and none had been found until the end of April. From that time forth they were found in abundance. The fact that sulphate of ammonia has been found so useful as an application to grain in England is readily explained by the supposition that it gradually changes to a nitrate in the soil.

Lucanus found in laboratory experiments that nitrates were absolutely necessary for the luxuriant growth of his clover-plants, and Dr. Gilbert has called attention to the fact that in the field experiments of Dr. Lawes and himself, nitrate of soda has been found to act much more favorably than sulphate of ammonia upon the growth of leguminous plants, such as peas, beans, and clover.

The upshot of the experiments seems to be that while there are some plants which feed upon nitrates during their whole life, other plants can only use nitrates freely after they have reached a certain development; and that while there are some plants which are benefited by ammonia when young, there are other kinds which get no good from it even in the earlier stages of growth. These results of laboratory experiments are manifestly in accord with the facts well known to farmers, that some crops, like Indian corn, for example, will succeed well on land that has just been dressed with fresh stable manure, while other crops had better always be manured with well-rotted dung. Furthermore, they go to show the utility, suggested long ago by Stoeckhardt, of using mixtures of nitrogenous fertilizers, in many cases. A mixture of a small quantity of nitrate of soda—or of sulphate of ammonia, in the cases where ammonia salts are to be preferred, to act in the earlier stages of growth—together with a quantity of nitrogenized organic matter to be nitrified in the later stages of growth—may often be a more economical method of manuring than either one of the ingredients taken by itself. It is not improbable that mixtures of sulphate of ammonia and nitrate of soda would do better service in many cases than either of these salts by itself. It was noticed some years since in the laboratory experiments of Birner & Lucanus that while healthy oat plants could not be grown in the absence of nitrates it was still true that better plants were got by using both sulphate of ammonia and nitrate of lime than when only the nitrate was employed. It is to be noted in this connection that more or less of ammonia compounds, and usually some nitrates also, are contained in growing plants at all the different stages of their development, the ammonia compounds, moreover, are commonly present in plants in larger quantity than the nitrates are. It would seem as if each of the two substances had some special physiological function to perform within the plant, and as if it would be well to provide the plant with both of them.

The noted experiments of Hellriegel on the growth of barley-plants, showed that barley succeeds perfectly when fed with nitrates, but does not succeed when fed with ammonium compounds, under conditions which preclude nitrification. More recently Haesselbarth has confirmed this result. He finds that barley grows perfectly well when fed with nitrates, and also when it is manured with ammonium salts provided the soil is marled, *i. e.*, it succeeds when the conditions are made favorable for changing the ammonia to a nitrate. In both cases his plants took up almost the whole of the nitrogen that was contained in the fertilizers offered to them, and the weights of the dried crops were very nearly equal. But in the absence of marl only about half of the nitrogen contained in the ammonium salts was taken up by the plants and the dried crop only weighed a third as much as the others. These remarks apply both to sulphate of ammonia and to chloride of ammonium, but not to phosphate of ammonia, which gave exceptionally bad results. Only three-fifths of its nitrogen were consumed by the plants grown in the marled earth and only one-seventh by those where no marl was used, and the weights of the crops were correspondingly low. It was determined, moreover, by special trials that a large portion of the ammonia compounds in the marled earth did actually change to nitrates during the course of the experiment.

THE VALUE OF A CARRIAGE-BOLT AND A RIVET.

A CARRIAGE-BOLT is an iron bolt with a broad head at one end and a screw and nut at the other. It is to be procured of all sizes, from one-eighth of an inch thick up to one inch. Its form is as here shown. It costs, in quantity, not much more than cut nails, and its value consists chiefly in the fact that it can never, practically, be used up. For if used in making a gate, for instance, when the gate is worn out, or banged to pieces by neglect, as is the usual fate of a gate, the bolts may be taken out and used for another gate, and so on as

FIG. 373.

long as a man may live, and his children may use them after him. But a nail's life is ended when it is once used, and this fact may have given rise to the adage, whose origin is supposed to be shrouded in mystery, "as dead as a door-nail." For use on the farm there are few more convenient and useful things than these bolts. For putting together wagon-boxes, hay-racks, feed-racks, gates, doors, portable fences, and for putting hinges on, as well as for repairing almost every wooden thing of large size and heavy weight, carriage-bolts are indispensable. A gate put together with carriage-bolts will out-last a dozen made with nails; a door fastening put on with a bolt is safe and permanent, and so is a hinge, and they are cheap. In short, when one has used a few bolts and found their value, he will never be without them. The neck is made square, so that it will not turn in any hole into which it is driven.

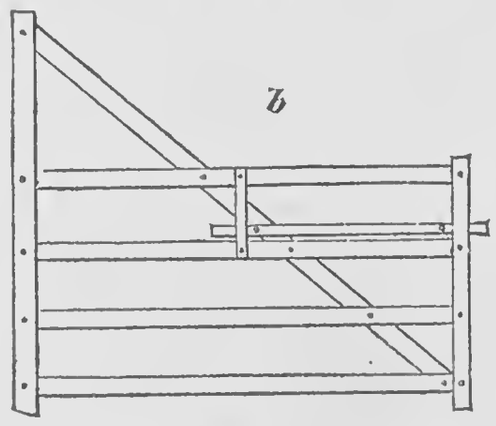

FIG. 374.

At fig. 374 is a yard-gate made with fence-boards put together with carriage-bolts. Any one can make it and put on the hinges and hang it in one hour. To do this, take a piece of fence-board nine feet long and one foot and a half feet; lay these on a barn floor or on a level piece of ground. On these lay the four bars, 12 feet long; square them with a square and lay the brace on them as shown. With a quarter-inch bit and a brace bore the holes as shown in the illustration and put the bolts through them. Then lay over the cross-bars a second upright for the head-post and another for the foot-post; mark these and bore them and put them in place. The bolts should be three and three-fourths inches long if the fence strips are "plump inch;" if they are "scant inch" three and a half inches will be long enough and three-sixteenths of an inch thick will be strong enough. Put a washer over each bolt under the nut, and screw up the nuts. Put one hinge on the gate at the lowest bar, to which it should be bolted, and the upper hinge should reach from the head-post to the brace near the top. The result will be a gate of the cheapest construction, light, strong, and one that cannot sag. A slide-bolt may be made to work between the foot-boards and between the brace, and a short, upright piece which is bolted to the bars, as shown. Two pegs in the slide-bolt prevent it from going too far in either direction. This is but one example of many in which light carriage-bolts may be made useful.

A copper rivet and a burr are the best things to repair broken harness with. They will be found useful for making straps, for repairing iron hoops and for many other useful purposes. But for fixing harness they are invaluable. To mend a trace, for instance, a hole, or two or three of them, may be made in the leather with a small blade of a penknife, a gimlet, or, which is best, with a punch, for the special purpose. A small, sharp knife-blade, twisted around in the leather, will cut a smooth hole. The rivet is inserted from the inside of the trace, the burr is placed over the end, and a few blows rightly directed will fasten the rivet permanently. It will not break or wear out. The hammer blows should be struck a little sidewise, so as to make a conical spread of the rivet, and not directly upon the end of it. The effect of this is shown in the drawing. A roll of copper wire is also a handy thing to have about a barn; for with it one may splice a cracked shaft, mend the handle of a tool, repair a broken cradle-finger, sew harness, and even fasten a button on to his clothes. For the last-mentioned purpose nothing else is so easy, ready or effective.

Care of Farm Implements.

We often see, when passing along a country highway, mowing machines, hay rakes, wagons and other farming utensils lying out exposed to the weather. Sometimes this is because the owner has no convenient place for them, and at other times it is through negligence, but whatever the cause it is always poor economy. The value of implements and machines necessary to use in the proper and successful management of an ordinary-sized farm, amounts to about $500, and the wear and tear of them is of necessity a great deal; but if allowed to remain out in all kinds of weather they will often receive more detriment from the exposure than from actual use. The implements used on an ordinary-sized farm can all be stored easily in a building 30x40 feet, the cost of which need be but little, not to exceed $50. A little thought and computation will show to any farmer the advantage of such a building for storing farm implements. But a building, however well-built, will not protect from the weather, implements that are left in the field. We must exercise some care in keeping them in their places. G. A. Goff, Jr.

Field Crops.

MORE TESTIMONY CONCERNING THE WHITE ELEPHANT.

The White Elephant Potato I believe to be an excellent variety as to productiveness, quality and time of maturing, being a medium late, which is also a great consideration, as they can be housed for Winter use much earlier than the late varieties, thus freeing the land for Fall seeding or other purposes. Having so few to start with, I cut them to one eye to make them go as far as possible, and planted in the same field with the Beauty of Hebron, giving both the same treatment. The early season was very dry here and affected the Beauties and Roses very much, but the Elephants, being strong growers, did not suffer so much and turned out a much larger yield of good, salable tubers. Of course, the trial this season in this locality was not a fair one, but I saw enough to convince me that they are a No. 1 potato for a general late crop. The Elephant is a good cooking, salable, well-shaped potato. I shall plant more of them next season.

Bay Ridge, L. I. David C. Bennett.

The members of my family, who are good judges of potatoes, pronounce the White Elephant as good as the Early Rose. It is large and productive. W. J. Beal.

State Agricultural College, Lansing, Mich.

The specimen tuber of the "White Elephant" sent to the President of the College was turned over to me for planting. I cut the potato to single eyes and planted them in my specimen beds along with other kinds, but the season proved so dry that potatoes of all kinds were with me a failure. I have saved the few fair tubers gathered for what I hope will be a more satisfactory test next year.

E. A. Popenoe.

State Agricultural College, Horticultural Department, Manhattan, Kansas.

The White Elephant Potato I think an excellent variety. It matures early, grows to a good size, is prolific so far as tried, and when cooked is mealy and of fine taste or flavor. I raised enough from half of the one you sent

me to plant a hundred (100) hills or more, and should it keep well this Winter, I promise myself a nice crop next Summer.

B. L. ARNOLD, Pres.
State Agricultural College, Corvallis, Oregon.

REPORT UPON CHESTER COUNTY MAMMOTH CORN ON THE RURAL FARM.

NEW YORK, Oct. 23, 1880.

ED. RURAL:—Upon the same day—Oct. 12,—upon which we measured the field of Blount's Corn we also examined a field of yours containing about four and a quarter acres of Chester County Mammoth Corn, yellow, and found from a measurement of one acre the yield to be 236 bushel baskets of corn on the ear per acre. This field had some appearances of a greater crop than the Dent, but we could not ascertain such to be the fact. Our measurements were as carefully made as in the former instance, but, time pressing us, we were unable to shell and weigh the net proceeds. The stooks we found not uniform in size or yield, and after counting the stooks upon an acre, we took a few measurements of distances between individual stooks as a check, and found this calculation differing somewhat. The stalks in this field mostly bore one large ear each, and the cob seeming to be large, it would appear that the yield of grains would not be so great in proportion as upon the Dent field of smaller ears. The cultivation, as we learned, was similar in both pieces, excepting that the Chester was enriched by only 350 pounds of Mapes's special fertilizer, against 500 pounds upon the Dent field.

In measuring an acre we began at a point half way between adjacent stooks upon the north and west, and found that 208 feet by 200 feet, brought us again to center lines between stooks, this area gave 41,600 feet, or .955 of an acre, and counting 52 stooks, one acre should contain 54 34 stooks of an average of 4.34 bushels, or 236 bushels of ears per acre.

LARGE YIELD OF POTATOES.

MR. N. C. JESSUP, of West Hampton, Suffolk Co., L. I., has brought to this office some very fine specimens of a large white potato known for several years past as the Burbank Seedling, of which he informs us that he has raised fully 1,000 bushels upon two acres of ground during the season just closed. The seedling is a late potato, having been planted April 25th and harvested October 1st, and very large, one of them, he says, weighing two and one-half pounds!

The ground was plowed two years previously, and the first year had a crop of rye with less than 10 bushels to the acre. The next year there were 15 000 fish applied and the ground was planted in corn, and yielded 140 bushels of ears to the acre. Upon a third part of the two acres for the potatoes there was at the rate of 18 000 fish to the acre applied. Upon another third part there were 15 loads of coarse yard manure, with about 10,000 fish. Upon another third part there were 20 loads of coarse yard manure and 400 pounds of guano applied. The yield was pretty nearly the same all over the two acres.

In planting, the potatoes were cut three eyes to a piece and dropped in the furrow some 18 inches apart, and where so manured the coarse manure was raked in and, with the potatoes, covered with the plow about four inches deep. The seed was dropped in every other furrow, leaving the rows but two feet apart. The cultivation was with a small, single mold-board plow, a single furrow, soon after the potatoes were up, and a light single furrow with a small double mold-board plow later.

At the rate of 250 pounds of muriate of potash was applied at the time of planting upon every other row over a small part, but the yield was not improved. A part of the fish was lightly plowed in upon a part of the two acres in the Fall; the rest were spread upon the top of the ground before plowing for planting in the Spring. The manner of applying the guano Mr. Jessup does not state, but the yield was the same where applied and where other manure was used. Mr. Jessup thinks that had care been used to insure perfect "seed" there would have been 50 bushels to the acre greater yield. The soil was from light to heavy sandy loam. The secret of the good yield may perhaps be found in part in having good seed potatoes, part in the nearness of the rows and the hills, and a part in the fact that the manure was applied directly where the potatoes could reach it, and still another part in the complete covering of the ground by the vines, thus keeping the ground moist, light and mellow.

A Woman's First Potato Crop.

Seeing in past numbers of the RURAL the high esteem in which the Beauty of Hebron Potato was held by some of your subscribers, I will give my experience with it this season. I obtained a small potato which weighed just three ounces. It had thirteen eyes. I cut it into pieces of one eye and I put one piece in a hill. Each hill was fertilized with a tablespoonful of superphosphate of lime, and the pieces were planted the 22nd of May. They were hoed but once and dug the 12th of September. I had a half bushel measure heaping full. Several will weigh a pound apiece. Several of my friends who saw the "seed" before planting, have also seen the product and they think it a good yield—equal to 160 bushels from one bushel of seed. Who can beat this crop this year? The "seed" came from one of your last year's subscribers.

Oneida Co., N. Y. MRS. E. R. DAVIS.

The Poultry Yard.

PREPARING POULTRY FOR MARKET

SOME of the largest poultry dealers in New York have published directions for fattening and preparing fowls for this market. The salient points in the directions are:—

Never let poultry forage and shift for themselves for at least ten days before killing them; for they are apt to range in the barnyard and pick up filthy food which defiles the entire bird, its flesh on this account frequently becoming so tainted that it is unfit for food. To make the best flesh the fowls should be constantly kept highly fed from the beginning, with plenty of clean, cold water; thus they are always ready for the table. With but very little extra attention the flesh for poultry will be juicier and richer in flavor than that of fowls fattened from a low and emaciated state, and it will always command a quick sale and the highest price. Do not "cram" a fowl before killing it to make it appear heavy. The undigested food soon begins to ferment and putrifaction takes place, injuring the sale of the bird a great deal more than is gained in weight by this dishonest practice. If allowed to remain in the coops 24 hours without food before it is killed, the bird will keep fresh longer and present a better appearance. The best food for fattening fowls, old or young, is barley meal alone or mixed with equal quantities of corn meal cooked and fed warm. A small quantity of brick-dust in the water is recommended. This will make their flesh fatter and more solid, giving it a fine golden color after being dressed.

The best mode of killing poultry, as it causes instant death without pain or disfigurement, is to suspend the birds by tying their legs firmly to a pole or heavy wire across the killing room at a convenient distance from the floor, and to open the beak and with a sharp-pointed, narrow-bladed knife make an incision at the back of the roof, which will divide the vertebræ and cause immediate death. Dry pluck the feathers and pin feathers all off neat and clean while warm, without breaking the skin; then plunge the bird into a kettle of very hot water, holding it there only long enough for the bird to "plump;" then hang it up—turkeys and chickens by the legs, and ducks and geese by the heads. Do not remove the entrails, heads or feet. (They must be drawn for the Boston market.) This mode gives the poultry a nice, buttery, golden color that attracts the eye of the epicure.

Pack only when thoroughly dry and cool (not frozen) in medium-sized, clean boxes or barrels in thoroughly cleaned and dusted rye straw, and to be extra-nice wrap every bird in clean white (not printed) paper, fold the head under its body, with the legs stretched out; lay it in the left-hand corner, back up, with its head toward the end of the box; fill the first row; then commence the second in the same way, only let the birds' heads pass up between the rumps of two adjoining ones. This makes the packing solid. In the last row reverse the order, placing the head toward the end of the box, letting the feet pass under each other; should there be space between these rows wide enough to lay in a few sidewise, do so; if not, fill it tightly with straw so the poultry cannot move. Over this layer place straw enough to prevent one layer from coming in contact with the other, and add other layers until the box is full. Great care must be taken not to break the skin; for during transportation such places turn black and injure the sale.

DUCKS.

FOR the table every one is willing to admit the duck's excellence, though the want of cleanliness in its habits meets with everybody's reprobation. As a feeder it has few equals while its feathers in the market stand high above those of the hen or turkey and only second to those of its giant companion, the goose.

Ducks are easily hatched and if properly managed they are easily raised—much more so than chickens or turkeys. Probably the worst thing for ducklings is the first thing they usually receive and that is unlimited range and water to swim in. The little things are, in a measure, nude, and should be kept in pens with dry soil floors or stone pavement that can be washed down daily. No kind of poultry will succeed on bare boards. All the water they need is best furnished by burying an old pot in the ground and laying a round piece of board on top of the water with room for the ducks to stick their heads in and fish out the corn that is put in the water. This amuses them and does no harm, while, if allowed to go off to ponds or streams, they are very liable to fall a prey to vermin in some shape, or to get their bodies wet and chilled from remaining too long in the water. Their pens must be kept clean if they are expected to thrive.

Ducks are enormous eaters. They feed not only incessantly all day, but if it is a moonlight night they will up and at it again every hour or two before morning. Owing to their voracious appetites they are considered non-paying fowls. It is generally claimed that they eat their heads off. We know of no statistics going to show how many pounds of corn it requires to make a pound of duck, but we do know that ducks are very rapid growers and have but little doubt that if penned and judiciously fed enough to make the most rapid growth, they would return a handsome profit for the food consumed. L. S. HARDIN.

POULTRY SHOWS.

THE season for poultry shows is approaching and every lover of fowls should make a point of attending at least one during the Winter. Aside from the beauty of the birds and the wonderful shapes and sizes to be seen among them, the exhibition may be made useful by enabling each to decide which variety would be best suited to his circumstances, and if the means are not at hand to indulge in a yardful of full-bloods, a few pure-bred cocks may be purchased to take the place of those at home, and in one season these will work wonders in the flock. Grading up is not only a useful but an exceedingly entertaining occupation, and one within the means of any one able to keep a half dozen hens. We append a list of poultry shows to take place this Winter.

POULTRY SHOWS, 1880-81.

VERMONT.—Windham County Poultry and Pet Stock Association, Brattleboro, Jan. 4-7, 1881. J. Henry Pratt, Secretary.

Champlain Valley Poultry Association, Burlington. Jan. 11-14, 1881.

Wide Awake Poultry Club, St. Johnsbury. Dec. 28-30, 1880. Chas. S. Hastings, Secretary.

Vermont Poultry Association at Rutland, Jan. 18-21, 1881. C. C. Pierce, Secretary, Rutland.

MASSACHUSETTS.—Southern Mass. Poultry Association, New Bedford. Jan. 6-11, 1881. Wm. P. Shephard, Fall River, Secretary.

Central Mass. Poultry Association, Worcester. Jan. 11-14, 1881. W. H. Fitton, Secretary.

NEW HAMPSHIRE.—Mascoma Poultry Association, Lebanon. Jan. 18-20, 1881. Fred. Moulton, Secretary.

INDIANA.—Northern Indiana Poultry Association, Ft. Wayne. Jan. 18-22, 1881. F. C. Barrett, Secretary.

Terra Haute Poultry and Pet Stock Company, Dec. 14-21, 1880. A. B. Salsich, Secretary.

White River Valley Poultry Association, Anderson. Dec. 23-25, 1880. R. I. Hamilton, Secretary.

NEW YORK.—Springville Poultry Association, Springville. Jan. 12-14, 1881. A. L. Twitchell, Secretary.

Union Poultry and Pet Stock Association, New Berlin. Jan. 18-21, 1881. J. H. Bell, Cor. Secretary.

Eastern New York Fanciers' Association, Troy. Jan. 5-12, 1881. Thos. H. Richardson, Secretary, Green Island.

MICHIGAN.—Saginaw Valley Poultry Association, East Saginaw. Jan. 11-14, 1881. C. T. Beaty, Secretary.

NEW JERSEY.—New Jersey State Poultry Society, Newark. Dec. 14-21, 1880. J. H. Baldwin, Secretary, East Orange.

PENNSYLVANIA.—Pottstown Poultry and Pigeon Club. Dec. 15-17, 1880. E. L. Pennypacker, Secretary.

Lancaster County Poultry Association. Jan. 14-19, 1881. J. B. Lichty, Secretary.

Poultry and Pet Stock Association, Germantown. Jan. 3-6, 1881. Samuel S. Ford, Cor. Secretary, Mt. Airy, Philadelphia.

Butler County Poultry Association, Butler, Jan. 5-7, 1881. W. T. Mechling, Secretary.

OHIO.—Cleveland Poultry, Pigeon and Pet Stock Association, Cleveland. Jan. 12-19, 1881. H. M. Sexton, Cor. Secretary.

DISTRICT OF COLUMBIA.—District of Columbia Poultry Association, Washington, D. C. Dec. 15-22, 1880. S. M. Clark, Secretary.

A Seasonable Hint.

We would suggest that now is a good time to patch up the hen house. Mend the broken hinges, roosts and nests, for there are probably plenty of them needing a slight repair. Clean out the old straw from the nests, and burn it. Gather together all the chicken coops and nail on strips wherever they are missing. Nothing gives greater delight even to the owner than order and system about the chicken premises, while in the end it greatly pays to keep things in repair and in their places. The younger members of the family should be encouraged to do this, getting a fair share in the profits of the enterprise, while by regular care the Winter through the yield of eggs will be treble what it otherwise would be if everything about the hen-house is left filthy and at sixes and sevens.

FOR WINTER LAYING hens should have warm dry quarters, but that does not mean that they should be shut up in a close room. No matter how cold the air is they should have a good sniff of it every day, and their room should be well aired also. A dry shed to dust themselves in and feed under, with an Eastern or Southern exposure to give them a sun bath, is of great value to them. With these surroundings and a regular supply of mixed feed one may reasonably look for a generous supply of eggs.

The Herdsman.

ORIGIN OF HEREFORD CATTLE.

I HAVE had frequent inquires as to this, but can only answer that in common with all other British cattle, it cannot be traced to any definite beginning as now bred, but the progenitors, at least in part, are supposed to be such as were described as far back in the course of time as the 10th century, because there was a law then in England that a compensation should be paid for injury done by one prince to another, with 100 cows and a bull of white color with red ears. Speed records that Maud de Brehos, in order to appease King John, who was highly incensed against her husband, made a present to his queen of 400 cows from Brecknockshire, "all white with red ears." Now as pure Herefords of the present day occasionally crop out of this color, it is thought with good reason, that the above cattle might have been among the early progenitors of them.

Mr. Thomas Duckham, editor of the English Hereford Herd Book, says that Lord Scudmore, who died in 1671, introduced red cows with a white face from Flanders. These were bred to the white cows with red ears, and produced those of the various colors of our times. The present fashion is a white face with a red body, but I believe a lined back is also admissible, together with more or less white on the throat, breast and belly. I believe, also, if a few white patches occur on the body the animal is not put aside in consequence of these. I have seen Herefords of rich strawberry roan color, also pure red, excepting a mottled (speckled) face.

A. B. ALLEN.

NOTES BY A STOCKMAN.

IT is something unusual at this time to find a man of sufficient intelligence to write a readable communication to an agricultural journal, that professes to believe in the "signs." A correspondent who has written some valuable articles about sheep in the Ohio Farmer recently declared "that on reference to his diary he found his lambs bleated more when weaned with the 'sign' somewhere in the vitals, than when it was elsewhere." This reference to the vitals may be a sly and sarcastic hit at a popular delusion; doubtless a weaned lamb would find a sign of discomfort in the vitals from an empty belly, and might reasonably bleat more on that account. Is this what Mr. Stephen Powers would have us to understand?

Cincinnati is becoming a very extensive sheep market. The receipts of that city have increased from 181 673 in 1873 to very nearly 500,000 in 1879. This is fortunate for the Southern sheep interest, which is thus provided with an outlet that promises to reach grand proportions. There is no more promising field for this industry than the mountain region of the South as well as parts of the lowland region. The opening of a new railroad from Cincinnati into the heart of this southern region offers an excellent market for sheep and lambs and nothing prevents the home manufacture of wool but the want of the raw material.

The Fall sales of Cotswold sheep in Kentucky have been unusually successful. In the magnificent pastures of that State this breed develops all the excellencies which mark its larger compeer the Short-horn. The Short-horn and the Cotswold are well suited for companions, and in the rich, broad, park-like fields of the blue-grass region, both reach their highest excellence; and as a consequence bring their highest prices. At these sales, rams brought from $50 to $225 per head; a flock of 55 head brought $3 070. Elsewhere this breed seems to be losing ground. Without the most luxurious pastures and the most skillful feeding, neither the carcass nor the wool reaches perfection. It is not in place on small farms any more than Short-horn cattle would be, and farmers who have not the requisite facilities for keeping them are dis-

appointed in the results. Purchasers for the market do not look with favor upon the mutton of Cotswold, and as mutton is the chief end of a sheep, a breed that is not productive of superior mutton can never be popular among farmers who look to the markets for the disposal of their surplus stock. Yet this fine sheep has a large place to fill in the world. For crossing on the common grade Merino it cannot be surpassed; and while it is in demand for crossing there must be business for breeders. And Kentucky has proved itself to be remarkably well adapted for breeding fine stock of all kinds.

The headquarters of the largest breeders of Short-horns are in Kentucky. The grazing farm of Mr. George Hamilton, near Mount Sterling, keeps 250 cows and heifers, all high-bred and members of the first families. A combination of the Hamilton family own, in all, about 700 head. The reputation of Kentucky stock has been well earned by careful breeding and persistence and perseverance in keeping to well chosen families. One of the oldest breeders in that State, Mr. Abram Renick, who may be called the father of Short-horn breeders, keeps only one family, the Rose of Sharons, of which he has now 65 females and all are descended from one cow bred by Mr. Bates, the noted English breeder. How rare is this quality of perseverance! And yet it is a key to success in any enterprise, and much more in agriculture, in which one has to wait longer for results than in any other. What farmer sticks to one plan, one method, one kind of stock or, in many cases, even to one farm, for a dozen years. This constant change is the vice of our system, or rather of our want of system. And failure, or at least indifferent success, and grumbling are the consequences. Farmers should learn that success in keeping stock comes from within the herd or flock and not from without. No one can make a mark who is ever changing his breeding animals, for he cannot stamp any certain character on his stock, and he cannot improve.

The great bugbear of farmers in this business is close breeding. A farmer who was discussing this question with me recently, seemed to think what he called incestuous breeding of animals was a crime, an unnatural and reprehensible proceeding. He had never heard or known how our best stock has been bred, and how closely the most successful breeders have kept to one blood. Mr. Bates never hesitated to use the same bull on mother, daughter and granddaughter, when the animal suited him, This was his great principle in breeding, and he once remarked that "it was by keeping to this rule that *his success had been entirely due.*" Now no man can hope to improve his stock except by the use of superior males; for it is from these only that improvements come. It is impossible to change one's breeding animal every year; this is perhaps a fortunate thing for the second or third cross of a good pure-bred male upon the progeny of a fairly good but common-bred female must improve the cross each time. There are two things that should be done by farmers; there may be more, but these are indispensable; these are, to study the principles and history of breeding; then choose good and suitable stock for the purpose and stick to it, improving it as skillfully as they may. This is important because it is from improved stock first, and then better feeding that the improved system of agriculture that is needed must start.

Dairy Husbandry.

THE DAIRY COW. NO 16.

HENRY STEWART.

Construction and Use of Ice-Houses.

Ice will retain the solid form for a long period if kept in a perfectly well-constructed house. The principles of construction upon which the effectiveness of an ice-house depend are: non-conductibility of the walls; perfect drainage at the foundation; perfect sealing of the floor and the drains against the entrance of air; sufficient protection from rain and air at the top; and ample ventilation in the upper covering. With all these secured the material and the form of the building are secondary considerations.

Some years ago a friend who had a Summer residence on the border of one of the picturesque lakes which abound in the upper peninsula of Northern Michigan requested me to build and fill an ice-house for him, for a supply of ice for his family in the coming Summer. I performed this commission and, as it turned out to be the best ice-house I have constructed at any time, I will describe it here. The house was 24 feet by 18, outside measure; the outside wall was made of diagonal boarding covered with dressed weather-boarding, six inches wide, laid over paper sheathing. The studding was of 2x4-inch stuff. An inner wall of common boarding laid horizontally was built 12 inches from the outer wall, and the studs of both walls were kept from spreading by numerous pieces of hoop-iron securely nailed to the opposite studs. This space was filled with fine refuse charcoal (braize) from charcoal kilns at an adjacent iron furnace. The roof was of common pine shingles laid upon tight boarding and open around the eaves for the thickness of the rafters. The roof projected three feet at the eaves. The foundation was dug out three feet, the earth being a dry, porous gravel that needed no artificial draining. The ice was of the best kind, being two feet thick, clear and free from snow, such ice being quite common in that severe northern climate, where the mercury sometimes stays many degrees below zero for weeks and often sinks into the bulb of the thermometer, or to 32° below zero. It was packed closely in square blocks and a space of 18 inches was left around it, which was packed closely with leaves, raked up in the woods before the snow fell, for several feet, and the rest was packed with sawdust. The house was 14 feet from sill to plate and the ice was packed from the floor, which consisted of two feet of sawdust, to within two feet of the eaves, and covered with from two to three feet of sawdust. Several small holes were cut in the form of stars in the front and rear gables. The house was filled in very cold, dry weather, and as soon as filled the double doorway, which was made of strips of matched boards placed crosswise, was filled with sawdust. Three outside doors, one above another, for use as the ice might be lowered in hight, were hung and closed by latches. Outside stairways were made by which the two upper doors were reached.

ICE HOUSE.—FIG. 375.

This was done in the Winter of 1860. The owner, whose business was in New Orleans, was detained by the war and did not see his ice-house until 1865, in the Summer of which year it was opened, and some of the ice was still there in the center of the packing and a considerable thickness of the packing was frozen around it. I don't think much of the ice had melted, but believe the bulk of it had evaporated, knowing how rapidly blocks of ice will disappear by evaporation even in the coldest weather in that climate.

I do not know that there is any better way of constructing an ice-house than the above; but perhaps it was unnecessarily elaborate. Since then I have kept ice perfectly well in a corner of a barn by making a board partition at the required place, lining the barn wall inside and packing it full with clover chaff—which, by the way, is an excellent non-conducting substance, as are also buckwheat hulls, oat chaff and buckwheat chaff—and by packing the ice well with at least a foot in thickness of dry sawdust all around and above it.

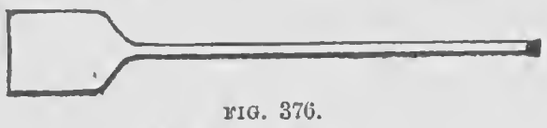

FIG. 376.

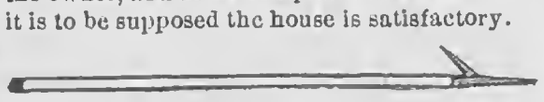
The ice-house attached to the dairy described in the last chapter, was made with double walls, a foot thick, the outer wall of common siding and the inner one of rough boarding without any protection, the space between these being filled with sawdust. No inside packing is used, but the ice is laid close to the inner wall, and every crevice is filled with broken ice so as to make a solid mass. At least, these were the instructions given to the owner, and as no complaint has been made it is to be supposed the house is satisfactory.



ICE FORK.—FIG. 377.

The easiest method of filling an ice-house is by a sliding trough upon which the blocks are drawn in by ice-forks or ropes to which ice-tongs are attached. The ice-fork consists of a long handle having two sharp steel points affixed at one end, one to push and one to pull with, as shown in cut fig. 377. Ice should be cut in cold, dry weather and packed as soon as cut. It should be cut in regularly-shaped blocks; 24x16 inches, or 18x12, is a convenient size, because with these the joints can be broken and each layer made to seal the joints of the one below it. In packing the house a quantity of broken ice should be kept on each layer and swept and packed into the crevices with a broom and a thin-edged wooden implement made for the purpose (figure 376). The fine dust left upon the ice will help to separate the blocks when they are taken out for use.

SOME RECENT NOTES ON THE CENTRIFUGAL CREAMER.

PROFESSOR G. C. CALDWELL.

Cooling the Cream Before Churning.

It has been found in some recent experiments, of which an account is given in a recent number of the Milch Zeitung, with cream from a centrifugal separator, having a temperature of 57 to 60 degrees, that if it was churned at once 17 per cent. less butter was obtained than if it was first cooled down to about 34 degrees; and on making a further application of this result it appeared that butter was in general more easily made from cooled cream. The importance of cooling the centrifuge cream is well understood in Sweden; therefore the use of this instrument does not do away with the necessity of ice or cold water in the dairy, and suitable cooling arrangements. Nevertheless there is no little gain in the smaller extent of these arrangements that would be necessary, and the shorter periods of time for which they would be called into requisition. When the cream was obtained by ordinary methods it was observed that if the milk was set at a temperature below 55 degrees, there was a loss of only 2.3 per cent. of butter in consequence of not cooling the cream before churning; but if the cream rose at a temperature of 60 or above, a loss of 19 per cent. of butter resulted from not cooling it.

Quality of the Butter from Centrifugal Cream.

When centrifugal separators were first introduced it was quite commonly asserted and believed that the butter made from the cream would not keep so well as that from cream obtained in the ordinary manner, and that, therefore, this process could not be used to advantage unless the cream or the butter was to be consumed immediately. There appeared to be, in the nature of the case, no good ground for any such assertion; supposing the cream to be as carefully kept, and the butter as carefully made in the one case as in the other, we should reasonably expect it to be equally good. In some recent tests of the centrifugal creamer, by Fleischman and Vieth, samples of butter from cream raised in cooled cans, and from cream separated by the centrifugal process were sent to an expert in dairy produce; most careful tests revealed no difference either in flavor or in keeping qualities.

Quantity of Butter Yielded by the Centrifugal Process.

Numerous experiments have shown that a greater weight of butter is obtained from a given quantity of milk with the centrifugal creaming process than with other methods of separating the cream; in the various tests that have been made, this increase ranged from eight to 30 per cent. The difference varying according to the character of the milk. It has been shown that this larger yield is really due to a more complete separation of the butter fat from the milk, and not to a larger proportion of salts and water or other foreign matters in the butter; the skimmed milk from the centrifuge is poorer in fat than that from the Swartz process or from any other method of setting the milk for cream in common use in Europe. In several comparative tests recently made the proportion of fat in the centrifuge skimmed milk ranged from 0.21 to 0.44 per cent; when the cream was separated by ordinary methods from milk of the same richness in fat, the proportion of fat left in the skimmed milk, though in some cases lower than the highest limit with the centrifugal machine, was in others fully twice as great.

The Temperature of the Milk and Yield of Butter.

The temperature of the milk as it flows into the centrifugal machine is a matter of great importance, as shown by numerous recent experiments. The last number of the Milch Zeitung contains an account of some trials with Fesca's machine which illustrate this point. On running about 11 pounds of milk at a temperature of 60 degrees through the machine per minute, the skimmed milk contained 1.5 per cent. of fat, against 3.1 per cent. in the whole milk, and from 38 to 40 pounds were required to a pound of butter; if the milk was first warmed to about 90 degrees when delivered from the machine, it contained but 0.5 per cent of fat if run through at the same rate; if passed through at the slow rate of 6.5 pounds per minute, the milk delivered contained in the two cases of cool and warmed whole milk, 1.0 and 0.3 per cent. of fat respectively. Fleischman and Vieth, as the result of a large number of experiments with a De Laval's centrifugal separator, found that the proportion of fat in the skimmed milk decreased invariably with the elevation of the temperature of the milk delivered to the machine. On raising the temperature from 48 to 100 degrees, and testing the milk delivered by the machine at several points between these two extremes, the fat fell from 0.58 to 0.15 per cent. These figures illustrate very strikingly the superiority of some machines over others, as well as the point under discussion.

These centrifugal machines are in great demand in Europe; some of the firms that manufacture them are crowded with orders faster than they can be filled. Their usefulness in the dairy is fully established there, and it is plain that they must sooner or later come into extensive use in our great dairy regions here. Meanwhile, valuable experience in their construction and management is being accumulated, of which we shall have the full advantage, when our dairymen shall come to realize the necessity of adopting this improvement over what they will not long hence regard as the clumsy and cumbersome method of setting the milk in pans or pails, that must be carefully kept cool for 24 or 36 hours before the cream can be obtained. Such slow and poky ways will then, at least so far as regards factory butter making, be turned over to people who still cast their votes for Andrew Jackson for President.

Floricultural.

A WESTERN FARM GARDEN.

WILLIAM FALCONER.

A reader of the Rural who resides in Morgan County, Illinois, has written to me for advice. She says:—"By the assistance of my two sons (one 16 and the other 12), who never saw a flower garden in their lives, I have laid off and made about 35 large and small beds, besides some winding paths with borders. I have several different designs, some, I think, very pretty for children to have made. I have also some large tubs as substitutes for vases. I wanted some kind of a lawn vase or basket, but could get none to suit me here."

Flower Beds.

I appreciate all attempts to beautify our homes by the use of flowers and ornamental gardens, but a multiplicity of flower beds is old-fashioned, and, I am happy to say, now an almost obsolete adornment. Neither have I any sympathy with the geometrical filiforms that once were fashionable as flower beds, for it is not the outline of the bed so much as what it contains that is modern art. The circle, oblong square, diamond, heart, and five-cornered star are the most desirable shapes. In the days of our forefathers the outline of the bed was its pattern, for at that time the beds were mostly scifs and ribbons, *i. e.*, each bed was either filled entirely with one kind of plant or with rows of several kinds. Now-a-days, however, the outline of the bed has but little to do with its pattern, only oblong squares and circles are most esteemed, because they are the easiest designs on which to define a pattern. The great variety of plants at our command and available for the flower garden renders it easy work to display in one bed intricate geometrical designs neatly and accurately, and of great diversity of hue.

But this is not the garden of the Western farmer who has no greenhouse but his window. He wants around his home trees and shrubs and vines and lovely flowers, bright and permanent—plants that want no hot-house nursing, but year after year come up again, each season stronger than before. Arranging such plants in a series of little beds is neither for the good of the plants nor consistent with modern gardening. Large oblong squares are the most convenient beds for perennials, for in such we can have masses of many plants and a continuance of bloom from April to November. Regarding the

"Winding Paths,"

I can only say meaningless walks annihilate the very end for which they are introduced; every path should be a needed one, and there should not be any path that is not needed. First determine that a path is needed there, then tone your path in easy, graceful curves. Straight walks, unless they cannot well be waved, are not desirable, and much less so are those of oft-repeated or deep S-like curves.

Garden Vases

are of great variety and necessarily high-priced. A vase to suit us depends upon whether we want the vase for its own ornamentation or for the same purpose we want a flower-pot or bed, namely, to grow plants in. Proper vases should be so constructed as to have an air chamber between the outside shell of the vase and the basin that contains the plant-roots. This is usually accomplished by the assistance of a zinc basin made to fit inside the earthen vase. This chamber counteracts the parching action of the sun and wind upon the roots, for in vases, as in pots, the most vital rootlets creep around just inside the casing of the vase, and therefore under ordinary circumstances they are the first to suffer from heat and drought. But if the vases be heavily filled with drooping plants before they are put outside, the inside basin may be unnecessary, the green mantle being protection enough. Wooden vases, as tubs and half-barrels, need not have the inner basin, as the action of the weather injurious to the roots is very much less on wood than on earthenware. There are many cases in which vases are admissible to the garden, but in no sense, nor under any circumstances, can I countenance the garden use of vases for the vases' sake. The plants the vases contain are the ornament, the vases are merely flower-pots, and the better the pots are hidden by the plants, the prettier appear the vases.

Scientific and Useful.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION,

BULLETIN No. 49, OCT. 30, 1880.

Analyses of Swamp Muck.

446. Muck No. 1. Upper stratum.
447. Muck No. 1. Lower stratum.
448. Muck No. 2. The above were sent by D. H. Van Hoosear, Secretary Farmers' Club, East Wilton.
449. Cured Muck.
450. Fresh Muck. Sent by S. B. Wakeman, Saugatuck.
451. Muck. Sent by G. W. Stanley, New Britain.
452. Fibrous Muck, from above 453.
453. Bottom Muck, from below 452. Sent by Henry Hine, Oxford.
454. Mucky soil of drained meadow, from Augustus Storrs, Mansfield.
465. Swamp Muck, from Ed. C. Birge, Southport.
467. Swamp Muck. A, upper layer, B, lower layer; from Lewis Davis, Milford, Ct.
492. Muck, from W. E. Simonds, Canterbury.

ANALYSES OF SWAMP MUCK.

The fresh or undried samples contain per cent.:—

The organic matter of the mucks contains per cent.:—

Nitrogen	2 57	1 25	2 58	2 44	2 40	1 69	1 10	3 44	2 68	2 57	2 68	2 59	2 63

Samples 446, 447, and 448 are from a swamp of ten acres, owned by Messrs. John and Andrew Jackson, of Wilton. 446 and 447 are from the head of the swale, the former from the surface, the latter from a lower stratum. 448 was taken from the same swale one-half mile distant and at a lower level. Muck from both localities has been used for many years as an absorbent, and also applied in Spring direct to crops after having been dug in Fall and exposed to air and frost during Winter. 446 and 447 have given very good results. 448 has been less valuable.

The analyses show large differences of composition, in the fresh samples. We observe, first, that 446 is a very pure muck and quite fully saturated with 80 per cent. of water; 448 is drier and contains 45 per cent. of soil and mineral matter, while 447 stands intermediate. If the three were applied in corresponding states of dryness, we can see that in the first two we should have much more organic matters, with more nitrogen, and likewise more lime than in the last. This appears from the figures above given showing the composition of the dry, water-free mucks.

The per cent. of nitrogen and that of lime in the dry samples may be taken as fair measures of their relative value. 446 ranks accordingly among the best, while 448 is nearly the poorest of the samples here reported.

The inferiority of 448 is evidently largely due to the fact that three-fourths of it nearly are sand or soil. Reference to the last line of figures in the table shows that the organic matter which it contains is as rich in nitrogen as that of 446. We see, in fact, that in both these and in seven of the other samples the organic matters contain about 2½ per cent. of nitrogen.

449 and 450 are, it is understood, two samples from the same bed, the former dug a year ago or more, and exposed during the Winter, the latter a freshly excavated sample. The cured muck, 449, is used as an absorbent and for composting. The questions asked by Mr. Wakeman are: "Is the cured muck worth carting 100 rods to use as an absorbent and in compost?" and "has the muck any value in its fresh state?"

The differences in composition which appear in the undried samples are almost entirely due to their unlike proportions of water, viz: 38 and 85½ per cent. Dry, they agree in containing about 90 per cent. of organic matter with 2.2 per cent. of nitrogen, and about 10 per cent. of ash with two per cent. of lime.

To Mr. Wakeman's questions the following answers were given:

1. 449 is well worth carting 100 rods to use as an absorbent. It contains, as analyzed, with 38 per cent. water, nearly twice as much nitrogen as good stable manure, and of this there can be no reasonable doubt that a good portion would become available to crops, especially after composting with dung and urine. It also contains four times as much lime as stable manure.

2. As to the value of 450, the fresh-dug muck, it would doubtless be serviceable if well pulverized and distributed upon sandy, droughty soil. It contains nothing injurious to vegetation.

The chief advantages of "curing" muck by exposure to air and frost are, 1, pulverization, 2, removal of a share of the useless water, and 3, removal of soluble poisonous salts of iron. 450, like all but two of the samples here reported, is free from injurious iron-salts, and except for the cost of carting its extra water and the convenience of application, it might most probably, be applied as well fresh as cured.

451 was a well cured or dried sample, but still retained 32 per cent. of water. The composition in the dry state shows it to be rather above medium quality, with 1.9 per cent. lime and 1.3 per cent. nitrogen. Its contents of sand and soil (15 per cent. or more of the dry muck) depresses the nitrogen, but the organic matter itself contains a less proportion of this element than that of any other sample except 452.

452 and 453 represent respectively the upper and lower layers of the same bed. 453 was coarse and fibrous from undecayed vegetation. The organic matter of 453 was more fully decomposed but was admixed with clay and fine soil to the extent of seventy-four per cent. These are the poorest mucks here reported, averaging, water-free, but one-third per cent. of poor lime and one per cent. of nitrogen. The bottom sample contains some soluble and poisonous iron-salts which would disappear by thorough weathering, or more speedily and certainly by composting with ashes, potash or lime. Such muck would probably not pay to apply fresh except on light leachy land, and there would be of advantage mainly as an amendment of too great porosity and dronghtiness and not as a fertilizer.

454 is an interesting sample, as it represents a piece of meadow land that has been drained and cultivated for three or four years, but all attempts to get crops of buckwheat, corn or turnips have totally failed—even weeds do not grow upon it. The surface of the ground as it dries becomes white as if salt or plaster had been sown upon it. The barrenness of this soil is due to iron-salts soluble in water, mainly proto-sulphate of iron, the same thing as copperas or green vitriol, which is present in considerable proportion and which thus poisons and destroys all vegetation. The remedy is a copious application of leached ashes or lime. Unless there is permanent bottom water also poisoned by iron-salts, the lime will shortly cure the difficulty. The sample is more of a muck than a soil, containing 60 per cent. of vegetable and volatile matters, and not only has excess of iron-salts but is deficient in lime and presumably in other mineral plant food, so that leached ashes would be the most suitable application.

485. This muck is seen, from the statement of its composition in the water-free state, to contain nearly 90 per cent. of vegetable matter with 2.3 per cent. of nitrogen and 1.5 per cent. of lime; it is accordingly of excellent quality. Mr. Birge states that it can be delivered on the adjacent upland at 18 cents per cart load of 25 bushels. Mr. Birge asks:

1. After letting it dry on the upland, will it pay to cart to the yard one-half or three-fourths mile distant for litter?

2. Will it pay to top-dress pastures near the swamp with the raw muck?

3. Will it pay to compost with lime at the swamp?

Queries 1 and 3 were answered in the affirmative. In reply to the second question, a doubt as to the advantage of its direct use was expressed. Plainly, however, actual experience alone can positively decide these questions, and the answers given, being offered without a careful examination of all the circumstances of the case, are merely opinions that are intended to be safe, but are not expected to be exact.

467A and 467B are respectively the black upper and the brown lower layers of the same deposit. Mr. Davis asked which is the best, and if either or both are worth applying to sandy loam directly or after composting with something besides yard manure.

The analyses indicate the muck to be of the best quality. The lower portion is, however, largely mixed with soil. This renders it less rich in nitrogen and lime, and therefore inferior as a fertilizer, but as the soil it contains is mostly of very fine pulverization, it is not less valuable as an amendment on light, open-textured soils. The best materials, next to stable manure, to compost with would be unleached wood ashes, or fresh burned and slaked lime. By slaking the cheapest oyster-shell lime mixed with, say, one-tenth as much kainite (potash salts) or low grade sulphate of potash, and composting with the muck, the latter will not only yield its nitrogen rapidly, but its lack of potash, magnesia, etc., will be supplied. To one cord or 100 bushels of muck, 10 bushels of lime may be used.

492 is also a muck of high quality, judged from the analysis, the dry substance containing over two per cent. each of lime and nitrogen.

In conclusion I would refer my readers, for full details as to methods of handling and composting, to my Report on Peat and Muck, published in Transactions of the Connecticut State Agricultural Society for the year 1858, and afterward revised and enlarged and issued by Orange Judd & Co., under the title "Peat and its Uses as Fertilizer and Fuel."

F. W. JOHNSON, Director.

Miscellaneous.

BRIEFLETS.

MR. J. J. H. GREGORY writes us that he is afraid that we shall have to go to the tropics to get seed from the Branching Sorghum. But we think it will seed in Virginia. We have picked a number of fully ripened seed from our plants of the past season, and the seed was sown late. . . . . One of the most serious mistakes which farmers make is to work out in the rain, snow or sleet, and to allow their sons to do so. Thus heavy colds and malarial diseases are frequently contracted, which, though they may pass away, have their effect in undermining the health and in shortening life. . . . . Gather the leaves. Cover them with earth, so to remain until another Fall. This makes the very best of soil for potting plants. . . . . And now there is a variegated ailanthus. It is hard to find out what anybody wants an ailanthus of any description for. If it were the only tree that grew upon the earth—well, even in that case we should prefer to enjoy it upon our neighbors' premises.

Old folks and young folks! are you reading Farming for Boys and Girls? If not, begin now, while yet the early lessons are before you. Read them, if not for *your own* instruction, so that you can talk them over with your children and thus engage or deepen their interest in what may prove of great service to them in after years. . . . . Thanks to Mr. John Saul for a package of new plants. . . . . In a sketch of the life of Charles M. Hovey and his services to horticulture, the Mass. Ploughman says that in 1837 he "produced the azalea and other flowers from seed by hybridization." Would the Ploughman kindly inform us what were the parents of the azalea—that is, what plants Mr. Hovey crossed, the seeds of which produced the azalea? (!)—"Among evergreens he has produced a fine Chamxgparis." Will the Ploughman also kindly inform us what sort of an evergreen that is? . . . . . To inquiring friends: The Niagara grape is not for sale. We do not know when it will be offered. . . . . Those who want handsome shrubs that will grow close to the house and thrive with little or no care should select the privets and bush honeysuckles. . . . . We see that James Veitch & Sons, of London, are advertising new varieties of Iris Kæmpferi (Lævigata), seeds of which we sent to our subscribers in our last free distribution. They announce 12 different kinds and charge an average of one dollar for each plant or root. We quote from their advertisement:—"It is quite impossible in words to give an idea of the splendor and symmetry of these flowers. They fall into two groups—those in which the three outer segments, petals or falls are large and grow downwards, the inner segments or standards being small and upright; and those in which the outer and inner segments are of equal size, giving the flowers a round and symmetrical appearance; such flowers being termed 'duplex,' At the base of the segments in most of the varieties is a yellow or orange blotch or eye, contrasting most beautifully with the ground color of the flower." We hope that some day or other the value of our seed distributions will be appreciated. We have a strong faith that several years hence the iris will be esteemed as highly as was the gladiolus ten years ago.

THE BUSSEY INSTITUTION.

IN giving a list of the agricultural colleges in the United States in the RURAL of October 30, we inadvertently omitted the name of the Bussey Institution at Jamaica Plains, Mass., of which our esteemed contributor, Professor F. H. Storer is the Dean and also Professor of Agricultural Chemistry. By way of reminder of our omission our friend sends us a circular of the institution, which shows the wide range of instruction there given in agriculture and horticulture as well as in kindred studies. Professor Storer says:

"We call ourselves a school, as you see, but that circumstance doesn't make the fact any less true that the instruction given at the Bussey Institution, is not surpassed by that of any agricultural "college" in the country. Indeed, in all the list given in the RURAL on page 723, there are not more than three schools that deserve to be mentioned in the same connection with the Bussey Institution, as colleges of agriculture. Moreover, we are devoted *solely* to agriculture, horticulture, and veterinary science as related to agriculture. I suppose the omission from your list is explained by the fact that the name of the Bussey Institution was seldom if ever given in the lists of agricultural schools formerly published in U. S. Agricultural Reports. At the time, I thought so little of the authority that I never cared to take the trouble to correct the error. But I must confess to a pang when one of the leading agricultural papers of the country calmly ignores us as if we were doing nothing for the great cause of agricultural education, and as if our earnest endeavors to give the best possible instruction, calmly and quietly, were of no account."

THE BOOK PREMIUMS AND MR. STRONG.

DID this gentleman win the book premium he claims, or did he not? As it is time this question were settled, I now proceed to relieve the doubts of our disappointed friend with a few facts, so clear and unmistakable that he will not fail to see his error. As Mr. Strong has seen fit to change his complaint into an attack, he places me under the necessity of showing that he owes an apology for the course he has taken, and the language used.

The decision made by our company, that he did not win the Book premium, was based on reasons perfectly unanswerable. Hence instead of attempting to answer them, he simply persists in claiming an award that he has not earned. At the same time he gratefully accepts a discretionary award made by our company, which was entirely voluntary on their part, and was simply offered because they were pleased with a performance that fairly took a premium from another party, although it did not at all meet the case of our offer.

But let us now frankly say to Mr. Strong, that there is another reason why he failed to win the books. *There is a fatal error in the figures reported.* If he is a practical farmer, he ought to know that a shrinkage of corn amounting to less than one per cent. after three or five months from harvest, is too absurd to be entertained. But the weight he reports makes the shrinkage even less than three-quarters of one per cent. Whether the second weighing was three months or five months from harvest, we have no means of knowing. We have not seen or heard of any regular and certified report from the competitors under our offers, and did not even know that any parties were trying for them, till about the 1st of April, when we received a brief pencil memorandum of weights which certain parties had sent in to THE RURAL.

Absurd, however, as this claim evidently is, we shall not cancel the discretionary award already accepted by Mr. Strong. On the contrary, we will still give him a chance to win the coveted books.

If he will at any time within three years produce the same amount of corn as he has here reported, and from the same number of kernels planted, and will send in a proper report of the WEIGHT PER BUSHEL at the proper time, and all duly verified, and showing that the shrinkage at three months is not more than three-quarters of one per cent., we will not only hand over to him the books in question but also a library of 100 volumes from Harper's Half Hour Series. CONRAD WILSON,

On behalf of Farmers' Pub. Co.

AN INTER-STATE AGRICULTURAL CONVENTION is to be held at Springfield, Ill., on November 30th and December 1st and 2nd. Its object will be to discuss and, if possible, adopt a uniform system of reports, that shall give to farmers and others prompt and reliable information in regard to the probable and actual grain, fruit and meat supply of the great West. Other topics of mutual interest will be discussed, with a view to increasing the efficiency of each State Board by union with and knowledge of the methods of others.

CATALOGUES, ETC., RECEIVED.

ILLUSTRATED Descriptive Catalogue of Daniel F. Beatty's celebrated grand, square and upright Piano-fortes and Golden-Tongue, Church, Hall or Parlor Organs, Washington, New Jersey. This is a large catalogue of 56 pages, profusely illustrated and giving all needed information to those who are interested in the above instruments. Sent free to all.

How Pure Milk may be Supplied to Boston at reasonable prices to consumer and fair returns to producer—A pamphlet of 20 pages treating of a matter of importance to every inhabitant of every town in the Union as well as to the surrounding farmers—how to supply good milk not in Boston alone but also in all other towns and cities at fair prices to consumers and fair profits to producers.

WHAT OTHERS SAY.

The Harmless, Useful Toad.—A writer in the London Journal gives some interesting statements respecting the toad. In the matter of feeding, he says the toad is not very particular, either as to quality or quantity. Anything that creeps or crawls will do for him—wood lice, beetles, spiders, slugs, worms, even snails with their shells, are put out of sight as if by magic, for he has a peculiar way of taking his prey. He watches the moving insect for a second or two, then, suddenly darting out his tongue while at a distance of one or two inches, the insect is snatched up and swallowed instantly. One evening he gave one a wasp and a humble-bee; both were snapped up directly they commenced to move, apparently without causing the toad the slightest discomfort, though they must have reached his stomach in a tolerably active condition.

In plant-houses, especially forcing-houses, where insects increase their numbers so rapidly at all seasons, the toad's services are especially valuable; and if a suitable ladder, made of a narrow board with bits of lath tacked on it two inches apart, be set in a corner, slanting from the floor to the stage, he will climb it, and thus be enabled to make himself still more useful.

But perhaps the most remarkable fact concerning the toad is, that though he can, and does, eat a great deal, he can exist a long time without eating anything. Years ago he buried one for a month in the earth, as an experiment, and when dug up it was apparently as well as ever. More recently, having been bothered with myriads of wood-lice in an early cucumber-house, and not being able to find toads in February, he, later on, when they became plentiful, buried three in a nine-inch pot, with a slate on the top, 18 inches under ground, that he might have them handy for the next early forcing season. But that season he did not require them, so they remained buried until the following one, and were then, on being taken up, apparently not much the worse for their eighteen months' fast, though they didn't have any ice-water or alcoholic baths.

There is one system of tillage, says the London Chronicle, far too prevalent, in small gardens particularly. It is that of digging and manuring only one spade deep till a few inches of the top soil are poisoned with dung, and turned into a moving mass of slugs and grubs, while the subsoil is as hard as adamant.

Stirring the Soil.—It is more than 200 years ago since there lived Jethro Tull, the famous agriculturist, who was such an enthusiast for stirring the soil that he formed the opinion that crops could be produced without the aid of manure. It is a matter of considerable importance, remarks the Gardeners' Chronicle, that the atmosphere should enrich and sweeten the soil, and unless its surface is in a fit condition to allow the air to permeate it, its valuable properties are lost. Travelers inform us that the Greeks in their vineyards throw up the earth between the vines in ridges, the object being to enrich and sweeten the soil by exposure, adding and mixing manure with the ridge of earth before returning it to the roots, which it would appear they are in the habit of pruning annually.

Applied Science.—Professor Huxley, in his address delivered on the occasion of the opening of Sir Josiah Mason's Science College, at Birmingham, on Oct. 1, said:—"I often wish that this phrase, 'applied science,' had never been invented, for it suggests that there is a sort of scientific knowledge of direct practical use which can be studied apart from another sort of scientific knowledge which is of no practical utility, and which is termed 'pure science.' But there is no more complete fallacy than this. What people call applied science is nothing but the application of pure science to particular classes of problems. It consists of deductions from those general principles, established by reasoning and observation, which constitute pure science. No one can safely make these deductions until he has a firm grasp of the principles, and he can obtain that grasp only by personal experience of the processes of observation and of reasoning on which they are founded."

"The fact is," says the Western Rural, touching a subject to which we have many times referred, "children under 12 years old instead of being set to steady labor, should be sent to school and to play. Their muscles need an unimpeded growth—their bones and joints need consolidation, and their minds need free scope among the beauties of nature, in the pure air, and under the blue sky. But after this, up to 18 or 20 years, they are still growing, and being knit together for the great battle of life, health and happiness; and hence parents cannot be too careful in giving wholesome admonitions and practically guiding them in the flowery pathway of health, which depends materially on the proper use or the abuse of the organs of the body in childhood and youth."

Hedges.—In treating hedges of Osage, Honey Locust, or other deciduous plants, remarks Mr. Meehan, we like the plan of letting them grow as they will for two or three years, and then, when the stems are a couple of inches thick, saw them to the ground. A mass of strong sprouts then pushes up, which can be pruned into shape the next Summer. Where hedges are to be thus made, or older ones have been neglected, they can be cut down to the ground any time in the Fall or Winter season. It seems that in spite of all that has been said, Osage Orange and Honey Locust are the best plants for farm fences, or where any very strong fence is desired. Berberry, Silver Thorn, and Pyrus Japonica are the next best—indeed, except that it takes rather longer to make a good fence, the last named would be as good as the first two in all except cheapness.

The Best Autumnal Roses among Hybrid Perpetuals.—The two Roses which will give the greatest number of really fine blooms after the first of July until cut off by the frost, are Marguerite de St. Amaude and Francoise Michelon, says Mr. Ellwanger, in the Gardeners' Monthly.

Below are given in order of merit the best twenty-four autumnals; as La France now goes in the class of the Hybrid Teas, it is not included in this list; if it were, it would have the place of honor:

LIGHT COLORS.

1. Francoise Michelon,
2. Marguerite de St. Amande,
3. Countess of Serenye,
4. Abel Grand,
5. Mdlle. Therese Levet,
6. Baroness Rothschild,
7. Mdlle Eugenie Verdier,
8. Paul Neyron,
9. Victor Verdier,
10. Countess of Oxford,
11. Rev. J. B. Camm,
12. La Reine,
13. Mme. Boll,
14. Princess Charlotte,
15. Boildieu,
16. Baronne Prevost,
17. Anna de Diesbach.

DARK COLORS.

1. Alfred Colomb,
2. Marie Baumann,
3. Horace Vernet,
4. Pierre Notting,
5. Maurice Bernardin,
6. Louis Van Houtte,
7. Prince Camille de Rohan.

Killing Codling Moth and Canker Worm.—There seems to be no doubt but that water, in which Paris green or London-purple has been put, if pumped over the trees through a hose from a garden engine when the fruit is first forming, will prove a perfect security against codling moth and canker worm. We do not like the idea of using these poisonous substances in things we directly eat, says Mr. Meehan.

Manure from Swamp Muck.—To make a complete manure from swamp muck, says Dr. Stewart, we would proceed as follows: Take of seasoned swamp-muck 40 bushels, or one two-horse wagon load; mix thoroughly with it five bushels of wood-ashes, 100 pounds of fine bone flour; 100 pounds of finely ground plaster, and throw it into a heap, in which it will heat and ferment, and leave it for two or three months. This will be equal to twice its bulk of the best cow manure. If night soil could be added to it, it would be increased in value.

What are Diatoms?—The New York Times answers: Diatoms are microscopic aquatic vegetable organisms, endowed with a power of motion, and consist of simple cells covered with a coating of silex and increase by a process of budding and separation. Their structure is very curious and beautiful, and some species have their silicious coatings exquisitely marked, and thus form interesting objects for study under the microscope. They are very minute, measuring a thousandth part of an inch up to twice that size. Some species of the genus Bacillaria are supposed, with good reason, to invade the blood of animals and to produce various febrile diseases, such as hog and chicken cholera. It is highly probable that the largest number of diseases which affect animals most virulently are produced by the infection of the blood by these minute organisms, which by their rapid increase disorganize it and render it unable to support life. A large variety of these diatoms are found in guano, into which they have doubtless been carried in the excrements of sea birds, which have either fed upon these vegetables, or upon fish which have eaten them, as they exist plentifully in sea water. The bulk of large beds of rocks is formed of the remains of diatoms, and the bed of the ocean for hundreds of miles in places consists of mud formed of their shells or coatings.

Manuring for Potatoes.—The distinguished chemist, Dr. Augustus Voeleker, says that he has made a good many experiments on the potato crop with a view of ascertaining how the produce could be raised, and he has found that when the manure is applied early in Spring, so that it becomes thoroughly part and parcel of the soil in which the potato is grown, the effect is superior to what it is when the same manure or the same manuring mixtures are applied later in the season. Cover them in and get them as much distributed as possible with the soil. There must be time allowed for the mineral constituents to be thoroughly changed in the soil. We know, as a matter of scientific interest, that the form in which plants take up their food is not the crude state in which we apply it. Take, for instance, the case of potash. If you apply potash in the month of April for the potato crop, it is practically of no effect whatever. We usually apply to the land a cheap salt of potash, the crude potash salts which are very largely imported from the North of Germany, kainite or crude potash salts, and if you apply them in the Autumn they undergo a series of chemical changes—the potash gets fixed in the soil, other constituents pass into drainage, which are considered of less importance, and then you get the potash not so soluble as to injure the crop nor so insoluble as to be ineffective. You obtain the necessary element, potash, in a condition much more favorable to the healthy growth of all plants, not only potatoes, than you obtain it by crude application. Potash is not more specially necessary for potato culture than it is for any other crop—for wheat or turnips. The fact is that all green crops take a very large proportion of potash out of the soil, that has to be supplied in some shape or other, in the case of light soils especially.

Horse-meat as Food.—Some very interesting statistics have been published by the society for promoting the use of horse-flesh and the flesh of asses and mules as food, showing how steadily the consumption of these articles of diet has been increasing in Paris and the provinces since the foundation of the society in 1866. The London Agricultural Gazette says that the weight has increased from 171,300 pounds in 1866 to 1,982,690 pounds in 1879. In the principal cities of the provinces the consumption of horse-flesh may be considered to have fairly taken root. At Marseilles, in 1870, there were 599 horses eaten; 1 031 in 1875, and 1,533 in 1878. At Nancy, 165 in 1873, over 350 in 1876, and 705 in 1878; at Rheims 291 in 1874, 423 in 1876, and 384 in 1878; at Lyons 1,839 in 1873, and 1,313 in 1875. The average price of horse-meat is from 25 to 30 cents per pound. Each horse furnishes about 200 kilogrammes (400 pounds) of meat, which is capable of being prepared in many by no means unappetizing ways, such as *pot au-feu*, boiled, roast, hashed, haricot, jugged, filet, etc.

Inoculation as a Preventive of Anthrax.—M. H. Toussaint, the celebrated French veterinarian, has been making a large number of experiments on different animals to discover some preventive of anthrax or black-leg, and finally declares that after many unsuccessful attempts he has at length arrived at a very simple method of effecting his purpose, and this is done by inoculation. It is well known that some animals, like the pig, never take anthrax, while others, and among them some kinds of sheep, resist inoculation for the disease. The great merit of his method of inoculation is that it is always effective, and in a letter to the American Veterinary Review for October, he discribes his mode of performing this operation.

"I first used the filtration of carbuncular blood from a dog, sheep or rabbit he says." "For that purpose I took the blood of an inoculated animal, as he was about dying or immediately after death. This blood was defibrinated by beating, run through a cloth and filtrated through ten or twelve sheets of paper. It is by this process that three pups three months old, and the first ewe, were vaccinated. But this is a dangerous method and not at all practical, as often the fissures allow bacteridics to pass through, and they cannot be recognized with the microscope, as they are very few, and then animals which we wished to save were killed. Being unable to obtain a filter giving a sufficient quantity of filtrated matter, I used heat to kill the bacteridics, and exposed the defibrinated blood to 50° temperature for ten minutes. The result was complete. Five sheep vaccinated with three cubic centimeters of this blood have been inoculated with very active carbunculous blood and showed no effect from it. However, to obtain a complete immunity, it is necessary to make several inoculations. Thus, after the first preventive inoculations, I inserted under the skin of the ear of two sheep carbunculous blood of the rabbit and spores of culture. One of these died with a large number of bacteridies in the blood. I then inoculated again the four remaining sheep with the blood of the dead sheep, after heating it to 55°, and since that time each sheep has been inoculated twice with carbunculous blood without result."

Everywhere.

MICHIGAN NOTES.

There may be better locations on "Uncle Sam's" farm for hoarding up wealth than are found in Manistee County, but for the poor working man, there are but few better localities in which to get a comfortable living, and keep a respectable hold on society than in the various towns of this county. To be sure he must labor if he is desirous of rising in the world; but if he is ordinarily careful, he will enjoy the best of health, and that will add to his happiness as bags of gold would never do with disease eating at his life and heart.

The soil throughout the country varies from a light sand to a rich clayey loam, with a limy subsoil. The timber is maple, beech, elm, ash pine and hemlock, readily convertible into lumber if desirable. The old forest trees have grown to a great hight, and many of them are of gigantic size. Wheat, rye, oats, barley and corn are grown to a considerable extent. Fruit growing is proving a success, and large orchards are beginning to appear on many farms. Berries of almost all kinds are found in every successful farmer's garden to a greater or less extent, and nowhere can one find finer garden vegetables than can be raised here. For grains, fruits, and vegetables the stands at our county fair would compare favorably with those in any county in the State. Summer pasturage for stock costs almost nothing; for from the first of April cattle feed in the woods, and by the first or middle of June, are ready for market. Our Winters are long and often accompanied with deep snows, but the thermometer seldom falls ten degrees below zero. On the coldest morning during the past Winter the mercury stood 5° above zero. The Winter previous, it went but 2° below. Land can be bought for from $1 25, up to any figure, according to location and improvements. Go into what country you will, and you will find discontented ones, who wish always to be on the move, and these are always ready to sell cheap for cash. Such are found here. Energetic men frequently come and buy these places, go on with improvements already well begun, make a good living, and think it is one of the best localities in the world. There are some here who have been East, West and South and now declare that, all things considered, they could do better here than anywhere else. The grasshoppers are never a pest; the "tater bugs" can be vanquished; cyclones as yet have never visited this region. Work is plentiful, and wages are good. Farm hands get $15 to $18 per month; carpenters, $2.00 and $2 50 per day.

Education receives more than ordinary attention. It is the aim of almost every district to procure good teachers. Churches of various denominations are organized in nearly or quite every town in the county, and the most fastidious may find congenial society. Literary circles are numerous, instructive, even in seemingly out-of-the-way places. Thrift and enterprise are seen here and there through the various townships. Handsome frame houses are taking the places of the old pioneers' cabins, and well improved farms, with fruitful orchards occupy the place that twelve years ago was one dense forest. M. E. A.

Bear Lake, Mich.

RURAL SPECIAL REPORTS.

Bozeman, Gallatin Co., Mont. Ter., Oct. 26.—The seeds and plants the Rural was kind enough to send me last Spring were duly planted, with the following results:—Golden Ovoid Mangels attained large size, although the season was short and very dry and unfavorable for root crops; used irrigation. Mold's Ennobled Oats, planted in drills, were the best filled and prettiest-looking oats I have seen; but unfortunately Jack Frost nipped them severely; used irrigation. Magnolias and Ables Siberica didn't come up at all. The other flower seeds came up and are doing finely. The Cuthbert Raspberry plants were received in splendid condition and planted in good, rich, dark soil (dark clay loam), situation partly shaded. The plants commenced to grow, but afterwards died. I experimented with 50 Cuthberts, which I bought of E. P. Roe, in Cornwall-on-the-Hudson, and planted them right alongside of Turner, Philadelphia, Herstine, Davidson's Thornless and Mammoth Cluster; but not a single plant survived, while all the others (except Herstine, which didn't make a very rapid growth) were growing finely and fruited abundantly. The Snyder Blackberry, of which I set out 50 plants early last Spring, shared the fate of the Cuthbert—not a single plant survived. My farm is about 4,900 feet above sea level, and is situated on the head-waters of the Missouri River, at the foot of the Rocky Mountains, in Gallatin Valley, Montana Territory. I set out an orchard last Spring and shall report the results to you next year. The trees are all looking well so far, and five cherry trees fruited last Summer. Winter wheat froze out to a certain extent last Winter, and

although of A1 quality, turned out only about half a crop. Spring wheat got hurt by the frost and most of it will only make chicken-feed. Oats turned out good; the frost hurt them but little. Potatoes were good, both in quantity and quality. A. G.

KAN., Parsons, Labette Co., Nov., 2.—We have had ice a quarter of an inch thick. Wheat never looked better in spite of the small rainfall; our dry time is of two years' duration and is manifested now in the drying up of the creeks. The R. R. shops here are bringing water on the tenders for the use of the shops. Further west the roads have carried the water for the use of the engines, nearly 200 miles. The two eastern tiers of counties in the State have nearly an average crop of corn, but it is known that Kansas will need all the corn that she has raised. Hay is being shipped from Kansas City 200 miles west for the use of stockmen. Can this pay? No, but a greater loss may thus be avoided. Why don't they sell the stock? Because the stock is so thin it is not salable, and the hope is entertained that a mild Winter and the dry grasses of the Southwest will tide them over the Winter. Corn is being brought to market rapidly and being shipped as far as Galveston, Texas. It is as dry as corn is in Illinois in May. Wheat, potatoes, oats, apples and flour are being shipped to Texas. Cabbage, onions etc., also pass here daily in car-loads to the same destination, and there never passes a train from or to St. Louis that has no lager beer cars. Texas has a good crop of corn this year, but probably not half as much as is required. Her corn is generally poor in quality, and the weevil makes sad havoc with it. Cotton and sugar growing will continue to buy breadstuffs and meats from the West, simply because it is a matter of economy, in spite of the spasmodic cry of raising enough for home consumption. We are having the business boom strong. Bricklayers are receiving $5 per day and carpenters are receiving $2 25—an increase of 50 cents in two months. Winter wheat is worth 60 to 75c; corn 21c; oats, 25c; flour, choice, $2 35 per 100 lbs. by the quantity; potatoes, 50c; onions, 60c; apples, 50c; coal 12½c; per bushel; pine lumber, $25 to $50 per 1000 feet; castor beans, 85c. per bushel of 46 pounds. The price a month ago was $1.30. The crushers have agreed to crush prices. The crop was light this year, but the high prices at which most of the crop was sold have made it the best paying crop of the year. As usual farmers are all "going into beans" next year, when, of course, the few crushers will pay them just enough to induce them to put in another crop. J. B.

MICH., Fowlerville, Livingston Co., Oct. 30.—Wheat is worth 96c; corn, 25c; potatoes, 25c; butter, 20c; eggs, 16c, so we farmers ought not to find much fault. H. C.

N. Y., Erieville, Madison Co., Nov. 3.—The Eunobled Oats would have done splendidly were it not for the grasshoppers. The straw grew very heavy and the heads were fine; but the hoppers took more than half of them. I only got three quarts, but these I have put carefully by and hope for better luck next year. The cow-peas I planted in rows about 3½ feet apart, and one foot apart in the rows. They grew about two feet high, spread out about four feet and made a perfect mat. They ripened in September and I have saved seed enough to try them again in a larger way next year. The Beauty of Hebron potato did splendidly this year. Last year I had bad luck with it; but I saved "seed" enough to plant 72 hills this year. The first ten hills I dug would have made a bushel, but I left a part of them in the ground until late when I found them badly rotted. They ought to be dug when mature; then there is no danger of their rotting if stored in a cool cellar. My cellar is cool and dry and my potato bin is raised six inches from the cement floor and in it the tubers are put as soon as dug. If there are any signs of rotteuness in any the affected tubers are sorted out, and whenever a new load is added, I sprinkle a little unslaked lime over them, and I've never had a potato to rot. Blount's Corn I planted again this season, and it didn't grow so high as it did last year. It had two to three ears on a stalk and part of it ripened. I think that next year I can get it all to ripen, if we have a good corn year. I planted the Pearl Millet on June 10, and it grew eight feet high and headed, and I think some of the seed will grow, but I hardly think it would be safe to raise it here for a fodder plant—as it was a warm sandy place on which I tried it. Some Early Amber Sugar-cane of mine grew 12 feet high and ripened seed; I could raise it as well as corn, if enough of my neighbors also grew it so that we could get the proper machinery for making sirup.

S. J. V. C.

NEW YORK, Corning, Steuben Co., Nov. 3.—Wheat is looking fine—very different from what it looked a year ago. The past season has been one of good cheer to the farmer; for most crops have been good, and although they may not bring so much money as on some other years, he naturally feels better with heavy crops, than with light ones. Apples have been a very heavy crop here as well as in other places, and we are obliged to dispose of them at a very low price and thousands of bushels will not be gathered; but they will not be lost for all that, for the cattle and other animals can make good use of them, as it is found of late years that they are of much more value for stock feeding than was formerly supposed. I hear the Beauty of Hebron Potato spoken well of by all who have tried it. Many farmers complain of the Early Vermont rotting badly, while other varieties, by the side of them, rotted but very little. What is the verdict of the RURAL NEW-YORKER'S readers? Is it more subject to rot than other varieties? Corn husking is not yet completed. More plums were raised the past season than in several years together. I tried the experiment of planting field corn in drills this year, and will say that, for one, I do not like the plan at all; for it is more work all through the season, and the corn was not as good as where planted in hills. The best method, I believe, is to row it both ways, so as to run the cultivator both ways. F. H. D.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

West Highland Cattle.

R. M., Lovett, Md., asks: what sort of cattle are the West Highlanders, and whether any have been imported into this country.

ANS. The West Highland cattle, also known as Kyloes, are a small breed, the weight of a well-fed bullock usually ranging from 600 to 800 pounds—flesh, hide and tallow. They are an original breed, bred for centuries in the Scotch Highlands and the Hebrides, the roughest climate and country in Great Britain. Owing to the nature of their ranges and the rough treatment they receive, they possess great hardihood and endurance, and the bulls are remarkable for their power of transmitting their special characteristics to their progeny when crossed on cows of other strains. They mature early and their flesh is beautifully interlarded and laid on thickly on the choice points. From exposure to inclement weather for centuries their coat is very shaggy and thick, enabling them well to withstand the rigors of Winter. They are very picturesque and aristocratic in appearance and hence are highly prized for pasturing among deer in English parks. Their prevailing colors are black, red, yellow, dun, cream and brindle. The head is short with fine muzzle; the forehead broad and overhung with long, shaggy hair; the eye prominent; the horns wide and curving gracefully; the ribs boldly arched; the legs short and muscular; the back straight; and, as remarked, the body covered with a profusion of shaggy hair. We do not know of any importations of cattle of this breed into this country; though they would certainly be profitable in some of the rugged regions of the West, as their hardiness of constitution and thick coats would adapt them excellently to the conditions of such districts, while their activity would enable them to pick up a livelihood where other breeds would starve, especially as, like sheep, they thrive on coarse pasturage which others would refuse. Moreover, their beef would be just the thing for exportation, as its finely marbled character always secures the top prices in the English markets—usually a couple of cents a pound above that of any other breed.

Composting Woolen Waste,

F. G. H., Worcester, Mass., says: "I have a quantity of waste shoddy from a satinet mill, principally wool shoddy. I wish to work it into a compost to fertilize a kitchen garden. What chemicals would be best to mix with the shoddy and old leaves and refuse from the garden, to decompose the wool so as to make it into a fine compost? There are large quantities of this waste shoddy thrown away in this country, and if you could inform your readers how to work it up properly, it would be appreciated. Its effects are excellent, scattered on grass land, but it mats together when used in the garden, so one cannot cultivate easily."

ANS.—Wool waste decays or putrefies slowly, partly because it is greasy, and the treatment it requires is such as will remove the fat. If the material is soaked in putrid urine or manure water, or in milk of lime, the removal is accomplished in part. In the last case where lime is used the fiber is made much more friable. A similar effect is produced by steam under a pressure of three or four atmospheres. We should therefore recommend that if this last process cannot be applied, the shoddy be soaked in thick milk of lime, and then be worked into a compost with the manure of the yard. Some more energetic mixture is needed than old leaves or garden refuse—something that is itself strongly prone to putrefaction. But if no other materials than these can be had for composting, the addition of a moderate quantity of lime to the mixture, the shoddy having been previously itself soaked in milk of lime, may hasten the decomposition. The pile should be kept always moist, but not soaking wet, and should be forked over from time to time to keep it porous and secure free access of air.

Paralysis of the Hindquarters of Pigs.

B. R. W., Ellis, Mo., has a couple of six-months-old pigs that cannot stand on their hind legs, though otherwise they appear to be in good condition and eat heartily; they drag themselves along on their fore legs and cannot use their hindquarters, and he asks for the cause and a remedy.

ANS.—Paralysis of the hindquarters of pigs is due to various causes. If there is a soreness or tenderness on pressure over the loins, it may be due to either a sprain, rheumatism or lumbago. It may also be owing to the presence of a large number of worms in the intestines, coupled with constipation. Diseases of the spinal marrow or its envelopes, scrofula affecting the bony structure and "kidney worms" may all produce weakness of the hindquarters. Owing to the number of different causes to any one of which the ailment may be due, it is hardly possible to prescribe at a distance the best sort of treatment. If owing to worms in the kidneys, Fowler's solution of arsenic may be given in doses of a spoonful morning and evening, every second week for some time. If the cause is not known, it would be well, as a general treatment, to apply over the loins a liniment made of one part of powdered cantharides, two parts of oil of turpentine and two of olive oil. If there is costiveness, give to each pig from one to three drachms of powdered castor-oil seeds and a quarter to half a pound of rye flour mixed in a pint to a quart of sour milk or thin gruel the first thing in the morning, and repeat it once a week, the quantity depending on the age of the pig. Besides this, it would be well to give, twice daily, fifteen grains of powdered camphor, four grains of powdered nux vomica, half a drachm each of powdered aniseed and ginger; mix with a little treacle and rub on the roots of the tongue. Half the dose will be enough for pigs less than three months old. Give sloppy or steamed food and plenty of sour milk. A few sliced raw onions daily in the food are good, and free access to clear drinking water is necessary. A cure in such cases is generally slow and uncertain.

Bee Queries.

E. T., Cleveland, N. Y., asks: 1, the best time in the year to purchase bees; 2. about how many bees in a strong colony; 3. what would be the price per colony with hive; 4. how many pounds of honey per colony for wintering.

ANS. 1. It is safe to purchase any time in Summer. If purchased in April or May one should get strong colonies, and he can afford to pay more for them than later on, as he will get more honey from them. If one purchases bees in the Fall, he should insist on getting them at least one-third cheaper than the regular price in Spring, or else the seller should guarantee that they will winter safely. It is always best to get the bees from some apiarian near at hand. 2. A prosperous colony at the beginning of the swarming season consists of a fertile queen, a few hundred drones and about 40,000 workers. 3. The price will depend somewhat upon the relation of supply and demand; but it will give a fair idea of what it should be, to say that for box hives crowded with black bees—Italians are rarely found in such hives—five dollars per colony are about a fair price. For the same sort of bees in hives such as one may desire to use, eight dollars per colony are a reasonable price. For pure Italians in such hives, ten dollars per colony are not too high a figure. 4. To winter safely each colony should have 30 pounds by weight of good capped honey.

Miscellaneous.

J. H. S., Chelco, Oregon, asks, 1, what sorts of watermelons and muskmelons would be the best for that climate; 2, what is ammoniated bone dust; 3, its cost; 4, how much of it should be put in a hill; 5, is the Canada Victor Tomato earlier than Hathaway's Excelsior.

ANS.—1, We cannot answer this question. The best way is to procure a paper of each advertised in seedsmens' catalogues and plant a few hills of each. We have tried all kinds of melons at our Experiment Grounds. But we have no idea what would thrive best in your very different soil and climate. 2, "Ammoniated bone dust" is the addition of blood or flesh or guano, sulphate of ammonia or some other nitrogenous manures, to bone. Bone (raw) also furnishes some ammonia. 3, About $35 per ton. 4, A tablespoonful would suffice. We should not put it in the hill. It is better to mix it with the soil. 5, There is no difference worth speaking about between them.

G. H., Fountain Green, Del., asks, 1, whether catalpa seeds should be planted this Fall; 2, is the rhododendron hardy in that latitude, and what would be their price?

ANS.—1. Better place the catalpa seeds in boxes of sand and bury the boxes. Plant next Spring. 2. Some rhododendrons are hardy, some are not, for your climate. Try the following:—Lee's Dark Purple, Grandiflorum, Purpureum elegans, Album elegans, Everestianum, Roseum superbum. Rhododendron Catawbiense grows wild from Virginia southward and is very pretty. R. maximum grows in the North and South, westward to Ohio. The varieties first mentioned would cost at retail about one dollar each. Many of the catalogues we shall notice between January and March in our columns will furnish lists and prices.

J. T. H., Catskill, N. Y., says he is going to Maryland to start a small fruit orchard of 2,000 trees with a small capital, and he asks our advice as to selecting the best kinds for the New York market, also the names of a couple of trustworthy nurseryman in that section.

ANS.—The best way to ascertain what fruit to plant in Maryland for the New York market and what will succeed best in the location in which our friend intends to settle, is to visit that neighborhood and make inquiries of the fruit growers there as to the most valuable and profitable kinds to plant. D. S. Myers, Bridgeville, Delaware is a reliable nurseryman and so are the Hoopes Brothers and Thomas, West Chester, Chester Co., Pa.; and so is John Saul, Washington, D. C.

R. H., Circleville, Va., asks 1, how many cows should a fifteen-months-old bull be allowed to serve—would one serving every couple of days be too much; 2, how many ewes a day should a ram serve.

ANS.—1 Once every second day will not be too often for a short season, if the bull is kept in good condition. 2, Four ewes a day would not be too much for a Cotswold or South Down ram properly fed and in good condition; under like circumstances a Merino ram would serve six or eight. Only one serving should be permitted, the ewe being removed immediately thereafter.

L. R. B., Kenyon, O., asks if the one dollar corn sheller advertised in our columns is good for anything—if it is *worth* one dollar.

ANS.—We sent to the agents for one to try, having the tips and butts of a large quantity of corn to shell for seed. It suited us exactly and we would not part with it for considerably more than its cost, if we could not get another.

E. C., Menard, Texas. in the RURAL of Oct. 2, asked the name of an English work on sheep husbandry in Australia and New Zealand.

"Australian," now of Yakima City, Washington Territory, writes us that "The Management of Sheep and Stations," by James C. Jordan, published by Geo. Robertson, 69 Elizabeth Street, Melbourne, is old but good.

J. M. B., N. Y. City, referring to an answer in this Department in our issue of Nov. 6., in which we say—"the grape-vine bears fruit only upon canes of the previous year's growth," asks whether that statement is correct.

ANS.—Yes; it is entirely correct.

E. C. E., Euclid, Minn., asks what is the address of the manufacturers of the Evans rifle.

ANS.—Messrs. Turner & Ross, Boston, Mass., manufacture the Evans rifle, and also deal in other repeating guns of the finest quality.

H. C., Gray's Summit, Mo., asks where he can get seed of the Chester County Mammoth and Blount Corn, and its price.

ANS.—The above is the inquiry of 100 others. In our notices of Spring catalogues we shall give the information desired.

D. T., Brooklyn, Kings Co., L. I. Place them in a dark, airy room or cellar in which the temperature is just above freezing. They may also be kept by burying them in dry, gravelly soil two feet beneath the surface. Others questions will be answered under Domestic Economy.

C. S. S., Rochester, N. Y., asks if H. A. Whittemore, (Fluvanna, N. Y.) whose announcement appears in our columns or did appear last week, is trustworthy and will he send the two pounds of Silver Hulled Buckwheat to each person who subscribers for the RURAL through him?

ANS.—We have known him for many years. He is among the RURAL'S best friends—so, at least, we have always considered him.

S. A. M., Howard Lake, Minn., asks whether the pentstemon is hardy.

ANS.—It is in this climate.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, NOV. 13.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, NOV. 20, 1880.

A WORD BETWEEN THE RURAL AND ITS READERS.

ALL of our agents, friends and readers are invited to send for our Premium Lists, posters and specimen copies. All or any will be sent promptly without charge. *If each one of our subscribers could find it convenient to send us another subscription besides his own, the Rural's circulation would be doubled for* 1881! We respectfully submit that the RURAL NEW-YORKER would be an appropriate and acceptable present to many hard-working, worthy farmers or gardeners who may feel that they cannot themselves afford to subscribe.

We repeat that friendly words spoken now will be more effective than if spoken later when many will have determiued upon their reading matter for another year. The RURAL will appreciate such kind words and endeavor by continued, unremitting work and downright devotion to their interests to prove more valuable to its readers during 1881 than it has proven during any year of its existence. In all sincerity we pledge ourselves to this. Our first aim in the future as it has been in the past will be to elevate the professions of agriculture and horticulture to their legitimate spheres among the industries of mankind; to make them respected by all good, intelligent people and to impress upon the people of our country the fact, which is now quietly ignored, that it is to the American farmer that America owes her present prosperity and greatness. It is quite natural that the RURAL should desire to be foremost—first in this grand work. The *one additional subscription and the friendly word* would greatly aid us in that direction, good readers.

PROBABLY cabbage worms have never been more numerous in many parts of the country than during the present season. Acres upon acres were riddled by them upon Long Island, and it would appear nothing has been discovered, not dangerous to human life, that will destroy them. We saved our own cabbages by going over them and cutting the worms in two with a sharp, pointed pair of scissors. They are so nearly the color of the leaf that it is a trying, wearisome matter to discover them at first, but the eye becomes trained after a while and one is surprised at the rapidity with which at length he is enabled to destroy them.

GREAT BUTTER COWS. — It is quite exhilarating to read the numerous accounts which have for a few months past been given to the papers of the great butter yields of various cows. It began with one pound per day, then rose to two pounds, which were thought quite extraordinary; but this wonder did not last long; for before one could scarcely turn round, the record jumped up to three pounds, then the dairy public began to take breath, and thought it could not be exceeded, when, lo! out jumps four pounds, with the possibility, on the part of one writer, that this will soon be surpassed. It was formerly considered a great thing for a cow to give her weight of milk in a single year; but now comes a race of cows that will produce that weight of butter; and perhaps in course of time double upon it.

BORDERS or trenches for grape-vines are often prepared by digging out the earth, let us say, two feet in depth, four feet in width and of a length depending upon the number of vines to be planted. This trench is then filled-in to the depth of a foot with stable manure and the rest with the good soil taken out of it. It would be far better to throw in the good soil first and finish with the manure. In this case the soil beneath into which the roots would freely penetrate would receive the juices of the manure. In the other case the hard sub-soil, into which the roots should not be encouraged to grow, would receive those juices.

We have often seen garden beds prepared in the same way. But it is in fact a mere waste of labor and manure. The feeding roots of most plants grow near the surface and there is where their food should be most abundant. It is better that the food should go to the roots than that the roots should be obliged to grope for it in all directions through the hard, airless sub-soil.

YIELD OF CHESTER CO. MAMMOTH CORN.

THE Report of Messrs. Dodge & Co., as may be seen by reference to page 767, gives the Chester Co. Mammoth an average of 236 bushels of ears per acre. We find that one bushel of this corn in ears weighs 35 pounds, making 17 quarts of shelled corn weighing 28 pounds, or a total average of 125 bushels of shelled corn per acre. It must appear, therefore, until we are enabled to present our report of the measurement of the entire yield of the field that one acre (the best) of the Chester Co. Mammoth yielded 300 bushels of perfect ears, or over 159 bushels of grain, and that the average yield of the entire field is 125 bushels of grain. The *actual* measurements of the entire fields of both Blount and Chester will be published in our Corn Number.

JUTE.

ONE of the most promising new fields for farming in the Southern States is the cultivation of jute. As a fiber it is largely taking the place of flax and hemp in coarse products, and it is also said to be much used in much finer goods, some of the handsomest carpets being partly of jute. There is no doubt but the demand is to be large and to steadily increase.

A distribution of seeds in the vicinity of St. Louis last Spring, by Professor Waterhouse, of the Washington University, brought two samples of products. One grown by Dr. Shaw, of Shaw's celebrated botanical garden, had no unusual culture and grew to the hight of several feet and produced seed. Another grown by Professor Jenks was six feet and three inches high on October fifth. This specimen had frequent waterings while growing.

Jute is as easily raised as corn, and, planted in March or April it may be harvested in June, July and August, after cotton has been laid and at a time when there is no other special call upon the farm force. The labor of cultivation is light, as its growth is so rank as to overshadow everything else in the field and its yield is simply enormous. There is a very wide field of industry in jute cultivation and one which will eventually be very profitable. The importations of jute during the year ending June 30, 1880, were over $7,000,000, all of which can easily be produced at home.

INCREASE IN THE MANUFACTURE AND CONSUMPTION OF WOOLEN GOODS.

ANOTHER great encouragement for flock-masters to add to the numbers of their sheep as fast as possible, is the rapid increase of woolen manufactories in our country for twenty years past, and the cheapening and improvement of their fabrics. The consequence is an unprecedented demand, especially for underclothing. Seventy years ago, linen fabrics were almost the only ones used for this purpose and also many household purposes. Sixty years ago, when cotton manufactories had been established to some extent, their fabrics began to take the place of linen; and now for 20 years past the use of woolen goods has been rapidly superseding in many instances both linen and cotton.

This change is highly gratifying, as woolen garments are much the most healthful, even in hot climates, and should be worn in our own, Summer as well as Winter, particularly those next the skin, when they can be borne with comfort. They absorb the perspiration of the body more freely, and guard it against sudden chills and rheumatism. All who wear woolen under-clothing are not nearly so liable to take those severe colds which are almost certain to bring on other ailments more or less dangerous.

Close observation of the medical faculty for some years past, substantiates the above. It is found particularly the case with travelers, sailors and soldiers, who are so much exposed to sudden changes of the weather at all times by night as well as by day and also to sudden changes of climate. Woolen under-clothing may be found irritating and uncomfortable at first to a very sensitive skin. In this case adopt such as is fabricated of a mixture of cotton and wool, and after getting well accustomed to that, change for pure wool.

The fleeces of our flocks have been so varied and improved within 50 years past, as to furnish nearly all the sorts necessary for the manufacture of thick goods for blankets and men's wear, and also for the finer dress goods of ladies and children's under and over garments. These different qualities of wool can be easily multiplied now to any extent, and the manufacturers have only to express their desires to the flock-masters to insure their being rapidly fulfilled.

A NEW SENSATION.

A SENSATIONAL story is in circulation, to the effect that butter which has been adulterated with soapstone has been sent from Western cities to New York for sale; and that some Western farmers have purchased the soapstone finely ground, by the barrel, for the purpose of mixing it with their butter. This story is a transparent fraud beyond a doubt. What its object may be, for it has an object certainly, is difficult to comprehend, unless it be an attack upon the reputation of Western butter. That it is without good basis may easily be proved by any person who knows what soapstone is, or who will procure some and try for himself if he can add 20 per cent. in weight of it, that is, 10 pounds to 50 pounds of butter, or even more, as it is charged, without easy detection by the taste or sight. As a test we have reduced to the finest powder a specimen of the soapstone from the locality mentioned, Philadelphia—the quarries are within a few miles of that city and known to us—and have mixed it with five times its weight in butter. The mineral is left upon the tongue as the butter dissolves and is gritty to the teeth. Its peculiar, pearly glistening appearance and silvery whiteness are also distinctly visible to the unaided eye, and under a common pocket lens are plainly visible. The author of this remarkable "*canard*" is the victim of a hoax or is himself the author of what Artemus Ward once wrote as a "goak," or perhaps worse. Western butter is at the head of the market and has attained its well deserved position by its merits and in spite of difficulties and prejudices. Western dairymen are not fools. Having an excellent reputation which is highly profitable to them, they are wise enough to retain it in the only way that is possible. No doubt soapstone may have been used for adulterating lard, and that it can be so used without easy detection, and lard is notoriously subjected to adulteration with various cheap or valueless matters, such as water, for one, by certain manipulations. It may be, too, that the lowest grades of butter, that have been "milled," as it is called, and which are sold for cooking purposes only, may have been mixed with lard so adulterated. This is possible. But that good butter can be so adulterated or is likely to be, is not true; it is, in fact, beyond possibility, without easy detection. If any reader has been disturbed by this false, sensational story; let him rest in peace. If we felt inclined to be jocular over this matter, we should say that all this soapstone business is nothing but talc anyhow.

BREVITIES.

MR. PURDY deems the Worden one of our most valuable *early* grapes for the million. This is much like the Concord.

IF children must eat candy, let it be Rock Candy. All others are liable to have been adulterated with glucose or something worse.

GLUCOSE is defined in a recent French paper as follows:—"Glucose—a product with which wine is manufactured without grapes, cider without apples and confectionery without sugar."

MR. SIDNEY in his able work says: "The beauty of the cart horse depends not on fine quality or delicate symmetry, but on a sort of elephantine ponderosity that bespeaks power in every muscle and in every limb."

"WHAT pear shown at this meeting is as good, all things considered, as Beurre d'Anjou?" was asked at the last meeting of the Western New York Horticultural Society. Pres. Barry answered—"None. Anjou is the best pear in the world."

COL. WARREN, the editor of the California Farmer, lately enjoyed a dinner prepared by several friends in honor of his 75th birthday. In 1854 he established his journal and has done more, probably, than any other person to develop the agriculture of his State.

A WELL known agricultural writer and editor makes this remark in a private letter to the RURAL: "Now I hope for four years of peace and prosperity—glad in my whole heart election is over. I detest this political wrangling and the slanders of either party."

MESSRS. READ & PELL in their report of agricultural matters in America, use several odd words respecting corn. In one part they speak of corn-shellers for "stripping the grain from the core." In another they allude to the value of the "green cobs for the table."

NOTWITHSTANDING the great yield of grapes all over the country the past season, there was not one day when Concords were sold in New York city at retail for less than six cents per pound—full weight. And yet many of the growers sold their entire crops for less than two cents per pound!

A FEW days ago we saw a Hercules's Club at the office of Thorburn & Co. of this city. It was three feet and ten inches in length. There was nothing very extraordinary about this, but we were informed that the seed from which this gourd was grown was brought from Patagonia by the Wilkes's Expedition in 1834. Thus, it will be seen, the seed was not less than 46 years old.

WE would advise our readers for the latitude of Philadelphia and north of it, who received the Cuthbert Raspberry, to cover the earth about the stems for a distance of two feet with barnyard manure. Those living south of Philadelphia might better wait until the first freeze. This mulch will tend to prevent sudden freezings and thawings, and in this way help the roots as well as by furnishing ready food when Spring arrives.

THE editor of the Chicago Weekly Tribune, commenting upon our corn yield, says: "There is nothing remarkable in the yield, and we only call attention to it as an illustration of what a little extra manure and work will do for a crop of corn in a climate and soil not nearly so favorable as ours for its growth." We beg to state there is a good deal that is remarkable in the yield and that instead of "extra manure," a comparatively small quantity was used.

WHAT trees to plant about the home—what shrubs? These questions we shall endeavor to answer in our Tree and Shrub special number of the RURAL NEW-YORKER, to be issued before the Spring planting season arrives. We shall endeavor to give all needed information regarding the subjects treated. At the Rural Grounds we have over two acres of land in ornamental trees and shrubs, scarcely any two of which are alike, and we shall commend only those which have proven hardy and the finest of their class.

OUR occasional contributor, Prof. Sheldon, who has been visiting Canada (we regret he did not favor us), writes to the Live Stock Journal respecting the Canada methods of raising corn for soiling and for hay. He concludes: "Now, it appears to me that in the warmer parts of Britain, and on good soil, this corn would be found very useful to dairy farmers as a staple green crop for soiling; in any case, it would do to use by way of variety among other crops." We would suggest Blount's White Prolific as an excellent kind for the purpose.

COL. WILDER writes us: "I am glad that you keep up the illustrations of American grapes. We are making grand additions to our list and the time will come when we shall have grapes, wines and raisins to compete with the world. So I said in my former addresses, in my Report of the Paris Exposition, 1867, and other places. We can scarcely begin to estimate the results which are to arise from the capability of our wide range of territory and climate. Think, for example, of the great North-west equal in fertility and salubrity to California—a territory equal to 22 States like Ohio—soon to be occupied by the swarming millions going west.

DOUBLE FLOWERS.—In a communication to the Academie des Sciences, M. Heckel attributes the formation of double flowers (from the replacement of stamens by petals) to long-continued self-fertilization, and he proves his statement by adducing the results of some experiments made by him on Convolvulus arvensis, wherein he effected self-fertilization for three generations, and in the third succeeded in producing double flowers.

According to this philosophy, one would suppose that all cleistogamous flowers, as, for example, the Closed Gentian, would become double, which is far from the fact. It is our impression that the Cardinal Flower and also L. syphilitica are self-fertilizing. We have never heard of a double flower of either. It might be supposed, also, that oats and wheat would long ago have become sterile through doubling up.

THE exports of flour from this country are increasing even more rapidly than those of wheat, and it would seem that the day is not far distant when a large proportion of the wheat crop will be sent abroad in the shape of flour, thus securing to our own working classes the labor of milling. For some time back, English millers have felt the competition, and now a wail on the same subject comes from Hungary. The yellowish, adhesive Hungarian flower has long held a front rank in Europe where it found customers at high figures in Great Britain, France, Germany and Switzerland. A few years ago, in view of demand for the article, a large number of new mills were built at Pesth and other points, but so great has been the falling off of late in this trade that many of these are now idle, while others are forced, in order to compete in prices with our product, to make lower grades of flour, thus endangering the reputation which gave rise to the demand for their goods. Although American flour is not yet considered quite so good as Hungarian, still it is confessedly so fine and can be placed on the market so much cheaper, that it is fast driving its rival out of the markets of Great Britain, France Switzerland and some parts of Germany.

Literary Miscellany.

WHAT TEMPERANCE DID.

My story, marm? Well, really, now, I have not much to say;
But if you'd called a year ago and then again to day,
No need of words to tell you, marm, for your own eyes could see
How much the Temperance Cause has done for my dear John and me.

A year ago we hadn't flour to make a batch of bread,
And many a night these little ones went supperless to bed;
Now look into the larder, marm,—there's sugar, flour and tea;
And that is what the Temperance Cause has done for John and me.

The pail that holds the butter, John used to fill with beer;
But he hasn't spent a cent for drink for two months and a year;
He pays his debts, is strong and well as any man can be;
And that is what the Temperance Cause has done for John and me.

He used to sneak along the streets, feeling so mean and low,
And he didn't like to meet the folks he used to know;
But now he looks them in the face, and steps off bold and free;
And this is what the Temperance Cause has done for John and me.

A year ago these little boys went strolling through the streets,
With scarcely clothing on their backs, and nothing on their feet;
But now they've shoes and stockings and garments as you see;
And that is what the Temperance Cause has done for John and me.

The children were afraid of him—his coming stopped their play;
But now when supper time is o'er, and the table cleared away,
The boys all frolic around his chair, the baby climbs his knee;
And this is what the Temperance Cause has done for John and me.

Ah, those sad days are over of sorrow and of pain;
The children have their father back, and I my John again!
I pray excuse my weeping, marm—they're tears of joy, to see
How much the Temperance Cause has done for my dear John and me.

Each morning when he goes to work, I upward look and say;
"Oh, Heavenly Father, help dear John to keep his pledge to-day?"
And every night before I sleep, thank God on bended knee,
For what the Temperance Cause has done for my dear John and me.

INMATES OF LESTER HALL.

(Continued from page 757.)

CHAPTER XVIII.

Mr. Daton smiled, and began to read Mattie's letter to Cecil:

"MY DEAR UNCLE HENRY:

"I hope neither you nor Cecil have been anxious at my silence; but in case you have, I will begin my epistle by assuring you that I am quite well, that Edgar is quite well, and that you should have had a letter before if I had not waited until I could give you some definite tidings about something which has interested us greatly during the last few days——"

"What can that be?" interrupted Cecil, from her seat by the fire, a little curiously.

Her uncle continued:

"You know under what deep obligations to Dr. Carewe we both lie; and you will, I am sure, be glad to hear that we have been able to be of some slight service to him here. As the tale concerns us nearly, I will give it you in detail."

(As the reading continued, a faint color had risen in Cecil's face, and at the mention of Dr. Carewe's name a sudden interest had lighted up the great brown eyes, and made the tender, mobile lips quiver.)

"It is altogether so strange and so sad a story," continued Mr. Daton, reading off the closely-written pages of Mattie's letter, "that I hardly know how to begin it. Edgar would tell it better than I can do, but he has been obliged to go out on business connected with it, and do not wish that there should be any further delay. You will remember that when I last wrote we were going to spend a day or two at Monaco, as we were both curious to see the mysteries of the gambling saloons—at least I was—for Edgar had been there already. I will not enlarge on what we saw—it was a brilliant but a very sad sight; the eager, haggard faces, some flushed with triumph, others white with despair. While we were there a gentleman rose from one of the tables, and as he was about to leave the room, caught sight of Edgar, paused irresolutely for a moment, then came up to us.

"'You are Mr. Edgar, I believe?' he said, abruptly, and when my husband had answered in the affirmative, he went on quickly:

"'Am I mistaken in supposing that you are acquainted with a man named Carewe—a doctor, I believe?'

"'You are not mistaken,' said Edgar. 'Lawrence Carewe is one of my best friends.'"

"'You know his whereabouts?'

"'Certainly,' replied Edgar, in some surprise.

"'Then,' pursued the stranger, 'you can send him word that if he wants to see his brother alive, he had better lose no time in making his way here for his hours are numbered.'

"'His brother!' exclaimed Edgar. 'Do you mean Lionel Carewe?'

"Yes."

"'He is here—and ill?" said my husband;

"'Can you give me his address?"

"'There it is.'

"He wrote a few words on a card, gave it to Edgar, bowed, and walked away. When we examined the card, we found that the address given was that of the hotel where we were staying, so we drove back at once and made inquiries. The proprietor told us that a man named Carewe was there—very ill, dying, and in great distress, having lost everything at the gambling-tables.

"'I let him stay here out of charity,' he added, with a shrug of his shoulders. 'He would give no address of his friends; he said he had none, and only wanted to die in peace.' We asked if a doctor had seen him. 'Oh yes,' was the reply, 'but he said nothing could be done for him.'

"'Can we see him?' asked Edgar, feeling rather indignant at the man's manner.

"'Certainly, if monsieur wishes, but he is in a room at the top of the hotel. Miladi will not care to climb so high.'

"'Will you come, Mattie?' Edgar asked me, and of course I said, 'Yes;' so we went up together and found the poor fellow in a wretched attic at the top of the house. He was lying on the bed fully dressed; he had fallen there in a kind of stupor, on his return from that hateful Casino, and there he had laid for three long days and nights, dying, his only attendant one of the under-servants at the hotel, who came to him in her spare moments. He was lying with closed eyes when we entered, his breath coming in faint gasps, and his face awfully worn and emaciated; but Edgar knew him at once, and whispered to me, 'It is Lionel Carewe, Lawrence's brother.' Soft as the whisper had been he heard it, and opening his eyes, stared wildly at us.

"'Lawrence,' he said feebly, 'who talks of Lawrence—poor Lawrence?' My husband went up to the bedside, and bending down, spoke to him gently and soothingly, and a gleam of consciousness came into his eyes.

"'Don't send for Lawrence,' he said, faintly. 'He can do no good—I am dying; my hours are numbered now. He could not get here in time,—and it would grieve him.'

"'Your brother would wish to be sent for, I am sure,' said Edgar, earnestly. 'Let me telegraph for him, and meanwhile if we can be of any service to you, it will give us great happiness—my wife and I.'

"'Your wife?' he repeated, glancing over at me. 'Is that your wife? Her face—I know it. What is her name?'

"'Mattie Edgar now; it was Mattie Lester,' said Edgar, as I drew near.

"'Lester,' he repeated, with a start. 'Had she a brother Rex.? Poor Rex. Lester!'

"His mind seemed to wander again for a moment. We were just debating what we should do when he began again: 'He is dead,' he muttered. 'He said I had led him on to ruin. Lawrence tried to help him. Ah! how my head burns. Red, did you say red? and I laid on black. Ah! I have lost!'

"He fell back exhausted and panting, and I remembered then that dear Rex. when he was dying, had complained bitterly of some one who had led him into error, and I knew that this must be the man he meant. It was very distressing to hear his mournful ravings, but we procured him every assistance in our power and medical advice, and we telegraphed for his brother. For a few hours he lingered, then just at the last he regained consciousness and recognized Edgar. 'It is a fitting end for such a life as mine,' he said, sorrowfully. 'Poor Lawrence did all he could to reclaim me; he has been so good, but it was no use. Well, it is over now.' Then he told us his story brokenly and at intervals, the old, old story of folly and sin, of his terrible downfall, how he had gone from bad to worse, how he had succumbed entirely to his passion for gambling, how he had lost everything—honor, health, and reputation. He asked us questions about Lawrence; he seemed glad to know that he was rising so rapidly in his profession, and then he would lie back exhausted and fainting and we thought the end was near. Once he spoke to me, asked me to forgive him for the wrong he had done to Rex.; and when I told him that I owed my life to his brother's skill and care, he seemed pleased, and said, feebly, 'That Lawrence, poor fellow, had always to atone for his sins.' Then he thanked us for our goodness—it was so little we could do, that the words made our hearts ache—and gave us some last messages to his brother; but I am thankful to say that Dr. Carewe came in time to see him. It was evening when he came, and Edgar and I were with him; he was dying, and his weakness was extreme; but his face lighted up as his brother came in and knelt down by the bedside.

"'Lionel,' he said, softly. 'Dear old fellow, do you know me?'

"'Yes—I am glad—you forgive me, Lawrence,' came brokenly from his lips. Then his eyes closed, a shiver ran through him, and all was over. Edgar took me out of the room then; but I caught one glimpse of Lawrence Carewe's face, and I could guess how deep had been his affection for his unhappy brother. Dr. Carewe stayed for the funeral, which took place on the second day after the death. He feels this very acutely, and looks wretchedly ill; still I think it must be a relief to him to know that 'after life's fitful fever' his brother sleeps well. If you can do anything, dear uncle, I know you will—he has been such a true friend to us that I should be only too glad if we could repay our great debt of gratitude in any measure. When you go up to town, do call. Cecil will be able to tell you what passed between her and our dear brother on his deathbed, which will explain to you the remorse which poor Lionel Carewe felt when he was dying.

"Give her our love, and kind regards to Ernest. I hope you are both well, and that Cecil is having some good gallops over the Downs. Write to us, both of you, soon, and tell us all home news. We are not tired of our *exile* yet, but we often talk of you and wish we could have a glimpse of you.

"Ever, dear Uncle Henry,
"Your loving niece,
"MATTIE EDGAR."

The long epistle had reached its end at last, and Mr. Daton replaced it in its envelope.

"Poor Lawrence," he said, sorrowfully. "Poor lad, he was so fond of that ne'er-do-well brother. I shall never forget how he came to me to plead Rex.'s cause, and how deeply he felt that his brother had led him astray."

There was no answer from Cecil, but Mr. Daton did not seem to expect any, and in a moment he spoke again.

"I suppose there is nothing we can do to help him over his trouble, Cecil?" he said, wistfully; but there was no reply.

He rose hastily from his seat, and came round so that he could see her face. It was lying back on the cushions of her chair, white and still, with dilated eyes.

"Cecil," he said, gently, touching her shoulder—"Cecil, speak to me, dear."

She looked at him in silence, with unspeakable misery in her glance.

"Cecil, are you ill, my child?" he asked, bending tenderly over her.

"Ill?" she said, feebly. "No; I—am—not—ill."

The words were spoken with an effort, and a pause between each; she tried to rise, putting her hand up to her brow with a gesture of pain; then she fell back, her eyes closed—Cecil Lester had fainted away.

CHAPTER XIX.

PENITENCE.

"CECIL, what is the matter with you, dear? You look anything but like yourself, and your pale face makes me quite anxious."

Cecil Lester and Mr. Eleston are standing in the dining room waiting for the horses to be brought round for their morning ride, and Cecil is ready. She wears her hat and closely-fitting dark green habit; in one hand she carries her whip—a dainty jewelled toy; the other lies passively in her lover's as he stands beside her, looking down with a shade of trouble in his pleasant blue eyes, on the beautiful face which looks so pale and so grave in the bright morning sunshine.

"Anxious," echoes Cecil, with a little smile, which is sad enough not to reassure him. "There is no need for anxiety, Ernest; I am always pale in the morning, you know!"

"Are you, my darling!" he says, fondly. "I don't like it though; I like to see you with your pretty color in your cheeks."

"It will soon come when we have had a canter over the Downs," she answers him, a little wearily. "You are only too kind and too careful about me, Ernest."

"Too careful of you, my darling?" he says, fondly," "How could that be?" I love you—do you know what that means, Cecil—I love you?"

She shivers slightly as she listens, but suffers him to draw her to him with fond tenderness.

"There are the horses, Ernest," she says in a moment, rousing herself and lifting her fair head from its resting place against his shoulder. "We will go and have a good gallop, and disperse all these blue imps which are troubling me."

"Where shall we go?" asks Mr. Eleston, as he gets into his saddle. "Will the Downs be too cold for you this morning, Cecil?"

"Not a bit; there is no other place where we can have such a good gallop," she answers, warmly. "I feel like riding this morning, Ernest, so I hope you are in the humor."

"When am I not in the humor for riding?" he answers, laughing, as they canter away.

But Cecil's enthusiasm soon fails her, and after an hour's good scamper over the Downs she declares her self tired, and Ernest instantly acquiesces. As they ride slowly homeward, he notices that the pretty rose-flush which the keen air blowing over the Downs has brought into her cheeks has faded again, and that the beautiful face looks pale and grave.

"I don't think I will put in an appearance at luncheon," she says, forcing a laugh. "My head aches. I will go and lie down. Excuse me to Uncle Henry, Ernest."

"Yes, love," he answers, ruefully. "But, Cecil, how shall I get through the afternoon without you?"

"As best you can," she answers, smiling; then, as if to atone for the careless speech, she lifts her face to his, and he stoops and kisses her fondly on the forehead.

"Your head is very hot, and your hands are very cold, my darling," he says, anxiously. "I think you must be ill, Cecil."

"I shall be quite well by-and-by," she replies, as she goes up-stairs, and he stands in the hall, watching the graceful figure until it disappears, when he sighs and goes in to his own luncheon, troubled, dissatisfied, but trying in his loyalty to Cecil to dismiss the feeling.

The week which had elapsed since Mattie's letter awakened her to a knowledge of the great error she had committed in thinking of Lawrence Carewe as the man who had been the ruin of her brother, has been a time of acute misery, of unutterable agony. That she had failed in her vengeance she heeded little. Who could read the description of the miserable fate of the reckless, dissolute gambler, who was Lawrence Carewe's brother, and feel anger towards him for his misdeeds? He had been sufficiently punished without her intervention; but when she looked back upon the past, her heart was filled with the bitterest agony and self-reproach. She remembered how she had striven, how she had used all the fascination of her great beauty to win the heart of Lawrence Carewe, and how entirely she had succeeded; how, when he had declared that love to her, she had repulsed it with contempt and scorn, and revealed to him the cruel purpose which she had cherished. How could she atone?

Cecil rose from her chair, and began pacing up and down the room with quick, restless steps. How could she atone? How—how? She could not atone, she thought, wearily, but could she not win forgiveness? Surely, if she confessed, and told him how sorry she was, he would forgive; he was so generous and so noble he would not cherish resentment against her.

"Oh, my darling, my darling," Cecil said, half aloud, as she sank into her seat again. "You will forgive me."

"My darling"—the words had escaped her lips unconsciously, involuntarily, and as she remembered, a burning blush covered her face from her white throat to the roots of her bronze-brown hair, and she hid her face on her hands with a movement of such pretty shyness and shame that it was a pity no one was present to enjoy it; but the hot flush soon faded, the fingers fell from before her face, and showed it white, cold and mournful.

Then as her hands fell on her lap, the gleam of the great flashing diamond—the outward sign of her engagement to Mr. Eleston—caught her eye, and a sob broke from her lips. She had forgotten him; her whole thought had been for Lawrence Carewe; her own suffering—and she suffered as a woman of a strong, passionate temperament only can suffer—was unheeded. She could only think of the man who had suffered so cruelly through his love for her, through the nobility which had never doubted her, and even when he knew all had never reproached her. He was her only remembrance as she lay there; he—Lawrence Carewe—who had suffered a martyrdom through her.

She loved him; she did not attempt to blind herself to that fact; it would have been useless trying—she loved with a strength which she herself hardly fathomed—a power which would have made her suffer any doom, could she have given him back his peace, have obliterated her image from his heart! But was that possible? Ay, perhaps such a blow as she had dealt him might have killed his love for ever, but he would forgive her. She had that hope still, and when she had his forgiveness she could bear the rest.

She opened her writing-table, and dipped her pen into the ink. She meant to write to him; she dared not see him to ask his pardon, now that her loyalty and her allegiance belonged to another—but she would write. She drew the paper towards her, and sat for some minutes lost in thought; then she began to write, and her pen coursed rapidly over the paper until she had finished the note It was a brief one, but Cecil had not dared to make it longer, and the few lines she had written were cold compared to the passion at her heart. They were as follows:

"Perhaps when you see the name signing this letter you will cast it aside with contempt; but even if you do so I cannot help it. I have heard from Mattie the bitter mistake I made. Can you forgive me? I know this is asking much from you! I think it is asking what I myself in your place would not grant; but great as my sin was—my repentance has been as great—let that plead for me! I am very unhappy. Forgive and pity!

"CECIL LESTER."

That was all she had written, and the paper lay open before her for a minute or two; then she stooped and put her lips passionately to the senseless paper.

"He will touch you," she said, softly, "He will hold you in his hands—happy paper!"

"Only to know him happy," she said, pitifully "only that! I could bear the rest."

Very flushed and feverish was Cecil that night when she went down to dinner, with a bright hectic flush on each cheek, and a strange feverish lustre in her beautiful eyes. Her manner, too, was unusually fitful—she was petulant, and the next minute she atoned for that petulance with a gracious sweetness all her own—she was gay, and the next moment there would be tears in the sweet, slumbrous brown eyes. Her uncle and her lover looked at her anxiously, she seemed so strangely unlike herself; and when—earlier than her wont—she bade them good night, Ernest followed her to the door with wistful tenderness, which brought a quiver to her lip.

The next evening, when she was dressing for dinner, the answer to her note was brought to her. One glance at the black-edged envelope told her from whom it came, and her fingers trembled as she took it and laid it unopened on the dressing-table, waiting until she was alone. Lisette was unusually long over her operations that evening. It was true that there was a dinner-party that night, and therefore an elaborate toilet was necessary, according to Lisette's notions; but Cecil thought that she had never been so long before, and at last dismissed her with an impatience which was unusual to her.

Then her mistress took up the letter, holding it tenderly in her unsteady fingers, touching it passionately with her lips, hardly daring to break the seal, longing, yet dreading to open it. When she mustered courage to do so, she saw that the answer was even more brief than her letter, and a film passed before her eyes.

"The wrong, the injury were beyond all forgiveness," she said, faintly. "Dare I read?"

"You ask me to forgive," wrote Lawrence Carewe. "I would have forgiven you death itself. I can forgive your error; but if ever it should happen to you to be loved again as I loved you, remember my misery and be pitiful."

The answer was a generous one, but it cut Cecil to the heart, this was the heart she had lacerated—this the love she had betrayed. Very pale and grave was her face as she put the paper away in that secret drawer of her dressing-case, where the other paper had been hidden so long; but when she went down stairs there was a softness in her manner which Mr. Eleston had never known, and which made him very happy.

"I really think you love me a little Cecil," he whispered fondly once, and she gave him her hand and smiled, but she did not look at him, so that he did not see the misery in her eyes. He little knew that she was trying, poor child! to atone to hi for the wrong done to another—to be "pitiful."

CHAPTER XX.

CHRISTMAS-TIME.

It is drawing near Christmas-time. The weather is bitterly cold, but Mr. Daton and his niece still linger in Brighton; and on a fine, frosty December morning Cecil is sitting in the library, with half a dozen letters before her, debating with Mrs. Audley which of their many invitations to spend Christmas they would accept.

"I don't think it is very pleasant running from house to house," said Cecil, rather discontentedly. "Uncle Henry does not like it; so we can only accept two. Mrs. Brayburn, you see, asks us for three weeks, and Mrs. Walsh for three more; and as those two time each other very well, I suppose we had better accept them. By that time," added Cecil, her eyes brightening at the thought, "Edgar and Mattie will be thinking of turning their faces homeward, and we shall want to be at home to receive them. I think I will write and accept these, Mrs. Audley."

"Well dear, of course you know best," said Mrs. Audley, placidly. "But before you accept, don't you think it will be prudent to find out if Mr. Elesston is invited?"

Cecil's face flushed slightly—the beautiful, weary face, which had a trick of looking so sad when in repose—and her red lip curled.

"I really don't see that it is necessary for Ernest to be with me wherever I go," she said, a little coldly. "I think there is nothing more unpleasant than for an engaged couple to be always thrown together for people to make remarks upon."

"Hallo! what treason are you giving vent to, Queen Cecil?" said a gay voice behind them.

And Cecil turned to the door, where Ernest was standing.

"Good morning, Mrs. Audley," he said, as he entered the room and shook hands with that lady. "Good morning, my darling," he added, lowering his voice, as Cecil gave him her hand. "How are you this morning?"

"Quite well—I am always well," she answered, a little wearily. "When did you ever know me to have anything the matter with me? I am one of those people who never have a toothache, and who live to be a hundred!"

"I am delighted to hear it!" he said, laughing. "I am in no hurry to get rid of you yet."

"Are you not? Ah, well, never mind, you'll be tired of me soon enough!" she said, gaily.

"I am quite willing to risk that!" he said, laughing, but looking at her with a very fond light in his blue eyes. "But what important discussion did I interrupt?" he went on, as Mrs. Audley rose, and gathering up her silks and wools, prepared to vacate the library. "Don't let me drive you away, Mrs. Audley."

"I have some letters to write," said Mrs. Audley, who was getting a little tired of "holding the gooseberry-bush."

"Mrs. Audley has a perfect idea of her duties," he said laughingly, as he looked down at his *fiancée*. "What called for that remark about engaged couples which fell upon my ears?"

"We were talking about the Christmas invitations, and Mrs. Audley was saying that I ought not to accept any without knowing whether you had received an invitation to the same houses," answered Cecil.

"Heaven bless the old lady for looking after my interests!" said he, cordially, as he sat down on a stool at Cecil's feet, and took her jewelled hand into his, too much in earnest in himself to note that the small fingers gave him no answering pressure, but lay passive in his grasp. "What would she like for her Christmas gift?"

Cecil smiled languidly, but made no reply. Looking down at the proud blonde head, the handsome, animated face turned up to hers, her heart ached to think how little love she had to give him in return for the passionate devotion he laid at her feet, the vision of another face, much less handsome, but full of proud power, was before her.

"Where do you intend to spend Christmas, Ernest?" she said, gently, in a moment.

"Wherever you do."

"That is satisfactory," she replied, with a slight laugh. "But if you are not asked?"

"I should go all the same!"

"In what capacity?"

"Your uncle's servant, if I could not get admission under any other terms!" he replied.

"Foolish boy!" she said, lightly.

"Am I foolish!" he replied, half sadly. "Well, never mind, Cecil. No one suffers for my folly but myself."

"And do you suffer for it?" she asked, leaning forward. "Ernest, do I make you unhappy?"

"You!" he answered, fondly. "Do you want to see the happiest man in England? If so, here he sits at your feet!"

"What makes you happy?" said Cecil, half smilingly, half sadly. "Because you have made the worst bargain ever a foolish man made?"

"The worst! Look at yourself in the glass, my Cecil, and repeat that remark if you dare!"

"Do you think it is a good bargain because of my pretty looks?" she said, sorrowfully, "They will not last long; but if you are content, I must not complain. If you are willing to take such a worthless woman into your life——"

"Cecil, how dare you? You are mine now, and no one shall disparage my property!" he said, with tender indignation, an uncomfortable misgiving striking him as he looked at the beautiful face, the sad eyes, and felt how the hand lying in his burned. "Is anything grieving you?"

"Grieving me!" Cecil replied, with a start. "What should grieve me, Ernest? If you are the happiest man, am not I the happiest woman? Have I not reason to be? Have I not wealth, position, beauty, and the truest lover?"

She put her hand for a moment on the curling fair hair with a gentle touch, which dispersed all Ernest's anxiety and raised him to his former state of bliss.

"But, Ernest, really you know it is not quite imperative that we should be visiting at the same houses," Cecil said, in a few moments. "We surely need not present that pitiable spectacle of an engaged couple to all our friends. You know a man in that position is really a sad sight! He is just as if he were mounted on a stool of repentance for some misdeed!"

"I don't much care what I look like, Cecil," he answered, good-humoredly, "so long as I am near you. Besides, I shall only meet looks of envy, and hear people wondering, as well they may, what have I done to be so blessed—what the beautiful Miss Lester can see in Mr. Ernest Elesston."

"What can I see!" she echoed, laughingly. "Why, Ernest, are you not rich, and handsome, and clever? Are not those sufficient reasons?"

"Undoubtedly!" he answers, laughing also with some pain in his face.

"Well, then, where is the cause for surprise?" she asked him, gaily. "Don't you think that Cecil Lester, whose face, such as it is, is her fortune, is a very lucky woman to have won one of the great matrimonial prizes of the season?"

"Don't talk so," he said, quickly, the pain which was on his face reaching his voice. "It hurts me, Cecil!"

"I am sorry. Forgive me!" she said gently, and slipped her hand caressingly into his.

"Now to business," she went on, in a moment. "Where do you intend to spend Christmas?"

"Well, of course, under ordinary circumstances, I—and I hope you, too, Cecil—would have spent them at home. I so want you to know my mother but you see Ida's health unfortunately keeps them abroad."

"That is no answer to my question, Ernest," Cecil said, a little impatiently.

"Patience," he said, as he fumbled in his coat pocket, took out some four or five unopened letters and threw them on to her lap. "There, Cecil, read those and decide."

"But, Ernest, they are all unopened! They may not all be invitations," Cecil said, demurely, with a glance at him. "And they are all directed in feminine calligraphies."

"You may freely open them," he said, proudly. "Cecil, do you think I would——"

"Deceive me? Oh! dear no. But, Ernest, engaged though we be, I should not like you to read all my letters."

"That is different," he said, but half sadly. "You have never told me you loved me, Cecil."

She put her hand over his for a moment with a sudden little gesture of remorse and self-reproach. Ernest bent down, and touched it with his lips softly; and without further comment Cecil began to open the letters.

"Yes," she said at last, when she had completed her task; "it is all right. You have invitations for the same date as ours. We are going to accept those two, so if you like, Ernest, we will go together."

"If I like, Cecil!" he said, smiling. "Who would not like? But, darling child, don't you think it would have been ever so much pleasanter to keep Christmas quietly at home—just you and Mr. Daton and myself."

"Christmas at home—what a terrible idea!" said Cecil, with a slight shudder. "It is such a sad time at best, that——"

"Sad!" repeated Ernest, in amaze. "Why Christmas ought to be a very jolly time."

"It ought to be, but is it? All one's sad thoughts come at Christmas-time."

"I wonder what sad thoughts you ever have, Queen Cecil?" he said, caressingly. "Your life has been all brightness, has it not?"

"Do you think so? Have I never told you of my lonely childhood and girlhood," said Cecil, gently "nor of my brother's death? Poor Ernest, you love a stranger, not the true Cecil!"

And then she told him, softly, about her brother's death, and of her vow of vengeance; but, although she told him of Lionel Carewe's sad death at Monaco, she did not tell him of her revenge on his brother. Lawrence Carewe's name never passed her lips unless she were obliged to speak of it; but as Ernest watched her he wondered at the heavy trouble which made the sweet lips quiver.

"Do not talk of it any more, my dearest," he said, tenderly. "Trouble shall have no part in your future life, Cecil, if I can keep it from you."

And as Cecil listened to his tender words, and looked into the true, honest eyes raised to hers, her heart smote her bitterly.—To be continued.

NEW PUBLICATIONS.

Song Bells—By L. O. EMERSON.—A Music Book for Common Schools and Juvenile Singing Classes. Boston: Published by Oliver Ditson & Co.

Song Bells has 216 pages, of which about 50 are devoted to the "elements," 36 pages to easy and pretty melodies in all the usual keys, 104 pages to the usual school songs, including some unusually popular ones, as "Blue Alsatian Mountains," "Nancy Lee," and "Twickenham Ferry," after which 20 pages contain sacred music for opening and closing. "Graded" singing books are now in use in a number of cities and towns, but a genial general collection like this is not out of place even there; as an extra book, while it is just the thing for thousands of schools that are but partially graded.

It is quite a number of years since Mr. Emerson has favored the boys and girls with one of his new genial and well-selected collections of school songs. Excellent new graded singing books are now much in use; but there is about as much need as ever of good general collections in which songs of the kind that attract the public favor may be inserted, without any arrangements to difficulty.

The Welcome Chorus—A Song-Book for High Schools, Academies and Seminaries. By W. S. TILDEN. Boston: Published by Oliver Ditson & Co.

The first thing noticeable in connection with this "welcome" book is the graceful title, which is ornamented with a view of a high school building. On opening the book we find a well-arranged interior. There is an elementary course, a little high-toned for a grammar scholar, but just about right for the young lady or gentleman who is to use the book. Now that better times in musical matters are at hand, principals and teachers will be interested in examining the new book, whose author has had a hand in two others, and who evidently is master of his vocation. The Welcome Chorus commences with a sort of *high* elementary course, which is followed by quite a large division containing sacred music for opening and closing exercises, and for practice. After this the rest of the book (or 150 pages) is filled with appropriate glees or part-songs, arranged in four parts. It is understood that beginners may all sing one part, that is the air; afterward, as they become more competent, they may try two parts, or three, or four. Meanwhile the four parts played in harmony make an excellent accompaniment to the singing, whether it is in one or more parts.

MAGAZINES FOR NOVEMBER.

THE HERALD OF HEALTH—CONTENTS:—General Articles: Common Mind Troubles. (6); A Talk about Kindergartens; Dangers in the Prime of Life. Our Dessert Table: A Song with a Moral; The Soul's Prophecy; In Sickness. Studies in Hygiene for Women: Prof. Newman on Cookery; A Nice Dish; Soda in Cooking; Heating Flour while Grinding; Corns; Esquimaux Wives; My Sick Boy; Oatmeal; Current Literature; Health Foods.

PRISON REFORM—There has been a feeble demand for prison reform from a few earnest and philanthropic people for many years, and through their efforts a good deal has been done to mitigate the severity of treatment criminals receive, and make it somewhat more rational—but it seems still as if there was much more to do in this direction, more perhaps than can be accomplished within a century. There ought to be a rational system of treating criminals, free from all cruelty on the one hand, or mawkish sentimentality on the other hand. One is as bad as the other. To treat an unfortunate being as a monster who has no rights any one is bound to respect, is itself a crime quite as great as anything the criminal has done. To incarcerate him in a dungeon away from light or air, or means of preserving his health, as is so common, is an insult to our better nature which ought not to be tolerated anywhere. To keep him on a meager and unnatural diet, and to deprive him of all opportunities except the very poorest for mental and moral improvement, is inconsistent with the enlightenment of the age in which we live. On the other hand sentimentality, pity, and coddling are not what is required in a true reform in the treatment of criminals. Sentimentality weakens whatever it touches—cruelty debases all that it acts upon. What is needed is something that will tone up and strengthen, rather than debase or weaken the character of the criminal. This can only be done by a system of education which shall be rational and adapted to his requirements. In our asylums for idiots we train these unfortunate creatures in a way to develop their weak intellects up to as high a standard as they are capable of rising. In the reform school for boys in Ohio a somewhat similar course is pursued, and it has worked so well that the boys rarely or never run away from the place, although the restrictions are so slight they could do so if they wished. These boys are not only taught every branch of agriculture, horticulture, and more or less of mechanic arts, but educated intellectually and morally. It is rational education, not punishment, that they receive. Health, intellect and moral nature are all braced up and strengthened. Even the hardest cases are generally made over into decent boys. This is reasonable and wise. The same course should be pursued with criminals. They should be educated, made over into decent men so far as possible, and their terms of imprisonment should be located in the country, and a large tract of land should be had, and this should be reclaimed and improved by prison labor, which need not compete with the labor of those outside, as now; but it should be made self-supporting. No speculators should control it. It might take years to perfect the plan, but it can be done, and some day will be done if humanity progresses as we hope and believe it will. Justice demands it. Criminals are too often so from an imperfect physical and mental organization and defective training, just as idiots are. They cannot compete with stronger men in the battle of life, and so take an easier way, as they erroneously think, to earn a living. Most of these can be reformed by a right course. It is our duty to do it.—M. L. Holbrook, M.D., in Herald of Health.

PHRENOLOGICAL JOURNAL.—CONTENTS: Five Great Men in Science; Notes on the Physiology and Pathology of the Brain; Studies in Comparative Phrenology: Sphenoidal Bone in the Carnivora, Rodent and Bird. Illustrated; Names and Places; Sandford R. Gifford, N. A. Portrait; The University of California; The Brantford Indians; Elphaz, the Pseudomaniac—The Phrenological Commentator. II.; How they Look in Outline; Keep a Journal; Confucius; Health in the Pulpit; Microscopic Analysis of Milk. Illustrated; Curing Disease by Fasting; The Bible for Health; Notes in Science and Agriculture; Editorial Items; Poetry; Answers to Correspondents; What They Say; Personals, Wisdom, Mirth, Library.

CELIA LAIGHTON was born in Portsmouth, N. H., June 29, 1835. When but four or five years old, her father, being disappointed in certain political expectations, purchased Hog Island (now Appledore) and made it his residence, declaring he would never return to the mainland. Here the girl lived for ten years, and during all that time rarely saw other men besides her father and brothers, yet her thoughtful, observant nature found much employment amid the rocks and shoals, and the vistas of the sea which surrounded her. These rougher phases of nature furnished material for many a tender verse which later on found its thousand readers in circles far away from the Isles of Shoals.

At length the lonely rocks became interesting to the outer world, as a seaside resort for Summer visitors, and among the first to go to Appledore was Mr. Thaxter, then a Portsmouth lawyer, who, being in delicate health, visited the island to recover his physical vigor, and built a little cottage. He saw the maiden of the Isle, was pleased with her appearance, and in process of time won her affections. Her father at first opposed a marriage, but at last reluctantly consented. Her first visit to the mainland was made on her wedding tour. Since then Mrs. Thaxter has passed her life sometimes on shore and sometimes at the Isles, where she has a modest and tasteful cottage in the vicinity of the well-known Appledore House, which is kept by her brothers. This cottage is reached by a well-worn path, often traversed by visitors to the island and guests of the hotel, nearly all of whom know the authoress by reputation, as the mixed crowds found at the popular water-resorts in the neighborhood of our large cities seldom make their appearance here, preferring to air their coarseness and lack of intelligence in some more congenial locality.

Mrs. Thaxter's poems and other writings bear so much upon the scenery and life of the Isles of Shoals, among which she has spent almost her whole mortal career, as far as it has extended, that she might well be named their poet and historiographer. Two volumes of hers published in Boston, are entitled "Poems," and "Among the Isles of Shoals" the latter being a collection of prose sketches. Of her poetry, perhaps "The Wreck of the Pocahontas," "Rock Weeds," "The Swallow," "Midsummer Midnight," would be among the favorite selections of those who are familiar with it.—Phrenological Journal for November.

ST. NICHOLAS.—CONTENTS.—Frontispiece, Once upon a Time; The Crew of the Captain's Gig: Golden-hair; a Russian Folk-story; Thirteen and Dolly, Verses; The Swiss Glaciers; A Nonsense Rhyme; The Magician's Daughter; Thistle-down, Poem; The Agassiz Association; The Outcast, Poem; Gleaning; Tom; Kitty's Shopping; Bugaboo Bill, the Giant, Verses; Mystery in a Mansion, chapters I and II; The Crow-child: Tinsel Without, but Metal Within, Verses; Fine, or Superfine; Some Curious Nests; Our Little Schoolgirl, Verses; The Great Secret; The Sad Story of the Chilly Family, Verses; Lacrosse; Sewing-machine Designs, six illustrations by H. W. Troy; Picture-jingle; For Very Little Folk; Jack-in-the-Pulpit; The Letter-Box; The Riddle-box, illustrated.

LACROSSE.—The Indian of North America is commonly supposed to be a grim and sober creature, who never laughs; a man who at all times conducts himself in a sedate and rather gloomy manner. He is very dignified, and never, never smiles. It is said that, when at home, he is always thinking of going on the war-path, or planning a grand and mighty hunt, or sitting by his wigwam thinking of nothing in particular, which is always a solemn proceeding in anybody.

Now, it is a curious fact that the Indian has been strangely misrepresented. It has been discovered that he really liked a little fun, and could enjoy a game as well as any one. The Chinese fly kites, and the wild Arabs of the Desert tell stories. It is thought the ancient Egyptians played jack-stones, and we may be sure the Japanese enjoy many games, as you may learn by looking at their picture-fans. All the civilized nations have games; the English like cricket, we have base-ball, and the people of Holland are supposed to have invented skates, for which they deserve the lasting gratitude of mankind. It is interesting to find that, after all, the Indians have been very badly treated by the historians, and that they, too, had an eye for fun, and even had a game of their own.

When the French first explored the great country to the north, along the St. Lawrence and the lakes, they found the Indians had a wild and exciting game that they played on the grassy intervals along the rivers, or on the ice in winter. Hundreds of Indians would sometimes play at a ball game, like that shown in the above picture. They used a ball of stuffed skin, and a curious bat, looking something like a "hockey," having a net of reindeer hide between the handle and the crook of the hockey. The French called the bat a *crosse*, and, naturally enough, the game was soon called "La Crosse." This is fortunate, for the Ojibways called it "Baggataway," and the Iroquois called it "Tekontshikwaheks," and there certainly would be little satisfaction in playing a game with either of these distressing names.—St. Nicholas for November.

DEMOREST'S MAGAZINE.—CONTENTS: Following out the Text; Oil picture from a painting by Mr. T. W. Wood; The Playmates. Steel Engraving; The Poetry of Autumn; The Flowers of the Field; Thanksgiving; Seed Time and Harvest; The Trumpet Major; Talks with Girls; Augusta Evans Wilson; A Wasted Harvest; Following Out the Text. House and Home—My Housekeeping Class; Fashionable Stationery; A Summer on the Rhine; Correspondents' Club, Young America's Corner—Where the Harebells and Violets Grow. Elizabeth Kirkwood, Concluded. What did he Make; Aspiration; Illustrated Rebus. Fancy Work. Editorium Fashions. Ladies Club.

This number of Demorest's presents many new styles, represented by cuts and written explanations, which as usual will serve to meet the demands of its patrons. Literary matter fills many of its pages.

DOMESTIC MAGAZINE.—Contents:—Fashions, Illustrated; The Undergoing; November Poem. Bertine; An Episode Mizpah (Poem) Selected; Treasure Trove; Art Paper; The Miracle of St. Agatha; The Relief Ship at Twilight (Poem); Fact, Rumor, and Comment; St. Martin's Summer (Poem); A London Letter; Household Department; New Books; Notes; Answers to Correspondents; Varieties; Publishers' Department.

THE reader of this number will find the customary matter of fashion, literature etc. The Household Department by Mrs. H. W. Beecher is interesting and calculated to confer a benefit upon hitherto careless housekeepers.

For Women.

CONDUCTED BY MISS RAY CLARK.

GRANDFATHER'S PET.

THIS is the room where she slept,
  Only a year ago,—
Quiet and carefully swept,
  Blinds and curtains like snow.
There, by the bed, in the dusky gloom,
  She would kneel with her tiny clasped hands and pray!
Here is the little white rose of a room,
  With the fragrance fled away.

Nelly, Grandfather's pet,
  With her wise little face,—
I seem to hear her yet
  Singing about the place;
But the clouds roll on and the streets are drear,
  And the world seems hard with a bitter doom,
And Nelly is singing elsewhere—and here
  Is the little white rose of a room.

Why, if she stood just there,
  As she used to do,
With her long, light yellow hair,
  And her eyes of blue,—
If she stood, I say, at the edge of the bed,
  And ran to my side with a living touch,
Though I know she is quiet, and buried, and dead
  I should not wonder much.

For she was so young, you know,—
  Only seven years old;
And her face was so wise and sweet to see,
  And it still looked living when she lay dead,
And she used to plead for mother and me,
  By the side of that very bed!

I wonder now, if she
  Knows I am standing here,
Feeling, wherever she be
  We hold the place so dear?
It cannot be that she sleeps too sound,
  Still in her little nightgown dress,
Not to hear my footsteps sound,
  In the room where she used to rest.

I have felt hard fortune's stings,
  And battled in doubt and strife
And never thought much of things
  Beyond this human life;
But I cannot think that my darling died
  Like great strong men, with their prayers untrue,—
Nay! rather she sits at God's own side
  And sings as she used to do.

MISS IRENE AGAIN.

Poor Miss Irene! What a flutter and a stir her letter has instituted?

It has been very amusing to read some of the replies to it. In the eager haste of some of the ladies to refuse to drag the married men over the coals, they have unconsciously given an occasional thwack that sent them right into the fire.

I am a married woman and I *know* that my better-half (?) is an exception that don't deserve to go over the coals, but at the same time I bear witness that Miss Irene was right in saying that *some* of them deserved to be dragged over the coals. I know, as all do, that there are exceptions, but sometimes I think they are largely in the minority.

Taken altogether, the majority of farmers' wives do have a hard life. It is churn and bake, wash, scrub and iron; make up beds, sweep and dust; sew, patch and darn, year in and year out. Her work is monstrous. It is she who must have the children, and she who must have the care of them, in addition to the other work. There is many a wife with a kind, affectionate husband, who is working herself into an early grave, because her husband is too blind to see that her burdens are too heavy, and she toils on, thinking it is her duty and never blaming him. *He* must have "help" to to do his work, and new machines also, while week after week she must "chug, chug, chug," with the old churn that makes her arms and shoulders ache.

If the baby is cross in the night it is mother whose rest must be broken, while father rests, because he "has the living to make." It makes no difference if she does have to wash or iron the next day.

I tell you, the majority of farmers' wives are a crying shame against their husbands. You will know them when you see them; pale, tired-looking women, dowdily dressed, and who look at you as you pass them in the street with a wistful, pleading look, that always reminds one of a deer at bay.

Now, I know exceptions, so don't all rise to quench my eloquence, as you did Miss Irene's. I know whereof I speak, for my mother was a farmer's wife and I too have "been around."

If somebody "dodges" at this, I'll know there is a guilty husband around.

I presume some of you have heard of the man who was struck in a crowd, but knew not who did it; seizing a stone he sprung upon a stump (it might have been a barrel, but it is proper to say "stump speech,") and said: "Somebody in this crowd struck me and I am going to hit him with this," at the same time aiming as though about to throw; every one but the man who had struck him stood still, while he quickly dodged and the first man threw away his stone and proceeded to thrash number two.

Speaking of "No. 2," Dr. A. E. S., is it not a little singular that she has lived to be nearly thirty years without ever having a chance to *help* make tomato cat-sup? (How absurd! a farmer *help* his wife make tomato cat-sup?) And you are *nearly* twenty-four, and are faithful and kind? Just wait until you and "No. 2," or her prototype are twain, and see how long you will be the latter. A man generally is that until he gets married, and then he pulls off his gloves and lets his wife see how brawny his hands are, and how hard he can hit with them.

For my part, I am strongly inclined to suspect "No. 2" of being a fraud—in other words, a married woman dodging for a guilty spouse.

Now, No. 2, if I'm wrong, I suppose you will "pitch into" me, and make it lively. They say old maids are generally pretty high-tempered, and the way you criticised Miss Irene, leads me to suspect you of being so.

An uncle of mine used to say that at twenty-five a woman was "simply an old maid," but at thirty she was a "*darned* old maid," and would explain to his reproving wife that by "darned" he meant "snarled," because, he would say, they were generally so "snarly at that age."

ALLINE RAY.

ECONOMY IN DRESSING.

FOR those who have money enough to buy dress material; take them to a fashionable modiste and there leave all care of them 'til they go for the finished garment, for these, articles are not written

I suppose, however, that that class comprises about one per cent. The remaining ninety-nine have to look more or less closely after the dressing of themselves or daughters; turning old dresses or renovating by adding to material, or renewing trimmings.

In the revolution that has taken place in dressing—gradually—during the last two years, home dressmaking has become a much easier matter than formerly. Twenty-two yards was a moderate dress pattern (I bought 27 yards of striped summer silk five years ago for a dress, and I have this last year, made *two* complete costumes of that dress). Dressmakers would make up the pattern for you at a cost of from $12 to $20, and declare they made very little at that, while they were assisted by a person not a born genius, serving an apprenticeship, to put on the elaborate trimming that made a dress a work of art.

There *are* such dresses now. We read of actresses who have costumes the trimming of which cost $15,000, but it is fast becoming bad taste to wear such dresses in private life.

Twelve yards of black satin, or seven yards of the plain satin, and five yards of brocaded satin, at a cost of $1.40 a yard, will make a lovely suit, rich, stylish, and at a cost of $18.50. Make the basque, round and finish to wear either over or under the skirt, make it plain and laced behind. The sleeves tight-fitting and trimmed to the elbow with three bands of brocaded silk, graduated, the highest band one-third the width of the one at the wrist, finished at the neck with a shirred ruffle of the brocade.

Make a short walking skirt of the plain satin trimmed with a flounce 12 inches in depth of the brocade cut bias and shirred—very scant, for it sets out too much if made full. The back of the skirt is two breadths of satin shirred at the top six inches in depth very closely. A wide belt lined with very stiff material, and two yards of the brocaded silk tacked to the dress as a sash and tied loosely, either on the left side or at the back finishes the dress. It can be worn without the sash.

The dress is lined throughout with fine, corset jean—without dressing or starch in it.

A plain skirt to look well, must set well, and for years I "labored" over skirts pulling back, so they would not "bulge" before, or "flop" behind, as a tantalized dressmaker said. I finally got a perfect fit and am happy.

Money cannot buy that pattern: if I had to do without it, I would feel much inconvenience. In my next article I will describe a made over ladies cloth polonaise.

O. W. D.

Mich.

HINTS.

INK ON CARPETS.—Take up as much of the freshly-spilt ink as possible with a sponge, then wet with water and soak with a sponge repeatedly; finally, rub the spot with a little wet oxalic acid, or salt of sorrel, wash off with cold water and rub with aqua ammonia.

TO CLEAN LOOKING-GLASSES.—Keep for this purpose a piece of sponge, a cloth, and a silk handkerchief, all entirely free from dirt, as the least grit will scratch the fine surface of the glass. First sponge it with a little spirits of wine, or gin-and-water; so as to clean off all spots; then dust over it powder-blue, tied in muslin, rub it lightly and quickly off with the cloth, and finish by rubbing it with the silk handkerchief. Be careful not to rub the edges of the frame.

HOW TO CLEAN HAIR BRUSHES.—It is best to clean two at a time, in this way: First comb them well, to remove the loose hair or dust, then dip the bristles only in very warm water, sprinkle each brush with plenty of powdered borax, and rub the two together; after they are cleansed thoroughly, have a pitcher of hot water, and pour it over the bristles; keep the back of the brush as dry as possible. Shake the water well out, and dry quickly in the sun. Brushes washed in this way will retain their stiffness.

BLEACHING FLANNEL.—Flannel which has become yellow with use may be bleached by putting it for some days in a solution of hard soap to which strong ammonia has been added. The best proportions are one pound and a half of hard curd soap, fifty pounds of soft water, and two-thirds of a pound of strong ammonia solution. The same object may be attained in a shorter time by placing the flannel for a quarter of an hour in a weak solution of bisulphate of sodium, to which a little hydrochloric acid has been added.

ABOUT WOMEN.

MISS KELLOGG has been very successful in opera at Vienna. She is the only cantatrice who, during the past few years, has been allowed to sing in Italian in the Imperial Opera House, all others singing in German.

MISS FANNY DAVENPORT has everything about her new play ("The American Girl," written by Amadecheron) American; and her dresses are not only made in America, but she publishes the fact.

MRS. LYDIA MARIA CHILD, the well-known authoress, who died recently, was born in Midford, Mass., February 11, 1802. Her ancestor, Richard Francis was born in Cambridge, Mass., in 1636. She was educated at the public schools and spent one year in a seminary at Midford. From 1825 to 1828 she kept a private school in Watertown. In 1828 she was married to David Lee Child a lawyer of Boston.

MISS KATE FIELD has been successful in arranging with Mr. Anthony Pulbrook, the founder of the London Ladies' Dress Association, to visit New York and start the association in this city in connection with the parent establishment, but each as a separate undertaking. Mr. Pulbrook expects to leave England early in November, and on his arrival the public will be informed of the manner in which the association will be conducted.

SHE was only a factory girl, but she had a lead pencil, and she had faith. She earned her living in the thread-room, and one morning wrote on a clean, white spool her name and the words, "Wanted a husband." When it had been wound with thread it was sent to a South Norwalk shoe factory, where it fell into a man's hand. He opened a correspondence, the girl replied that she was engaged, but would find him another as good as she, and a marriage has taken place as the result of the spool's message. Who says that the age of romance has gone by?

MISS EMILY A. SMITH, Assistant State Entomologist of Illinois, has been elected a member of the Entomological Society of London.

MISS CLARA LOUISE KELLOGG has brought away from Vienna a souvenir of the pleasant impression she made upon the audiences of the Grand Opera. An unknown admirer sent to her hotel, anonymously, a bird of beautiful plumage in a cage of gold.

MISS EMMA C. THURSBY has been spending the greater part of the Summer in Germany, where she has been staying for the benefit of her health, studying at the same time, so that her singing shows remarkable improvement.

A CRITICISM.

I DON'T like the advice given in the RURAL for girls to *stick* their hair with gum-arabic to keep it in curl. It is a wrong to the pretty, soft, shining locks that young girls ought to have, and if it will not curl without gum-arabic, why, let it go straight.

A. L. J.

[The hint to which the above writer refers appeared in issue of October 23d, and was applied to crimping, not curling, the hair.—R. C.]

Don't physic, for it weakens and destroys, but use Hop Bitters, that builds up, up!

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

"ANOTHER cookery book!" It was the family cynic who said it when, on the occasion of a birthday, I gave one of our amateur cooks Mrs. Henderson's "Practical Cooking and Dinner-giving." It has been proved to me by experience that there is no book little girls like better; for I am certain no gift of mine has given more pleasure or been of more use, than Marion Harland's "Common Sense in the Household," given to one of my girls nine years old, some years ago. And we had wanted Mrs. Henderson's book a long time and were not disappointed. It was so different from the rest of our cook books; so charming in its pictures of the breakfast and dinner and tea tables, for which it catered, that we could not help feeling a sort of fascination in its contents. It does not make one feel so economical as do the thin pages of Juliet Corson's little book, but seems to have struck a happy medium that is always needed in cooking to make us feel at home with the writer and with one's own provision of ingredients.

One chapter on "Cooking as an Accomplishment," is especially entertaining and I will quote a few lines. "A young lady can scarcely have too many accomplishments, for they serve to adorn her home and are attractive and charming generally. But of them all—painting, music, fancy-work or foreign languages—is there one more fascinating and useful, or one which argues more intelligence in its acquisition than the accomplishment of cooking?"

There is to be established this Winter in the city of Montreal a cooking school by a lady from the South Kensington School, London, England. It deserves to succeed, but I doubt if it will for different reasons. One is, the contempt with which young girls look upon this work, inculcated by precept and example, and another, that no *class* could be found in this most conservative of cities, every clique in it deeming itself exclusive. And in this case, as in all country homes also where young girls must practice at home the domestic arts, I advise mothers to give them some one or two of the best works on the subject—even though a family cynic should exclaim, "What! another cookery book."

Ointment for Chapped Hands.

Melt one ounce of spermaceti and one-half drachm of white wax in one ounce of oil of sweet almonds, then add one-half ounce of pure glycerine and stir until cold. Scent if you please with whatever perfume liked. This is excellent for chapped hands or lips. For the hands apply at night and draw on a pair of old kids to prevent soiling bed-clothing.

MARY B.

Puff Puddings.

Four eggs, yelks and whites beaten separately. To the yelks add three cups of sweet milk, a tablespoonful of melted butter and three cups of sifted flour. Stir in the whites the last thing. Bake in buttered cups—I use 10 teacups. Eat hot with sauce.

E. L.

Beef Tea.

Mr. Wilkinson of St. Mary's Hospital, London, advises the following improved method of preparing beef tea:

The meat is cut into small pieces and placed, in the evening, in an earthenware vessel, with sufficient cold water to cover the meat; in this it is allowed to remain all night. In the morning the meat is taken out, placed in other water, and boiled for several hours. The meat of the previous day is then passed through a mincing machine, and put into the cold liquor in which the meat was steeped the previous night, and upon this the boiling liquor from the day's beef tea is poured, and the whole well stirred, and it then forms the complete beef tea. The characteristics of good beef tea are that all the nutritious elements of the beef should be made available; and by the process carried out as above this is effectually done, the albumen, fibrine, and gelatine being all retained and taken by the patient. Moreover, by the above method a much smaller quantity of meat is required than under the ordinary mode, and it would, consequently, not become a jelly if allowed to stand; but by adding a larger quantity of beef this result could of course be obtained. (This forms with us what is called beef jelly.) It should, however, be remarked that in very hot weather the beef tea cannot be made in this manner, as it would become sour from the length of time required for its preparation.

QUESTIONS ANSWERED.

Cafe-au-lait.

Please tell me how much coffee I must use in making the celebrated *cafe-au-lait*.

MRS. A. B. J.

ANS.—One pound of coffee to a quart of water. A tablespoonful of this "black coffee" is added to a cup of boiled milk. The milk should be new, and slowly simmered to a creamy richness before using.

Autumn Leaves; Coloring Grass; Keeping Grapes.

1. Will you please tell me how to press Autumn leaves so they will keep their color; 2, also how to color grasses red, blue, purple and yellow? 3. Can grapes be preserved on their stems until Christmas, and if so, how?

D. THURSTON.

ANS.—1. Immediately after gathering, rub each leaf with a moderately *warm* iron, which has been first rubbed with white wax. Pass the waxed iron but once over each leaf, waxing it afresh each time. 2 Use Leamon's aniline dyes. The different colors come in small packages and can be procured of almost any druggist. 3. Yes. Pack in perfectly dry, old sawdust or cork chips. Keep in a cool, dry atmosphere, little above freezing.

Superfluous Hair, etc.

Can you give us a recipe that will permanently remove superfluous hair; also, what will make the hair soft and pliant? These recipes are required by certain lady friends, and if you know of anything that will serve their purpose it will oblige them very much. Have tried some of the superfluous-hair-removing powders, sold at $1 a small bottle, and found them to be complete frauds.

J. F.

ANS.—We know of nothing, neither do we believe there is anything that will remove superfluous hair without injuring the skin. In books on hints and of recipes for the toilet there are scores of recipes for removing hair, all of which in our estimation are harmful, and we advise our friends to let them alone. As to making naturally harsh hair soft and pliant, one might as well set to work to try and change his complexion. All fluids, pomades or oils tend, by evaporation, to carry off the natural moisture of the hair, and the more volatile the substance used, the more effectually the vitality of the hair is impaired. Alcohol, therefore, so much used in preparations for the hair, changes its natural color and renders it brittle. One of the most harmless preparations we know of is a mixture of one part glycerine to three of rose-water. This, while it does not produce any permanent change in the texture of the hair, makes it for the time being soft and pliant.

Physicians of all Schools use and recommend Hop Bitters; take their advice.

News of the Week.

HOME NEWS.

MONDAY, NOV. 15, 1880.

The Stewart block at Middlebury, Vt., was burned on the 10th. The following are the losses and insurances: Hon. John W. Stewart, on building, $10,000; insurance, $6,000. T. M. Chapman & Co., dry goods, groceries and provisions, on stock, which was partially saved, $4,000; insurance, $2,000. Masonic Lodge, $2,000; insurance, $1,000. L. D. Eldredge and C. M. Willis, attorneys, books and papers, amount unknown. The offices of the secretary of the Vermont Merino Sheep Breeders' Association and Town Collector M. C. Monroe, were in the building.....Montana has fourteen newspapers, and they are classed as being Democratic, three; Republicans, three; Independent, seven; Grange, one.....There are seventeen lepers at the Small-pox Hospital in San Francisco—sixteen Chinese and one white man. It is not long since Chinatown was overhauled, when a large number of these persons were discovered. They were put upon the steamer and sent back to China..... .At Millett's ranche, in Seymour County, Kansas, a man named Hankinson and a Mexican were engaged in roping a large bull. They had thrown two ropes on the animal, the Mexican having hold of one while the other man had tied his rope to some stationary object and was trying to throw the animal by making him lunge forward. Upon making the lunge the stationary rope broke and the pull made by the Mexican caused the bull to turn suddenly and dart in an opposite direction, and as he went he caught his pursuer on his horns and tossed him aside. Upon examination the gored man was found to have received a rupture several inches in length in his abdomen and the larger intestine was torn in two places. The man lived a day or two and died.....Charles Reed, station agent at Tenino, W. T., has a railroad velocipede, and recently fixed it with a short arm so it would run on the narrow-guage, it having been built for the wide track. He can run into Olympia in an hour.

The Supreme Court of Illinois has made public a decision, which is regarded as a virtual triumph of the Western Indiana Railroad over the Lake Shore and Michigan Southern, regarding entrance into Chicago for the Western Indiana road..... On the 7th John Berkley, colored, while returning from church with two other colored young men, three miles from Bloomfield, Ky., was fired on by some one concealed in the weeds in a fence corner and his heart literally torn out. His companions fled without discovering the criminal. When his body was found it had been robbed.....The five-year-old son of John Glass, of Williamsport, Pa., was caught in a swinging bridge at that place on the 10th and killed .....Ellen Skeets, a colored woman, was burned to death by the explosion of a coal-oil lamp at Coleville, McKean county, Pa., on the 9th.....William McGregor and wife lodged in the Allegheny, Pa., lockup on the 9th. They represented themselves to be the parties who were arrested on suspicion of being members of the Bender family.....A fire at Petrolia, Butler county, Pa., on the 10th, destroyed the Bly-Miller Hotel, Orrwig's paint store, Backus's hardware store, the offices of the United Pipe Line, Western Union Telegraph, the bank, and Harley's purchasing office. Loss, $15,000.

The question involved in the case of the New York Elevated Railroad Company vs. Commissioners of Taxes, decided in the Court of Appeals, was that the city had the right to assess as real estate the structure of the Elevated Railroad Company and impose a tax upon it. The railroad claims it owns no real estate unless the foundations or posts are such. The Court below held that the foundations and superstructure were properly taxable as real estate, and the Court of Appeals sustains that view.....Moses Grinnell, 70 years old, shot and killed Charles Thomas, unmarried, on the 10th, at Tiverton, Four Corners, R. I., in a dispute about a trifling affair. The murderer is in custody..... Leonard Heffner's restaurant in Ellenborough, Wis., was burned on the 6th, and two of Heffner's children—aged three and five years—perished in the flames. The mother was severely but not fatally burned.....The Smithsonian Institution has been informed by Professor Swift, of Rochester, that the comet announced as discovered by Lohse is that discovered by himself on the 10th of October, 1880, and is identical with the third of 1869.....In the Union County Circuit Court of Arkansas, on the 8th, Bennett, who assassinated A. C. Jamieson in March, 1879, by shooting him from an ambush, was convicted of murder in the first degree, and will probably be hanged..... During a bar-room fight at Memphis, Tenn., Mat. Reeves, a steamboat mate, was stabbed eight times by Monroe Clink, a night watchman. Reeves died from the effects of his injuries, and Clink has been arrested.

Mrs. Reed, of Spearfish, Dakota, was before a Deadwood Justice of the Peace the other day upon a charge of burglary. She became involved in a dispute with a neighbor, Charles O. Bates, over the ownership of the house he was living in, and during his absence hitched a bull team to the building and dragged it away. She was acquitted. .....A pig won on an election bet at South Bend, Ind., was, as the proceeds of all bets should be, turned over to the central committee, and on Friday was sold at auction for the benefit of the poor, realizing $216.....Social circles at Gardiner, N. Y., are greatly excited at present over the elopement and marriage of Miss Carrie M. Plant, a young white woman, with James W. Sampson, a mulatto. Miss Plant is a niece of Mr. John H. Deyo, a well-to-do farmer, residing in the town of Gardiner, who, during the war, was extensively engaged in trading along the Mississippi, and was estimated to be worth $150,000. He was well known at New Orleans and thereabouts. After the war Mr. Deyo settled down on his farm in that town, and as he was childless his niece Carrie Plant, was adopted into the family. During the past Summer Mr. Deyo being sick and unable to assist in the working of his farm, hired James Wesley Sampson, a young colored man about 21 years of age. He was a good worker, polite and pleasant about the farm, and soon won the good-will of those about him. After a time it was noticed that Wesley was paying Miss Plant too much attention, and her uncle two weeks ago concluded that it would be advisable to send his niece off on a visit for a month or so. But before he could make his intentions known both Wesley and his niece were missing. Search was at once instituted, but without avail. The climax was reached on Saturday last, when it was discovered that, after encountering many difficulties, the runaway couple had been made man and wife....

An old and bitter feud in Gallia County, Ohio, ended in murder on Saturday the 10th. The scene was at the little village of Bladensburg, 12 miles below Gallipolis, on the Ohio River. John J. Jeffers was quietly riding along the road when he met his bitter enemy, Col. James H. Montgomery. When within a few paces of each other, Montgomery squatted, and, cocking a carbine, shot Jeffers through the body. The man lived only two hours. In his ante-mortem statement he said that previous to the fatal shot he exclaimed, "Look out." This is not denied by the murderer. No weapon was found on the deceased. After the shooting Jeffers remained quiet for fear that his enemy would finish the job with another bullet. Montgomery surrendered. Two years ago Jeffers opened fire on Montgomery from behind a straw stack, emptying five cartridges from his revolver. He claimed that Montgomery was intimate with his wife. This the wife denied, and other facts confirming her story, a defense of insanity was set up by Jeffers' attorneys at the trial which followed the former shooting. On the third trial Jeffers was sent to the Ohio Penitentiary, and had been home two months when he met his death. Two weeks ago, Jeffers had Montgomery arrested for perjury in the above case. He was acquitted, and was on his way to swear out a peace warrant against Jeffers when he bagged his game. The murderer has been the scourge of that most villainous section of the country for years. Two men have been sent to their long home by his ready weapon. He served a term in the Ohio Legislature, and was the Democratic candidate for Senator from this district last Fall. He is prominent in local politics and is a noted bully, and very quarrelsome. He served with distinction in the late war.

A lad in Elmira, N. Y., has lost an eye from epizootic poisoning. His other eye is endangered. The lad wiped his face with a handkerchief he had used to remove some mucus that his horse had coughed on his coat sleeve.

FOREIGN.

THE IRISH DISTURBANCES.

Dispatches from London say that there is reason to believe that the Ministry do not contemplate any immediate exceptional measures for the preservation of peace in Ireland, but intend to defer action until the meeting of Parliament, which may be expected early in January. The St. James Gazette, in its leading editorial expresses fear that the Ministry are driving, or being driven, toward legislation creating a peasant proprietary throughout Ireland, probably with a view to extending the operation to the rest of the United Kingdom later on. The ultimate means will probably be the purchase of the land by the State and its distribution to the peasantry, to be paid for in a certain term of years. Nothing short of this will be accepted by the Irish agitators. The Radical members of the Government and their support will consent to coercion. The Ministry will yield to the Radicals rather than suffer the Cabinet to break up. An attempt may be made to clothe the plan in some disguise, but substantially, and in its full effect, this is what the extreme men in the Cabinet are hoping and striving for. Should the measure fail to pass the House of Commons, or having passed the Commons, be rejected by the House of Lords, as it almost certainly would be, the demagogues would go to the constituencies with a good cry, for the imagination of the masses is readily kindled by schemes for transferring property from rich to poor men, and they know that they would never be taxed for carrying out such a scheme. It would be the affair of the income-tax payer.

BURIED IN A COAL MINE.

Early on the morning of Nov. 12th, an explosion of gas occurred on the south side of Foord Pit, at the Albion Mines, Stellarton, Nova Scotia. All the miners were at work in different bands. The explosion was so terrible as to sweep quite across the pit, killing men and horses within reach. Almost all the men on the north side will be saved, while all at work on the south side have been lost. At least sixty are said to be missing. Five men have been brought up and are likely to recover. Probably forty are shut up with the fallen coal on the south side. The accident, it is presumed, was caused by some miner firing a shot in the forbidden part of the workings. The number still in the pit is said to be 44. It is feared another explosion will occur when the pit gathers gas again. Work is totally suspended at all the collieries in the county and miners have come to the scene of the accident in great numbers, but altogether powerless to render any assistance on account of the precarious condition of the pit. At ten o'clock on the 13th another very heavy explosion occurred, blowing the roof and gear of the fan shaft, timber, bricks, etc. high into the air. It is fully expected that the fire, which must now be immense in the mine will soon show itself from the mouth of the shaft, when all the buildings in the vicinity will be in the greatest danger. Very great fears are entertained that the whole workings of Foord Pit will be destroyed, though efforts are now being made by a large gang of men who are at work digging a trench to let into the mine water from the river close by. This is a last resort, and it will take a good while to get sufficient water in to drown the fire. It is hoped that the fire may be confined to Foord Pit and prevented from extending to the workings of Cage Pit, situated half a mile west of Foord Pit. These pits are connected by a tunnel. Should these works be destroyed the consequence to the working classes connected with the mine will be terrible. Untold misery must be the result. The employes of the company number over 500. Other and more terrible explosions may occur at any time. The greatest excitement prevails.

[Manchester, (Mich.) Enterprise.]

Messrs. Haeusler & Kingsley, Druggists, Manchester, say: We handle St. Jacobs Oil with abundant success, and it has given excellent satisfaction to our customers.

AGRICULTURAL NEWS.

The weather in the Northwestern States during the past week was fine, with colder though seasonable temperature. The field work has been further advanced than usual, and a large area of Winter Wheat has been sown in the Spring Wheat producing States. The Winter Wheat has a fine appearance, showing an even luxuriant growth.... There has been an increase in the visible supply of Wheat of 2,632,464 bushels, and a decrease in the visible supply of Maize of 2,041,584 bushels, as compared with the statement of the previous week. The stock of Wheat at the Atlantic ports at the close of navigation will be much less than last year. The visible supply of Wheat Nov. 6, 1880, was 8,674,127 bushels less than on Nov. 8, 1879, and of Corn 5,874,170 bushels more this year than last at the corresponding dates.....The exports of Wheat and Flour from North American Atlantic and Pacific ports from July 1, to November 8, 1880, have been equal to 87,562,000 bushels against 94,363,000 bushels for the corresponding period in 1879.....An early close of canal navigation is expected; probably by the 28th instant. Lake navigation will be practically closed on the 28th of November, as insurance policies on hulls of vessels usually expire at that date, and special rates, usually very high, prevail after that date Shipments via the St. Lawrence for Europe will probably terminate for the season by the 25th of November. Shipments of Grain from Buffalo by canal will be limited after the close of this week. The stock of Wheat on the canal November 6, was about 2,240,000 bushels, and of Maize 909,000 bushels; and on the lakes—Wheat, 1,862,000 bushels and of Maize 3,140,000 bushels.....The estimate of the Agricultural Department or the Wheat crop of the United States in 1880 will be published on Monday, this afternoon, and will be about 30 million bushels more than the crop of 1879. The increase is mostly in the Pacific States.....The Agricultural Department's estimate of the California and Oregon Wheat crop of 1879 was 3,011,800 acres area, and 43,188,800 bushels yield. The outcome of the crop of these States in 1879 was about 10,000,000 bushels less than the Department's estimate. The exports from these States was 23½ million bushels, and seed and food about nine million bushels, making the outcome 32½ million bushels instead of 43,188,800 bushels.....The estimate of the crop of the Spring Wheat States in 1879 was also too large. There is now a generally prevailing opinion among commercial men engaged in the Wheat trade that the crop of 1880 is no larger than that of 1879, and the opinion of a very considerable number is that it is less than the crop of 1879.

News from Sydney dated September 3, states that cattle were dying in the Armidale district of New South Wales from want of grass, and lambing prospects were gloomy on account of the long-continued drought.....In Queensland, at the same date, no rain had fallen..... ...In South Australia, by September 11, there had been abundant rains, which had extended to the northern parts of the colony where they were greatly needed..... In Victoria mild Spring-like weather had prevailed, although from a number of the cereal-growing districts inland frequent complaints of want of sufficient moisture were being received. Pastoral prospects in the colony were generally reported as good ..... .In Western Australia, according to news of September 4, sheep depasturing in the neighborhood of Port Darwin were doing exceedingly well. Feed abundant and the natives friendly and tractable. The export of wool from Port Wallcott this shearing, will probably reach 2,000 bales.....

In France the Minister of Agriculture has issued a notification to the prefects, rendering the disinfection of railway trucks in which live-stock have traveled compulsory, and requiring, further, the cleansing of the pens and parts of depots passed through by them. The Hungarian Minister of Agriculture has devoted 30,000 florins to institute means for the prevention of the phylloxera. It is proposed to employ the sum in the following manner:—First of all a center will be formed where all questions, relating to this disease, will be discussed and, if possible, many of the present confusing ones will be answered; the various means of stopping and curing the phylloxera will be tried, and the powers of resistance contained in the native varieties of the vine to its ravages, well tested. The means used in France will be generally used in this center also, as they have up to the present, been followed by the greatest success. The use of sulphur, submersion, and the cultivation of the American vine will be tried. A large quantitity of these vines are to be procured from America, in order to have them at hand for the supply of vinegrowers in Hungary.....A Beet Sugar Company commenced operations at Farnham, Ont., Oct. 12; a large number of men are being employed, and buildings 300ft. in length are in course of erection.. ....The raising of Angora goats in Western Texas is increasing, and it is alleged to be a profitable business.....The North American Bee-Keepers' meeting, at Cincinnati, was attended by one hundred and fifty delegates from different States.....It has been estimated that the yield of the Cuban sugar crop this year is about 545,400 tons, against 680,000 last year, a decrease of about 20 per cent.

Minnesota is grinding her immense crop of Spring wheat—40,000,000 bushels—into flour, and shipping it to New York and Europe, on direct orders. The crop of that State has thus ceased to be a factor in the speculative wheat trade of the West.....The prospects for the Egyptian cotton crop continues excellent.....Spain, with only 17,000,000 inhabitants, turns out yearly twice as much wheat as does Italy with 28,000,000 of inhabitants... ....From one-acre of ground in North Denver, 1,843 watermelons have been produced and sold this year for 30 cents each—a total of $552.90.....The Houston Post estimates the cotton crop of Texas for this year at 1,250,000 bales, or one-fourth of the entire crop of the United States.

The Proof of the Pudding is in the Eating.

Grocerymen and storekeepers pay 3 to 5 cents a pound extra for butter made with Gilt-Edge Butter Maker. It increases production 6 to 10 per cent.; reduces labor of churning one-half; gives a rich golden color the year round. Sold by druggists, grocers and general storekeepers. Send stamp for Hints to Butter-Makers." Address, Butter Improvement Co., Buffalo, N. Y.

LYDIA E. PINKHAM'S VEGETABLE COMPOUND will at all times, and under all circumstances, act in harmony with the laws that govern the female system. Address Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass, for circulars. Sold by druggists.

There are more cures made with Hop Bitters than all other medicines.

[Daily Fort Wayne Sentinel.]

Mr. S. H. Joseph, Agent of Emerson's Minstrels, remarks: I can with truth speak from experience; and in saying St. Jacobs Oil acts in a marvelous manner I but partly express my good opinion of it.

Big Giant Still Ahead.—At a trial of Corn and Cob Mills, held at St. Louis, October 27, 1880, the Big Giant, made by J. A. Field & Co., came off victorious, leading its rivals by a large majority. Their No. 1 Mill was the one used; it ground one bushel of ear corn in 3⅗ minutes, while the best time shown by its competitors was 5 minutes, using only one horse, its draft was 110 pounds. Its competitors used two horses, and their lightest draft was 225 pounds. The Big Giant showed superiority in every point—draft, time, work and price, and also showed *that they do use* a cast cast-steel grinder. All this was done with their smallest-size mill.

Tropic Fruit Laxative, an agreeable substitute for pills and nauseous purgatives. One lozenge is the dose. Physicians prescribe it. Sold by all druggists.

The Markets.

SPECIALS FROM THE CHIEF CENTERS

Until Saturday, Nov. 13.

Chicago.—WHEAT active; No. 2 Red Winter, $1.04½@$1.04½; No. 2 Chicago Spring, $1.04½@$1.05, cash; $1.05, November; $1.05⅝, December; $1.06½@$1.07, January; No. 3 do. 92c@94½c. CORN fairly active at 42c. cash; 42½@42⅝c, December; 42⅝c@42¾c, January; 47c asked, May. OATS easier, at 30½c, cash; 31c bid, December; 31 3-8c @31½c, January; 35½c bid, May. RYE firm at 84c. BARLEY firmer at 89c. PORK easier at $13.50 @$14.25, cash; $12 15 bid, November; $12.20 bid, December; $13.55@$13 57½, January. LARD easy at $8.05@$8.07½, cash; $8.02½, December; $8.07½ @$8.10, January. Bulk-meats easier; Shoulders, $4.60; Short Rib, $7.10; Short Clear, $7.20.

Cincinnati.—WHEAT easy; No. 2 Amber, $1.07; No. 2 Red Winter, $1.08. CORN scarce and firm; No. 2 Mixed, 47c; new car, 42c. OATS quiet, but firm; No. 2 Mixed, 33c. RYE dull and nominal; No. 2 at 92c. BARLEY in good demand: No. 2 Fall, 92½c@95c. PORK quiet at $13.50. Lard in good demand at $8.10@$8.12½c. Bulk-meats steady; Shoulders, 4½c; Clear Rib, 7½c. Bacon quiet, but steady; Shoulders, 5½c; Clear Rib, 8 1-8c; Clear Sides, 8¼c.

St. Louis.—WHEAT—No. 2 red Fall, $1.03⅛ @1.05⅝, cash; $1.03⅞ bid November; $1.05¼ @1.05⅝, December; $1.07⅛@1.08, January; $1.10⅝ @1.10⅞, February. CORN dull and nominal, cash; futures better at 42½c. bid cash; 42½@42⅝c., November; 41¾@41½c., December; 41¼c., January, 42c., February; 45½c., May. OATS dull at 31@31½c. cash; 31c. bid November; 31½c., December. RYE steady at 86c. BARLEY steady and unchanged. PORK dull at $14. Lard quiet at $8. Bulkmeats steady and unchanged. Bacon lower; shoulders, $5.50; clear rib, $8.20; clear sides, $8.40.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 13, 1880.

BEANS AND PEAS.—The market for beans is fairly steady, prime new receiving most attention. Fancy beans are scarce at this moment, but the supply will arrive in time. Green peas firm for perfect Wisconsin; Eastern in bags quoted at 10c. under bbl. Southern S. E. peas quiet.

Marrow beans, new, $1.75; old, $1.62½@1.65; medium, new, $1.50@1.55; other, $1.40@1.45; pea, new, $1.55@1.75; white kidney, new, $1.70@1.80; red do., choice, $1.75; fair to good, $1.45@1.50; black, or turtle soup, $1.55 @1.60; green peas, $1.90@1.95; So. S. E. peas, $1.80@1.85.

BEESWAX.—Has a moderate inquiry and small. Sales at 28@27 for Western and Southern.

BUTTER.—Supplies are not being released in large volume, and holders of high-grade stock, creamery or half-tubs manage to dictate recent prices, That is about all they venture, for, when they mention anything above annexed rates, there is a risk of the buyer turning to some of the small well-made lines incident to Fall receipts, and which may be obtained at best entire dairy prices. For any valuable export purpose the market is over the heads of foreign shippers. Of course, there are many common and Summer lines of State and considerable old Western which could be dealt in, but quotations for them are too near what were paid early for a nicer style of goods. Locally there has been some revival at full dairy sales, but the standard looked for had to have Delaware or best Chenango merit. Some dealers have been holding creamery in view of reduced make. Better deliveries of Western are expected. Local trade is quite evenly divided, as prices for the grades of State that compete with Western are very close to each other.

Creamery, finest, 32@32½c.; good to prime, 30@31c.;

fair to good, 27@30c.; poor to fair, 24@27c.; sweet cream, 25@26c.; State entire dairies, choice, 26c.; good to prime, 24@25c.; fair to good, 23@24c.; firkins, 21@26c.; State pails and half tubs, fine fresh, 23@29c.; good to prime, 26@27c.; fair to good, 24@26c.; poor, 20@23c.; Welsh tubs, fall prime, 27@28c.; good to prime, 23@25c.; fair to good, 21@22c.; Western imitation creamery, 20@26c.; dairy, fresh, 23@24c.; good to prime, 20@22c.; fair to good, 18@20c.; factory, June, 17@19c.; do, current make, 19@21c.; other, 16@19c.; poor, 14@15c.; a few rolls, 26@28c.

Receipts for the week, 31,225 pkgs. Exports for the week, 4,800 pkgs.

CHEESE.—The feeling this week has been a trifle stronger on choice brands, and at the close these reach 13¼. Ordinary lots of fancy run at 13 for September made, and 12¾ for the October. The market closes in good shape with moderate accumulations only. Quotations are for

State factory, fancy, at 13@13¼c.; do. good and prime, 12¼@12¾c.; do. fair to good, at 11@12c.; do. b'f skimmed, 8½@10c.; Wisconsin factory, fine, 12¾@12¾c.; do. good to prime, 12@12¼c.; do. fair to good, 10¾@12c.; Ohio factory, fine, 12¼@12¾c.; do. good to prime, 11¾@12c.; do. flat, fair to good, 10@11¾c.; do, poor to fair, 7@10c.

Receipts for week, 44,922 boxes.

Exports for the week, 24,900 boxes.

Steam to Liverpool, 35@45s.

COTTON.—There has been little life to the market this week, with prices unsettled. Latest prices are for

November at 10.80c.; December at 10.74@10.75c.; Jan. at 10.84@10.85c.; February at 10.95@10.97c.; March at 11.10c.; April at 11.23@11.25c.; May at 11.35@11.37c.; June at 11.47@11.49c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Good ordinary	7¾	Low middling	9¾
Strict good ordinary	8¾	Middling	10¼

Receipts for week, 49,567 bales. Exports do., 18,531 bales.

DRIED FRUITS.—The most prominent item to note this week is in extensive purchases of low grade apples, which have exceeded 200,000 bs. on wants of the French markets; the prices have been from 3½@3¾; evaporated apples are in moderate demand only, and as they are plenty prices are easy. Peaches move out well in small lots. Small fruits are firm.

Evaporated apples are quoted at 7¼@8c. for better qualities; sliced apples at 5@6¼c. for good to choice North Carolina 3¾@4¼c. for Va. apples, 4¼@4c. for Tenn. do; 4¾@5¼c. for State do; 3½@5c. for western Ohio and Mich. Peaches at 27@30c. for evaporated peeled; 14¾@14¾c. for unpeeled do.; N. C. peeled at 18@20¾c.; for the better qualities, and 12@16c. for fair to good lots of peeled peaches; unpeeled peaches at 6½@7¾c. for halves and 6¾@7c. for quarters. Plums at 13¾@14¾c. Blackberries at 7½@8c. Cherries at 18c. Raspberries at 24¾@25c. Whortleberries at 12c

Receipts for week, all kinds, 2,375 pkgs.

Exports for week, 4,328 bbls. of dried apples.

EGGS.—Receipts for the week, 11,379 bbls.; do last week 8,332 do. Supplies are large, but as before, mainly composed of limed. All fresh lots are selling readily. A few Southern come forward and bring prices quite up to best Western. The small size of Southern checks their sale. Limed more for common use.

Near points 29@30c.; State and Pa. 26@27c; Western fresh, 25½@26c.; seconds, 23@24c.; Canadian, 24½@25c; limed State 18@18½c.; do. Western 17@18c.

FLOUR.—Prices have been generally strong on a good demand for all grades, the shippers buying freely.

Latest prices are: $3.65@4.35 for very inferior to fancy superfine State and Western; $4.65@4.90 for poor to choice extra State and Western, odd lots and lines; $4.90@5.00 for choice to fancy do.; inferior to good white wheat, trade and family extras, $5.10@6.00; good to choice do. at $6.00@6.50; (very fancy do. up to $6.85@7. an extreme;) red and amber winter wheat inferior to choice trade and family, at $5.00@6.35; round hoop Ohio, $4.90; and trade and family brands of do. at $5.45@6.35 (the latter for strictly fancy; St. Louis at $5.10@6.00 for inferior to good extra; $6.00@6.50 for good to choice (and $6.50@7.00 for choice to very fancy brands); Minnesota clear, inferior to fancy at $4.80@6.50; Minnesota "straight," poor to fancy, at $5.90@7.25, and patent inferior to fancy at $5.90@8.50; unsound stock at from $2.90@5.50; city mill extra at $5.20@6.15 for ordinary to very choice for the West Indies; do. for England, $4.60@4.90 for poor to choice spring wheat, and $5.10@5.85 for winter wheat product; do. trade and family extras, $5.90@7.00; do. for South America, $6.00@6.35, the latter for very choice; No. 2 at $3.35@4 for inferior to very choice.

Receipts for week, flour, bbls. 155,700; corn meal, do. 6,250; wheat, bush. 884,150; corn, do. 1,005,300; oats do. 275,400; rye, do. 60,000 bs; malt, do. 21,420; barley, do. 160,000 beans, do., 7,656; rice, pkgs. 4,400.

Exports for the week, flour, bbls., 91,300; corn meal, do. 2,400 wheat, bush. 706,200; corn, do, 896,725; oats, do., 2,600; peas, do. 2,050; beans, do. 709; rice, 700.

FRESH FRUITS.—Exports of apples for week 35,000 bbls. The market is quiet, and prime Winter fruit is going in store. For wholesale business the inside range is full; selections make outside figures which show an advance in Spitz. Lady apples have a wide range, $3@8 per bbl.

Western mixed lots, $1.12@1.37; Baldwins in shipping order, $1.37@1.50; Greenings, $1@1.25; Spitzenbergs, King $1.50@1.75; Pound Sweet, $1.75@2. Cranberries steady; sales retarded by mild weather. Cape Cod, fancy, $6.25; other $4@5; per boxes, $1.75@2.50; N. J., do. $1.25@1.75. Quinces cheap; small call. $1@2.00. bbl. Boston pears bush. box $2@6; Cal. $4.50@5 per case. Florida oranges $2@3 per h'f bbl. box; finer marks soon expected. Grapes in fair supply for the date. Catawbas cases $3.25@3.50; baskets 5@6½c.; Isabellas cases $1.50@1.75; baskets 3@4c. Peanuts dull and lower Va hand-picked per b. 4¼@4½c; other 3@3½c; shelled, 5@5¼c. Chestnuts per bush. of 60 lbs. $2; butternuts, 60@75c.; pecan 9@9½c.

GRAIN.—Wheat has been active and advancing; demand largely on speculative account.

Latest prices are of extra white at $1.19¼; No. 1 white at $1.17@1.17¼; do. November at $1.17@1.17¾; do. December at $1.18¾@1.19; do. Jan. at $1.20¾@1.21; ungraded white at $1.12¾@1.18; No. 2 white at $1.16; No. 2 red at $1.18¾@1.19¼; do. November, at $1.18¾; do. December at $1.20¾@1.21¾; do. January option, at $1.22¾@1.23¾; No. 3 red at $1.15@1.16; ungraded red at $1.12¾@1.21; choice hard No. 1 spring at $1.24; No. 2 Chicago spring at $1.16; ungraded spring at $1.14. Rye at $1.02@1.04. Corn is fairly active at irregular prices; latest sales are of New York No. 2 at, 58¾@59¼c.; do., November at 58¾@59¼c.; do., December at 59@59¾; do. January at 59¾@60c.; ungraded mixed Western at 58¾@60¾c.; No. 3 at 56¾@57¼c.; New York steamer mixed at 57@57¾c.; No. 2 white at 59½@60c. Oats are offered freely at easier prices; latest sales are of No. 1 white at 47c.; New York No. 2 white at 42@43¼c.; No. 3 white at 41@41½c.; New York No. 1 at 42c.; New York No. 2 at 41¾@42¾c. do. November at 41¾c.; do. December at 42½c.; do. January at 43¾@43¾c.; No. 3 at 40¾@40¾c.; ungraded white Western at 43@50c.; ungraded mixed Western at 39@42c.; No. 2 Chicago quoted at 42c.

HONEY.—Is in fair demand at late prices; best comb 18c.

HOPS.—There is a very good trade; the exports for the week reach 2,800 bales, and brewers buy to a fair extent. The country markets are up 1 to 3; but here prices are just firm. Quotations are for

	Cents per lb.
New Yorks, crop 1880, prime and choice	20 @23
Do. medium	18 @20
New Yorks, crop 1880, low to fair	16 @17
Eastern, crop 1880	16 @20
Wisconsin, crop 1880	16 @20
Yearlings, crop 1879, choice	16 @23
Olds, all growths	4 @12
Bavarians	30 @35
Bohemians	35 @40
Pacific coast, new	33 @25

HAY AND STRAW.—There is a liberal demand and a strong market. Quotations are for

Shipping hay at 90@95c.; medium to prime do., $1@$1.20; salt hay at 60@65c.; clover do. at 75@80c. Straw at $1@1.05 for long rye; 80@85c. for short rye; and 70c. for oat.

LEATHER.—Quotations are for hemlock sole, 22½@24c. for light; 23½@25c. for middle; 24@25c. for heavy, and 21@23c. for good damaged.

OIL CAKE.—Western is quoted $32 per ton.

POULTRY AND GAME.—Receipts are assuming a full volume, but the weather has been unsettled for large sales. The demand, however, seems to be opening and supplies have been pretty well cleaned up. Thanksgiving stock should be here by Nov. 23d if the weather is cold. Mixing fowls and chickens in the same package is again deplored by the trade. Dry-picked poultry has lost some of its firmness as prime quality of scalded now arrives regularly.

Turkeys, State and Western, choice, 12@13c.; fair to good, 10@11c. Phila., dry-picked, 14@15c. Chickens, do., 13@15c.; Bucks Co., 13@14c.; N. J., 12@13c.; State scalded, 10@12c.; Western, 10@11c.; poor, 8@9c. Fowls, Phila., dry-picked, 11½@13c.; N. J., d.-p., 11@12c.; scalded, 11@12c.; State do., 10@11c.; Western, do., 10@10½c.; poor to fair, 8@9c. Ducks, Phila. d.-p. 13@15c.; State scalded, 12@14c.; Western mixed, 11@13c.; very poor, 9@10c. Geese, Phila. 11@12c.; other, including Maryland, 8@10. Squabs, white, ₰ doz., $2; dark, ₰ doz., $1@1.25.

Live poultry has now only a chance sale, as city killers have mainly stopped operations. Opening sales have been good during a few days, but by night the decline has been sufficient to make a low average for owners.

Chickens, N. J., ₰ lb, 10c.; State and Penn., 9½@10c; Western, 9@9½c.; Southern, 8@9c. Roosters, 4@5c. Turkeys, N. J., 10@11c. Western, 9@10c. Ducks, prime, ₰ pair, 75c.; other, 40@60c. Geese, choice, $1.75@2; other, $1@1.50. Pigeons, 25@35c.

Game has not had a reasonable chance. With mild weather and poor showing stock the market has ruled unsettled. Wild ducks are low. Sportsmen at this season fill some of the demand that later on goes to the regular market. Quail are firm, being the newest item. Venison arrives in poor order, frequently sour.

Havre de Grace canvas back ducks, ₰ pair, $1.20@1.50; Norfolk, 50c@$1; red heads, 10@75c.; mallard ducks, 30@35c.; Broadville, 20@25c.; teal, 10@25c., the latter for blue-winged; common duck, 10@20c. Quail, prime, $1.50@1.75 ₰ doz.; poor, $1@1.25; partridge, 50@80c, the latter for prime State. Grouse, prime, 80@90c.; drawn, 60@75c. Woodcock, 40@50c. English snipe and plover, $1.25@1.50. Sand snipe, 25@30c. Rabbits, 25@30c. Venison, Minn., saddle, ₰ lb 12½@13c.; other 8@12c. Whole deer, 7@9c.

PROVISIONS.—Hog products have been moderately active at strong prices. Mess pork quoted at $15 for prompt delivery. Bacon at 7¾c. for long clear, and 8¼ for short clear. Beef at $18.50@19 for city extra India mess; $9.50 for extra mess in barrels, and $8.50 for plain mess, in barrels. Beef hams at $18.50@19. Tallow at 6¾@6¾ for prime; stearine at 9¾. Lard, Western steam at 8.75 asked; 8.60@8.62½ for November; 8.47½@8.50 for Dec. and 8.50@8.52½ for Jan.

Receipts for week, beef, bbls. and tcs.; 1,611; pork, 2,211 bbls.; cut meats, 47,689 pkgs.; lard, 24,805 pkgs.

Exports for week, beef, bbls. and tcs., 1,530; pork, 3,600 bbls.; cutmeats, 10,999,572 bs.; lard, 7,215,012 bs.

SEED.—Clover is quiet, quoted at 8¼@8c. Timothy is firm; quoted at $2.70@2.80. Flaxseed quoted at $1.40@1.42½.

Receipts for the week 5,120 bush. Exports, 451 bags.

TOBACCO.—Exporters have bought moderately and there is a very good home trade, with prices strong.

VEGETABLES.—Exports of potatoes for week, 8,600. Receipts have fallen off suddenly and though the export sales are light the market is firm for all good stock. Eastern Early Rose $1.75; bbl. Slate $1.50@1.65; snowflake, Burbank and prolific $1.50@1.62; peerless $1@1.25; sweet potatoes firm for choice; Phil. $2.25@2.50; other $1.25@2.

Tomatoes, ₰ bush., 75c.@$1; turnips, ₰ bbl., 40@50c.; Russia, 50@60c.; beets, 75c.; cabbage, flat Dutch, ₰ 100, $2.50@3.50; red, $3.50@4.00; Squash, Hubbard, ₰ bbl., 75c.@$1; marrow, 40@50c.; onions, white, $4.50@5; yellow, $3.25; red, $3.25; Chester, $3; carrots, $1@1.25; pumpkins, ₰ 100, $4@5; cauliflower, ₰ bbl. $1@$2; celery, per dozen, $1.00@1.25. Onions easier at the close.

WOOL.—The market is advancing and is quite active, manufacturers buying freely. X and XX Ohio at 46@47c.; pulled at 40c.; washed Med. combing at 33½c.; Spring California at 18@35c.; Spring Texas at 21@30c.; full do. at 21@27c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Nov. 13, 1880.

BEEVES.—Receipts for the week 11,328 head; do. last week 12,839 do. The week has been an uninteresting one for sellers. At the close the yard men tried to force prices, as there was a prospect of better beef-selling weather, but butchers fought them to their views and a decline of ¼c. is to be noted compared with Wednesday last. No Texans on sale. Rough Michigan oxen sold at 6¼c. to dress 54 lbs; poor to fair quality native steers, 7c. to dress 55 lbs; and 8¼c. to dress 56 lbs; good to choice, 9@10¼c. Poor State dry cows sold as low as 1¼@2c. live weight. The Board of Health seized a number of miserable dry cows that were offered for butchers' use; and it promises to keep a sharp lookout for those scrapings of poor farms and dairies, in the interest of the health of our citizens.

COWS AND CALVES.—Free arrivals meet a fairly ready sale, the range for the style of cows coming being $30@55 per head. Extras do $8@10 better when a special customer is in market.

VEAL CALVES.—Live calves have sold well, as dressed have spoiled badly during the warm days. Dressed to bring top figures must be strictly prime. Live calves, N. J., prime to choice 7¼@8c.; State, good to prime, 7@7½c.; other 5@6¼c.; Mt. Holly, heavy, 4¼@5c.; light, 6¾@7¼c.; buttermilk, 2¾@3¼c.; grassers, 2@2¾c.; dressed N. J. prime 10@10¼c.; State prime 9¼@10c.; fair to good, 8@9c.; common, 3½@5½c.

SHEEP AND LAMBS.—Receipts for week, 32,674 head; do. last week, 28,850 do. Common and medium grades of sheep drag; prime lots firm. Sheep quoted 3¾@5¼c.; a few extras, 5¾c. Lambs, poor to prime, 4¾@6¾c.

SWINE.—Receipts for the week, 44,400 head; do. last week, 31,408 do. Market dull at $4.60@4.75 per 100 for live corn hogs. Country-dressed pressed for sale with adverse weather. New Jersey dressed, light, 7¼@8c; other, 5¾@7c; city dressed State 5¾@7¾c.; do. Western 5¾@6¾c; pork tenderloins, 9c.

HOPE FOR THE DEAF

Garmore's Artificial Ear Drums

PERFECTLY RESTORE THE HEARING and perform the work of the **Natural Drum.** Always in position, **but invisible to others.** All Conversation and even whispers heard distinctly. We refer to those using them. Send for descriptive circular.

The Companion

Aims to be practical, yet entertaining; bright, yet judicious; instructive, yet never dull; and by the variety, excellence, and comprehensiveness of its reading, it endeavors to interest all classes of readers. It will give during the year 1881,

Illustrated Serial Stories.

William Black . . . An Illustrated Serial Story.
J. T. Trowbridge, . . An Illustrated Serial Story.
Harriet Prescott Spofford, . A Story of School-Life.
Louise Chandler Moulton, . Tales for the Fireside.
Harriet Beecher Stowe, . . . Tales of Florida.

Travel and Adventure.

Archibald Forbes, the famous war correspondent of the *London Daily News*, will give personal incidents and adventures in camp and on the battle-field.
C. A. Stephens—A Serial Story of Adventure.—Illustrated.
W. T. Sprague—A Serial Story of Frontier Life.—Illustrated.
Travels and Adventures, in various countries, by U. S. Consuls.

More than Two Hundred Stories

By Regular Contributors and by new writers, among whom are:

Marion Harland, Saxe Holm, H. H. Jackson, Susan Coolidge, John Habberton, Frances M. Peard, Olive Thorne, Harriet Beecher Stowe, Louise Chandler Moulton, Elizabeth Stuart Phelps, Harriet Prescott Spofford, Charlotte Mary Yonge, Rebecca Harding Davis, Sarah Winter Kellogg, J. T. Trowbridge, Marie B. Williams, Rose Terry Cooke, Julia Eastman, Mary A. Denison, Ruth Chesterfield, A. H. Leonowens.

Popular Sketches.

Archibald Forbes will give sketches of Royal Personages, and of European Statesmen and Generals he has met on the battle-field and in other exigencies of military and political life.
Frank Buckland, the eminent English naturalist, will give papers upon his personal experiences in the study of animal life.
The Perils of a Diver's Life, or wrecking under the sea. By John Osborne.
Among the Boomerang Folk, and life in the Australian Bush.

Games and Recreations.

How to Make a Gymnasium, . By **Prof. D. A. Sargent.**
Lacrosse, Base Ball, Cricket, etc., . By **Henry Chadwick.**
Holiday Household Entertainments . By **G. B. Bartlett.**

Valuable Articles--Illustrated.

By **Prof. Richard A. Proctor**—Upon "Old and Young Worlds"—The Dog Star, and its Companions—Comets—The "Immensity of Space," etc., etc.—Illustrated.
By **E. P. Whipple**—Personal Recollections of Prescott, the Historian—Rufus Choate, and Charles Kingsley.—Illustrated.
By **James T. Fields**—Sketches of a Famous Group of American Authors, Cooper, Willis and Halleck.—Illustrated.
By **James Parton**—Women who have led society—Josephine—Catherine II.—Queen Elizabeth—Victoria—Mrs. John Adams, etc.
By **Mrs. H. O. Ward,** author of "Sensible Etiquette"—Upon the Etiquette of Common Life—Table Manners—Dress Toilet—Conduct in Public Places—Presents—Introductions—Letters—Notes—Duties of Visitors—Duties of Guests—etc., etc. Ten articles.
By **Prof. Luigi Monti**—Personal Recollections of Victor Emanuel and of Garibaldi—Incidents Illustrating the Duties of Consular Life.
By **Carlyle Petersilea**—The Music Student Abroad—His encouragements, his difficulties, his social relations and moral dangers.
By **Mary Clemmer**—Reminiscences of Public Life in Washington.

Poems.

John G. Whittier, James T. Fields, Edward Lear, Henry W. Longfellow, Paul H. Hayne, Edna Dean Proctor, J. T. Trowbridge, Sidney Lanier, Mr. and Mrs. Platt.

Practical Articles.

Opportunities in the West for Young Men, by E. P. Ferry, Governor Washington Ter.; M. Brayman, Governor Idaho; J. W. Hoyt, Governor Wyoming; and other Territorial State Officers.
Occupations for Women—Showing the ways by which Women and Girls earn Money. Teaching—Dress-making—Keeping a Little Store. Each article by a woman who earns her livelihood in the occupation she describes.
Frederick C. Shattuck, M. D.—What is to be done in ordinary sickness, before medical aid can be called—Also, Papers on Baths and Bathing—The care of the sick and of the sick-room, etc., etc.
I. H. Knight, M. D.,—Throat Diseases—their causes, and ordinary means of prevention.
James Upham, D. D.,—Best Suggestions of the Medical Journals.

Editorials.

Editorial Department—This department will contain Editorials upon current topics in art, politics, ethics and literature, with the brief editorial paragraphs that have proved so acceptable a feature during the past year.
Children's Department, for Youngest Readers. Beautifully Illustrated. The best authors and artists are employed in this department, and no effort is spared to secure the brightest things.

SPECIAL OFFER.

To any one who subscribes now, and sends us $1.75, we will send the Companion free to January 1st, and a full year's subscription from that date.

Subscription Price, $1.75. Specimen copies sent free.

Please mention in what paper you read this advertisement. Address

YOUTH'S COMPANION,
41 TEMPLE PLACE, Boston, Mass.

Reading for the Young.

THE WASP AND THE BEE.

In a garden sweet and fair,
Once a bright and busy pair
Held a brief conversation on a lily.
"Mr. Wasp," remarked the Bee,
"Your maneuvers puzzle me,
You must either be a lazy rogue, or silly.

"In the school where you were taught,
Was the fact before you brought
That our time is equivalent to money?
Now for days and days we've met
'Mid the pinks and mignonette,
But you never seem to carry any honey!

Said the Wasp: "You make me smile
With your blunt, outspoken style,
You have many things to learn, I must declare;
For a thousand sunny hours
You've been pumping at the flowers,
And you never dreamed of poison being there.

"From the phlox and columbine,
Bleeding heart and eglantine,
Soon your treasury of honey-comb you fill;
While I, coming in your wake,
From the self-same blossom take
All the rankest sort of poison by the gill.

Let me whisper in your ear:
I have found while roaming here
Over garden, over orchard, over field,
That the fairest growths of flowers
Which adorn these haunts of ours,
The most deadly kind of poison often yields."

"Bless my sting!" exclaimed the Bee,
"Every day we live to see
Will some wonder carry with it, I suppose.
Who would think a nauseous drug
Could be stored away so snug,
In the heart of such a blossom as the rose?"

And, with that it flew away,
To a field of blooming hay,
On the buttercup and clover to alight:
While the Wasp set out to find
Something suited to his mind,
And was soon in a camelia out of sight.

FARMING FOR BOYS AND GIRLS.—NO. 4.

HENRY STEWART.

The Air and its Uses in Agriculture

THE AIR serves a most important purpose in the growth of plants. Out of 100 parts of the weight of plants grown as farm crops, 95 to 99 of these parts are derived from the air, in one way or another. Every person, then, who lives on a farm ought to know something about this very needful substance. The air surrounds us in every direction; it penetrates into every space, no matter how small. It cannot be seen, yet it possesses color, for the beautiful light blue of the sky, and the deep blue which bathes a distant mountain, are really caused by the air through which our sight passes, just as when we look through a piece of colored glass every object appears to be of the color of the glass. Air has weight. Its weight can be felt when we stand in a strong wind, for wind is only air in motion, and the force with which the breeze presses upon our bodies, or upon any other object, is nothing more or less than the weight of the air increased by its motion; just the same as the force of a ball which strikes the hand consists of its weight multiplied by its motion or velocity. The weight of the air is known to be 538 grains, or one ounce and 58 grains (nearly one ounce and a sixth of an ounce) to each cubic foot, so that a room 40 feet square and 18 feet high would contain about a ton of air. Knowing the weight of air we can tell very nearly how much of it surrounds the earth, that is, its hight above the ground, because we know that a column of it exactly one inch square weighs just 15 pounds. It is because of its weight that it forces itself into every crevice and opening, however small, and penetrates into every part of the soil, filling every space between the particles, unless it is dislodged and forced out by water. When, however, the water sinks into the soil or dries out of it, the air immediately fills the space again. The air consists of a mixture of two gases, oxygen and nitrogen, or very nearly 21 parts of the former and 79 of the latter in bulk. The weights of these two gases differ, for in 10,000 pounds of air there are 2,317 pounds of oxygen to 7,683 pounds of nitrogen. These gases are mixed together only, and do not form a union; in a similar manner to that in which a quantity of rye and wheat might be mixed together and still remain separate in reality so far as the individual grains are concerned. The air also usually contains several substances which exist in it as impurities, and are derived chiefly from the decay of organic matter. These are carbonic acid, ammonia, and nitric, nitrous, and sulphurous acids. These occur in very small quantities, the first being the most abundant, but yet there are only four parts of it in 10,000 of air. Nevertheless this small quantity exerts, and has exerted, a most wonderful effect on vegetation, for it has been the principal substance which has entered into and formed the plants which have, in their decay, produced the vast beds of coal and peat, whose total quantity is far beyond the power of the mind to conceive.

The air also contains about one part in 100 of water in a state of invisible vapor; dissolved in fact, and as imperceptible to the sight as salt or sugar are when dissolved in water. Warm air can hold more water than cold air; when the air is cooled the vapor invisible before, becomes perceptible, and forms fog or clouds; when the cold becomes greater the vapor is still more condensed, the small particles join together and fall in drops as rain, or if the cold is very great, crystals of beautiful shape form and fall as snow. All these peculiarities of the air render it very useful to the farmer, for if the air were dry there would be no rain, if it were pure there could be no vegetable growth, for the principal part of a dried plant is derived from the carbonic acid of the air, a substance in itself that could not be breathed by an animal for one minute without sudden death; and the ammonia and nitric acid are also very necessary to plant growth. Besides these, the oxygen of the air is needed to support plant life. It is required for the first sprouting of the seed; its presence is necessary to enable the first tiny rootlets to absorb, and the first weak leaves to digest and convert into plant substance, the food which exists in the soil; not a single bud can open without the needed supply of oxygen, and this gas is also necessary to enable the plant to unfold its blossoms, and it endows these with their delicious fragrance: it gives sweetness to some fruits, an agreeable acid to others and it performs an essential service in the ripening of the seed. From the birth to the death and decay of a plant, oxygen is always serving an active purpose, and as animals could not exist for one moment without it, so plants would never exist in its absence. This furnishes one of the many analogies which exist in the life and growth of both animals and plants.

Let us consider for a moment how useful it is for a farmer or gardener to know of these facts in regard to the air which surrounds us. Let us consider a corn field in the Summer time. A shower has fallen and as the hot sun has quickly dried the surface of the soil, it has become baked, hardened and encrusted. No air can penetrate. The corn is deprived of its needed supply of air. The roots cannot take in their nourishment; the circulating sap is not able to change its burden of food into life giving elements; the leaves droop, curl and become pale, the plant is suffering and no longer grows; it simply exists, sickly and weak. The farmer comes with his cultivator and loosens the ground and destroys the hardened crust upon it. The air instantly circulates through the mellowed soil, the roots go to work with vigor, the plant breaths and feels again, and the observant farmer noticing the improvement, sees that the cultivation of the soil is of great advantage to his crop; but why it should be, he cannot tell and does not know, unless he understands the nature of the air and its wonderful influences upon plant growth.

A FAITHFUL DOG.

EVERY one will remember the Mill River horror of a few years ago and the bursting of a reservoir among the hills, above Williamsburg, Mass., which brought desolation and death to so many homes, and laid waste entire villages.

Riding about four miles below Williamsburg a short time ago, when a fellow passenger remarked, pointing to a clump of trees by the river side.

"I shall never forget a scene I witnessed there during the search for bodies after the Mill River disaster some years ago. The drift wood and debris had made a deposit beside that tree nearly twenty feet in depth and there I saw a large dog crying pitifully. As we drew near we found that the dog was fastened down by a stick of timber and unable to move. His eyes were like balls of fire and he was fearfully emaciated. At first we feared to go near him, but finally released him and gave him some food. He dropped the food looking down and whining.

'Some one is here,' one of our company said, and we commenced digging, and while doing so the dog lay very quiet, but the moment we ceased he seemed to grow almost frantic. When we commenced digging he laid down again but no effort would induce him to taste the food before him. At last after hours of labor we found the body of an old man, and a little later a little boy, over which the faithful dog had been keeping watch. The joy of the poor brute was great but the food which he had so generously refused would never be eaten by his young master.

This story interested me greatly, said my friend, for I knew the dear little boy who went out with his faithful dog to the meadows that dreadful morning and the kind old man, his grandfather, who hearing that the terrible flood was coming went out to seek him. They were all swept away, but the marvel was how they kept together during that fearful four miles and how the poor dog should know they were buried deep below him. He had not tasted food for a week, but he will never know want again. The family so terribly bereaved reside in Boston now, but the heroic dog is boarded in Williamsburg where the friends over whom he kept such faithful watch are sleeping."

MRS. E. J. R.

GIVE THE BOYS TOOLS.

ALMOST all boys are naturally mechanics. The constructive and imitative faculties are developed in part, at a very early age. All boys are not capable of being developed into good, practical, working mechanics, but most of them show their bent that way. There are few cases in which the boy has no competent idea of the production of a fabricated result from inorganic material, but such cases are. Given the proper encouragement and the means, and many boys whose mechanical aptness is allowed to run to waste, or is diverted from its natural course, would become good workmen, useful, producing members of the industrial community.

The mechanical boy ought to have a shop of his own. Let it be the attic, or an unused room, or a place and tools. Let him have a good pocket knife, gimlets, chisels, gouges, planes, cutting nippers, saws, a foot rule, and material to work. Let the boys have a chance. If he is a mechanic it will come out, and he will do himself credit. If he fails he is to follow some calling that does not demand mechanical skill.

ALLIGATORS' NESTS.

THESE nests resemble haycocks. They are four feet high, and five in diameter at their bases, being constructed with grass and herbage. First, they deposit one layer of eggs on a floor of mortar, and having covered this with a stratum of mud and herbage eight inches thick, lay another set of eggs upon that, and so on to the top, there being commonly from one to two hundred eggs in a nest. With their tails they then beat down round the nest the dense grass and reeds, five feet high, to prevent the approach of unseen enemies. The female watches her eggs until they are hatched by the heat of the sun, and then takes her brood under her own care, defending them, and providing for their subsistence. Dr. Lutzenberg, of New Orleans, told me that he once packed up one of these nests with the eggs in a box for the Museum of St. Petersburg, but he was recommended, before he closed it, to see that there was no danger of the eggs being hatched on the voyage. On opening one, a young alligator walked out, and was soon followed by the rest, about a hundred, which he fed in his house, where they went up and down stairs, whining and barking like young puppies.—Lyell, the Geologist.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I did not receive any seeds but I thought I would tell you of what flowers I have. I have quite a variety of flowers, of which I will name: Phlox, Drummondii, Sweet Mignonette, single and double Chinese pinks, single and double Japanese pinks, and the Heddewigii Pink, balsams, cockscombs, snap-dragons, petunias, coreopsis, pansies, China asters and morning glories. My pinks have done grandly; there are some of them which measures two and one-half inches in diameter. The phlox was one mass of beauty. I never had such a mignonette before. It seemed as if it would smother itself in its rapid growth. My cockscombs and China asters are beginning to be beautiful. My balsams are quite large and handsome. My snap dragons are indeed beautiful; more so than ever before. My petunias have done finely—but my pansies did not do very well as it was very dry, but I tried to be faithful in watering them. We had a coreopsis which came up last Fall, and wintered nicely. We transplanted it quite early. When it commenced blossoming, which was the first of June, it measured three feet four inches in hight, and three feet in diameter. On the 4th of July it had 109 blossoms on it, each blossom as large as a 50 cent piece, and several times since then it has had 200 blossoms on it at one time. Some neighbors and friends whom I thought were superior florists were looking at my bed and I was regretting that the drought pinched it, they said they did not see how it could be any handsomer. Will you please give me the botanical name of what is commonly known as camphor plant. Your affectionate niece, PETUNIA.

[Cinnamomum camphora is the botanical name of the green-house plant known as camphor tree.—U. M.]

DEAR UNCLE MARK:—I will give you and the cousins my experience in sweet-potato growing away up here in Northern Vermont. Last Spring I purchased of B. K. Bliss & Sons, of New York, 100 sweet potato plants of the Early Golden variety; these I planted three feet apart each way, putting three plants in a hill. Owing to the dry weather about one-fourth of these died; from the remainder I dug one bushel and a peck of potatoes. Whether this is a large or small yield I do not know, but I think it would pay well to raise them at 75 cents per bushel if they yielded at this rate. I take great interest in reading the RURAL, especially the horticultural columns, and should miss it very much if I did not have the reading of it.

Yours truly, W. H. RAND.
Chittenden Co., Vermont.

[To succeed well in the more northern States there should first be a ridge constructed by turning two furrows of earth over well-rotted manure, and after this ridge is nicely smoothed and rounded the plants should be set from 10 to 15 inches apart and kept carefully weeded. One hundred and fifty bushels to an acre would be a fair yield. —U. M.]

DEAR UNCLE MARK:—Many thanks for the seeds you so kindly sent me. They all grew finely and flowered beautifully. The portulaca were very pretty and of six different colors. Every seed of the musk-melon grew and was a surprise, indeed. They were the best we ever had. I have saved the seeds from the best ones to plant next year. I am interested in the letters from the cousins, though I think some of them very careless with the seeds which require so much labor and expense, or they would take more pains to cultivate them and not say they failed to grow or they forgot to plant them, or neglected them in other ways, which showed they took little interest in their culture. We ought to take all the pains we can, for what is worth doing at all is worth doing well.

Your grateful niece, ALICE SPARROW.
Oneida Co., N. Y.

UNCLE MARK:—My mother takes the RURAL and we think it a splendid paper. We have only taken it this year. I should like to join your Horticultural Club if you will let me. The seeds you sent my mother all did well but the oats, we did not raise any at all. We raised a Mangold Wurtzel that weighed ten and one half pounds, and we thank you very much for the seeds and hope you will remember us again in the free seed distribution. Yours truly, MELLIE KING.
Dekalb Co., Ill.

UNCLE MARK:—My father has taken the RURAL for more than 20 years, and likes it very much. I am 13 years old and go to school. We live on the shore of Lake Champlain. I would like to join the Horticultural Club. I am much interested in the culture of flowers. We have a few, but they are not very choice. I think Edith would be a very pretty name for Mary Walker's little sister.

From your new cousin, S. B. H.
Washington Co., N. Y.

Sabbath Reading.

"GOD KNOWS."

[Some years ago a child's body was found on the South coast of England, having been thrown there by the waves. The parish clerk, on being asked what should be put on its grave, answered in perplexity: "God knows." This proved a fitting epitaph.]

Where the tear-fed violet blooms,
Where the shade of the sunbeam chases;
Where in mossy marble tombs
Sleep the dead beneath the daisies,
Where the mourner slowly wanders
When the bird has sought its nest,
And amid the gloaming ponders
Over those who tranquil rest;

Clouds across the crimsoned sky
Homeward gayly were careering:
But in that lone churchyard, I
Heeded not that night was nearing.
Discords in my bosom swelling
Broke the music of life's song,
For my soul was weary dwelling,
'Mid the over-earthly throng.

Far within the stilly shade
Of a quiet, sequestered corner,
Where the wild flowers bloom and fade,
Gently nurtured by no mourner,
Was a grave, an infant's only,
No one knew the name she bore.
Ask the waves which, dark and lonely,
Cast her lifeless on the shore.

O'er the grave a humble stone
Reared its lichened head so lowly,
Like a sentinel alone,
Watching 'mid the silence holy.
Hither came the croaking raven;
From this stone its weird notes rose;
On its surface rudely graven
Were the simple words: "God knows."

As a moonbeam on the sea
Charms the sad wind's shrieks to singing
So these tender words to me
Turned my song, sweet solace bringing.
Though my thorn-strewn way was dreary,
Though my feet found no repose,
Yet my soul, life-worn and weary,
Rested in the thought: "God knows."

EXTRACT FROM A SERMON BY C. H. SPURGEON.

I was present at a meeting of believers a short time ago, when a conversation of this kind occurred. A brother in the Lord, one of the most fervent men I know, said that sometimes when his piety flagged, and his heart grew cold, he found it a very blessed thing to go and visit the sick and the dying; and he found this to be such a sweet restoration to his faith that he recommended us all, as often as we could, to frequent dying beds. Now, another brother who was present, who preaches the Gospel, but who at the same time is a butcher, said he thanked God he did not need to go to a dying bed to see Jesus, and to get his heart set right; that he had had as sweet fellowship with God in Camden Town Market, as he ever had in the house of prayer, and that he found it best always to live, as his brother wished to live sometimes—namely, always conscious of sin, and always looking to the sin offering.

Come to Jesus, then, as you came at first. Fly to the fountain always as needing constant cleansing—not as though you had not been washed, but still abiding, continuing in blessed recognition of your present cleansing that flows from the fountain filled with blood. It is very sweet to remember that the fountain we sing about as being opened in Jerusalem, is opened "for the house of David and for the inhabitants of Jerusalem"—not so much for sinners, though it is opened for them, as for saints—"for the house of David and the inhabitants of Jerusalem." Let us always be coming to it; and each morning and each night let this be the cry of our spirit, "Still guilty, still vile, still polluted, we see Jesus, and seeing Him, we know that we are saved."

Should not this, also, be the mode of our life in another respect? We are now disciples. Being saved from our former conversation, we are now become the disciples of the Lord Jesus; and ought we not, as disciples to be constantly with our Master? Ought not this to be the motto of our life, "We see Jesus?" We should not regard the commands of Jesus Christ as being a law left to us by a departed Master whom we cannot see, and to whom we cannot fly. Is it not better to believe that Christ is a living Christ, that He is in the midst of His Church still, observing our order, noting our obedience or our disobedience, a Master absent in one sense, but still in another point of view ever present, according to His promise—"Lo, I am with you alway, even unto the end of the world?"

THERE is a power in the soul, quite separate from the intellect, by which God is felt. Faith stands serenely far above the reach of the atheism of science. It does not rest on the wonderful, but on the eternal wisdom and goodness of God. The revelation of the Son was to proclaim a Father, not a mystery. No science can sweep away the everlasting love which the intellect does not even pretend to judge or recognize.—F. W. Robertson.

"UNDER whose preaching were you converted?" "Under nobody's preaching," was the pleasant, smiling reply; "it was under Aunt Mary's practising." The life that her aunt led before her was the means of leading her to the Savior. It was not what the aunt might have said, but it was what she did—her consistent example, which was the means of her niece's conversion.

DYING and death are two distinct things:—there is something gloomy and melancholy about dying, whereas death is nothing, but as it opens the way to glory—R. Watson.

TRUTH is in morals what steam is in mechanics—nothing can resist it.

PERSONAL ITEMS.

Senator Chaffee has presented his son-in-law, Ulysses S. Grant, Jr., $400,000 in government bonds.

Marcus Richardson, who was 100 years old on October 30th, voted at Bangor, Maine, the 2d inst.

Capt. R. F. Loper, the veteran steamship builder, died in Brooklyn on Sunday, 7th, in the 79th year of his age.

Ex-Congressman Lucien C. Gause, of the First Arkansas district, died at his home at Jacksonport, in that State, last week.

Judge Edward Rawle, a native of Pennsylvania and resident of New Orleans for 56 years, died on Friday of paralysis, aged 83 years.

Lucretia Mott, one of the most widely known philanthrophic workers, died at her residence near Philadelphia on the 11th, aged 88 years.

The property of Mr. Victor Newbomb, the retiring president of the Louisville and Nashville Railroad Company, is estimated at $6,000,000.

Garibaldi was utterly prostrated by his journey to Milan. His condition made a profoundly painful impression on the Milanese public. He was unable to receive anybody.

The bronze statue of Admiral Farragut, executed by Mrs. Vinnie Ream Hoxie and erected in Farragut Square, Washington, will be unveiled about the 10th of December.

Professor A. J. Gordon, of the Locustdale Military School, an eminent and widely-known teacher, died suddenly on Sunday, while attending church in Culpepper, Va.

Mr. Cyrus W. Field has ordered a Christmas dinner at Shanghai and expects to make New Year calls at Hong Kong. He will sail from San Francisco on the 18th instant.

General Thomas Ewing, who has been traveling for his health in the West, was suddenly seized with malarial fever at Columbus a few days ago and is now lying dangerously ill there.

Lord Lymington, eldest son of the Earl of Portsmouth, has arrived in New York. When asked the object of his trip to America he replied: "Oh, it's quite the thing now to do the States, you know."

Dr. Sarah E. Wilder, of the class of '79, of Boston University of Medicine, and Kate G. Mudge, of the class of '80, of the same college, are in Zurich, Switzerland, studying the German language, before going to Vienna, to engage in hospital and dispensary work.

Asthma Cured.

A well-known merchant of Hanover, N. H., whose wife had long been afflicted with Asthma, sent for the Compound Oxygen Treatment. After using it a little over a month he wrote:—"I thought I would write and tell you of the *wonderful effects of Compound Oxygen.* My wife was a very sick woman, coughing incessantly all day and nearly all night. Could get no rest at night until she used chloroform and alcohol, or chloral. Her sufferings during the asthmatic attacks were distressing in the extreme. * * *Now has no cough and no appearance of the Asthma;* is able to do considerable work, and we believe that when two months expire she will be a well person." Our Treatise on Compound Oxygen, with full information, sent free. DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

FOLDING CHAIR CO., New Haven Ct.

Implements and Machinery.

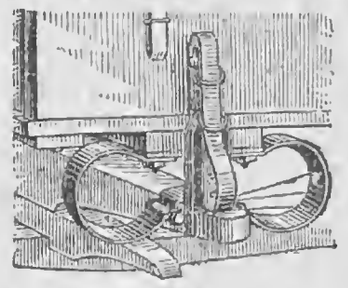
A Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.

It makes smooth and even lumber, leaves no stubshot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a larger mill. Send for descriptive circular, price, etc., to CHANDLER & TAYLOR, Indianapolis, Ind.

SOMETHING NEW!
PULLIAM'S PATENT
BOLSTERS SPRINGS for FARM WAGONS.



This valuable device is suited to wagons of any size—made of the best steel and warranted—are attached by four bolts through the bed—can be put on by any person. They remain on the wagon for all uses and work equally well whether with empty or loaded wagon. There is no use for a spring seat—they make a comfortable spring wagon out of a farm wagon—and save largely in wear and tear. We want Agents everywhere. Send for description and prices, and mention this paper.
TEMPLE & BIRGE MFG. CO., St. Louis, Mo.

WELL BORING, ARTESIAN WELL DRILLING & MINERAL PROSPECTING MACHINERY and how to use, is fully illustrated, explained and highly recommended in "American Agriculturist," Nov. No., 1879, page 465. Send for it. Portable, low priced, worked by man, horse or steam power. Needed by farmers in every county. Good business for Winter or Summer and very profitable. Makes wells in earth or rock anywhere. We want the names of men that need wells. Send stamp for illustrated price list and terms to Agents.
